In this section, we cover the following four basic interview-planning steps:

- Arranging the interview
- Researching the subject
- Formulating questions
- Arranging transportation

ARRANGING THE INTERVIEW

Before you arrange an interview, make sure the potential interviewee is an expert on the subject. Just because Ens. Isobar works in the weather office does not mean she knows the most about hurricanes and tornadoes.

Once you know who you want to interview, call that person and identify yourself by name, rank and office. Tell him what subject(s) you want to cover and suggest a time, date and location.

End the conversation by recapping the arrangements agreed upon. If the interview is more than a day away, contact him a few hours in advance to confirm the arrangements.

RESEARCHING THE SUBJECT

By this time, you should know the important role research plays in interviewing. Your audience expects you to be knowledgeable and the interviewee expects you to know about him or the topic of the interview. The more you know, the better will be your questions. In fact, it is a good idea for you to go into an interview knowing all the answers to the questions you will ask.

The following are some tips to help you research your subject:

- Check with the appropriate public affairs office for a biography or fact sheet if the story involves military equipment, a distinguished visitor or key officer. Also look for guidance regarding topics that might be sensitive in nature.
- Gather useful background materials at the library (magazine or newspaper articles, encyclopedias, reference books, technical manuals, etc.).
- Know where and how to find the point of contact for the subject.
- Seek local expertise at the appropriate agency and talk to these people about the subject or topic of your interview. (This adds depth and background to the program.)

Let your research material guide the interview, not control it. While conducting the interview, remember that you represent the audience who does not have the facts you have.

FORMULATING QUESTIONS

The key to a good interview is asking clear, concise questions. Determine the focus of the interview and formulate your questions around a primary idea. Be prepared to leave yourself open to new information you may not have known. You might have to switch your focus or incorporate new information into your final product.

Different types of interviews have unique approaches with varying question types. The length of time you have also determines the questions you can ask. If you have ample time, you can discuss the topic at length. On the other hand, if time is at a premium, word your questions to get to the point quickly.

Keep the following suggestions in mind when you formulate your interview questions:

- Ask open-ended questions — questions that cannot be answered with only a “yes” or “no” reply. For example, if you are interviewing the head coach of a football team, you would ask, “Describe your team’s attitude for today’s game,” instead of, “Is your team up for today’s game?” If you must ask a question that is answered by a yes or a no, ask the interviewee to explain his answers in more detail. Further, by using the five Ws and H as the first word in your

question, you assure yourself of more than a yes or no reply.

- Be simple and direct. Do not beat around the bush in asking a question or by asking multiple questions. This only confuses the interviewee and your audience.
- “Off-the-record” conversations are exactly that — off-the-record. Do not ask questions previously discussed in confidence during the interview.
- Avoid asking trite questions. For example: “Today our guest is Senator Spike Moss, Republican from Hawaii. How are you today?”
- Do not ask your guest embarrassing or antagonistic questions. For example: “Coach, you gave your catcher the steal sign with two outs and your team down by seven runs. He was thrown out easily at second base. This violates a basic baseball strategy even a 5-year-old would understand. Why did you do it?”
- Avoid using military jargon. If you must use jargon or acronyms, explain them. Do not assume your audience knows the topic as well as you and the interviewee know it.
- Do not comment on responses in trite ways or act surprised. For example: “I agree” or “You don’t say!”
- Use questions that will interest your audience. Ask yourself what it is they would like to know from the subject.
- Prepare more questions than you think you will need. This will ensure the best possible coverage of the topic.

ARRANGING TRANSPORTATION

“You can’t get there from here.” That is exactly what will happen if you do not plan your transportation requirements early. The availability of transportation varies from command to command. Regardless of whether your unit has its own vehicle or you rely on a motor pool, advance coordination is necessary. In some cases, the organization you are assigned to cover may provide transportation. However, you should not depend on it. Getting to the interview site is **your** responsibility.

EQUIPMENT CONSIDERATIONS

LEARNING OBJECTIVE: *Identify the equipment considerations that apply to radio and television interviews.*

You must pay particular attention to the technical aspects of interviews, especially those for television. As you discovered in chapter 14, any television production is a complex team operation, which means a lot of planning will go into the interview.

TELEVISION

As the talent of a studio interview for television, your involvement with the actual setup procedures (lights, cameras, etc.) will be limited. You must remain focused on the task at hand — preparing for the interview. (See figure 15-3.)

The opposite is true when you shoot interviews at remote locations. You will be accompanied by another member of the ENG team, and between the two of you, you must handle the duties on both sides of the camera.

The following is a checklist you can use to prepare for a television interview at a remote location:

- Check your equipment cables to make sure you have the right ones and they are all working.
- Check all batteries the day before the interview. If they are not sufficiently charged, you can charge them overnight.
- Pack a sufficient amount of videocassettes and make sure they are either new or bulk erased.
- Check the condition of the camera and the camera lens.

Figure 15-3. —TV studio interview.

- Run a test with the camera, recorder and microphones to make sure each component functions properly.
- Inventory all of your gear — the camera, viewfinder, cables, microphones, spare batteries, spare videocassettes, headsets, lighting gear and other necessary equipment.
- Run a test of the lighting kit to make sure it works properly.
- Check your transport cases and containers to make sure they are available and in good condition with working latches.

RADIO

Use the following checklist to help you prepare for a radio interview:

- Check the record and playback functions on your reel-to-reel or cassette tape recorder. Make sure you are recording at the right speed. If necessary, clean the heads or have it done by an engineer.
- Make sure the microphones are working and check the quality of the audio. You may have state-of-the-art equipment and the best technical crew around, but it is best for you not to leave anything to chance.
- If batteries are used to power the recorder or operate the microphone, make sure they are fresh and take along spares.
- If you plan to use AC current, make sure there is an electrical outlet close to the interview location and that the power cord will reach.
- Spot-check the playback after the interview to be sure you have something on tape, but do not give the interviewee the opportunity for a retake.

HELPFUL INTERVIEW HINTS

LEARNING OBJECTIVE: *Recognize the helpful hints used in radio and television interviews.*

You have selected the interview method and format, arranged the interview, researched the subject, formulated the questions, arranged transportation and checked your equipment. Everything is on track and pointing toward a successful interview. What else should you do?

Although not an all-inclusive list, the following helpful hints will make the difference between a good interview and a great interview.

BE PROMPT

Nothing is more exasperating than an interviewer who has little concern for timing. You should arrive at the interview site well before the scheduled time to set up the lights, camera and the recording equipment. When you are late for an interview, your subject may be less cooperative than he might have been, and in some cases, it may mean less time for you to ask all those important questions.

MAKE YOUR SUBJECT FEEL COMFORTABLE

If this is your subject's first interview, he will probably be nervous. Some common signs of nervousness include the following behaviors:

- Tapping one's pencil or fingers on the desk
- Infrequent or nonexistent eye contact
- Pulling away from the microphone
- Excessive stuttering or stammering
- Very short answers to your questions
- Frequent interruptions of your questions

Sometimes you can make your subject feel more comfortable by talking about other things, and therefore, take his mind off the interview. You can do this during a spot break for live interviews or at a logical stopping point for taped interviews. Furthermore, since everyone has a sense of personal space or a "comfort zone," you should select a seating arrangement that your guest finds comfortable. One caveat to this strategy is that you should not compromise the quality of the finished product in favor of comfort. Explaining your technical requirements to the interviewee will help.

BE ATTENTIVE

The most important characteristic of a good interviewer is being a good listener. Your subject will be more cooperative if he perceives that you are interested in what he has to say. Good eye contact and by your making the appropriate responses at the right time will show the interviewee that you are paying attention and want to know more about the subject.

Always listen to what your subject is saying. Some interviewers are more concerned about what they are going to ask, rather than what the subject is saying — **stay clear of this trap**. Interviewees occasionally answer the question you are about to ask, so be alert and adjust your questioning strategy accordingly.

By being an active listener and asking the appropriate questions, you can keep your interview on track and get the information you need in as short a time as possible. However, if you receive obscure, contradictory or confusing answers to your questions, ask follow-up questions to clarify the point. If the interviewee strays in his answer to a question, rephrase or repeat the question to get him back on track.

When you listen attentively, you also may pick up on a fact you did not know about and slip in effective follow-up questions.

Visualize the editing process while you are recording the interview. If your subject tends to ramble when answering questions, pay close attention to the responses to know when the question is answered, and therefore, when you can edit.

APPEARANCE

Your personal appearance is always important, whether in your day-to-day duties or when you conduct interviews for radio and television. Any violation of Navy uniform regulations, grooming standards or body fat guidelines is particularly obvious on camera and will be noticed by hundreds (or possibly thousands) of people. Your appearance can enhance your credibility or detract from it, so check your appearance thoroughly before the interview.

POST PRODUCTION

LEARNING OBJECTIVE: *Identify the procedures used to wrap up radio and television interviews.*

Once you have completed talking to the interviewee and you are back at your studio or office, immediately review the interview tape while it is still fresh in your mind. The following tips will help you put together your program or story with better efficiency:

- Make a run sheet for your radio interview listing questions, answers and good edit locations. Before you preview the footage for your television interview, reset the tape counter to zero, then log each scene on a shot sheet by number in the order it appears on the tape. Check for acceptable audio, video and picture composition.
- Be certain your topic does not violate security or the policies stated in *PA Regs*. Your interview must not be libelous, violate host country sensitivities (if you are assigned overseas) or breach an individual's privacy.
- Make sure audio levels match at edit points.
- Protect the credibility of the interviewee. Since it is possible for you to delete, add or rearrange words, sounds, sentences and entire paragraphs while editing the interview, be especially careful not to change the meaning of what the interviewee has said.
- Make a final check of the finished product before you give it to your supervisor. Examine the content. Does the interview tell the story? Are the questions answered? Is it concise and interesting? Is it factual? Check the technical quality of the final product for clean edits and good audio or video.

CHAPTER 16

PUBLIC AFFAIRS OPERATIONS

The previous 15 chapters of this NRTC covered the three primary functional areas of the Journalist rating — print journalism, photography and electronic journalism (radio and television). The fourth area, public affairs office operations, is considered a separate entity by many in the rating, yet it often incorporates elements commonly found in the other divisions. For instance, when you prepare a command presentation (explained later), you apply the same knowledge used to write a video news release (covered in chapter 14).

As a junior journalist, your first public affairs experience will probably be aboard ship (aircraft carrier, destroyer tender, etc. or at a large shore command). You should be aware that no two public affairs offices are organized the same way, because every command has a different mission, size and public affairs objective. However, most large public affairs offices are divided into the following departments:

internal information, media relations, community relations and administration. Figure 16-1 shows a typical public affairs office organization chart.

As you learned in chapter 1, you may work for a collateral-duty PAO (an officer who has other assignments that are considered primary duties). In this situation, the public affairs office “staff” may consist of you and perhaps a YN3 or civilian secretary. Conversely, a larger public affairs office ashore may have a full-time 1650 PAO (usually a commander or a captain), a JOC or above as LCPO, a JO1 or JO2 as LPO, and a combination of JO3s and JOSNs. At commands ashore, there also may be one or two civilian assistants to the PAO handling everything from secretarial duties to media embarks and community relations.

Regardless of the manning situation in place at your command, you soon will realize that every public

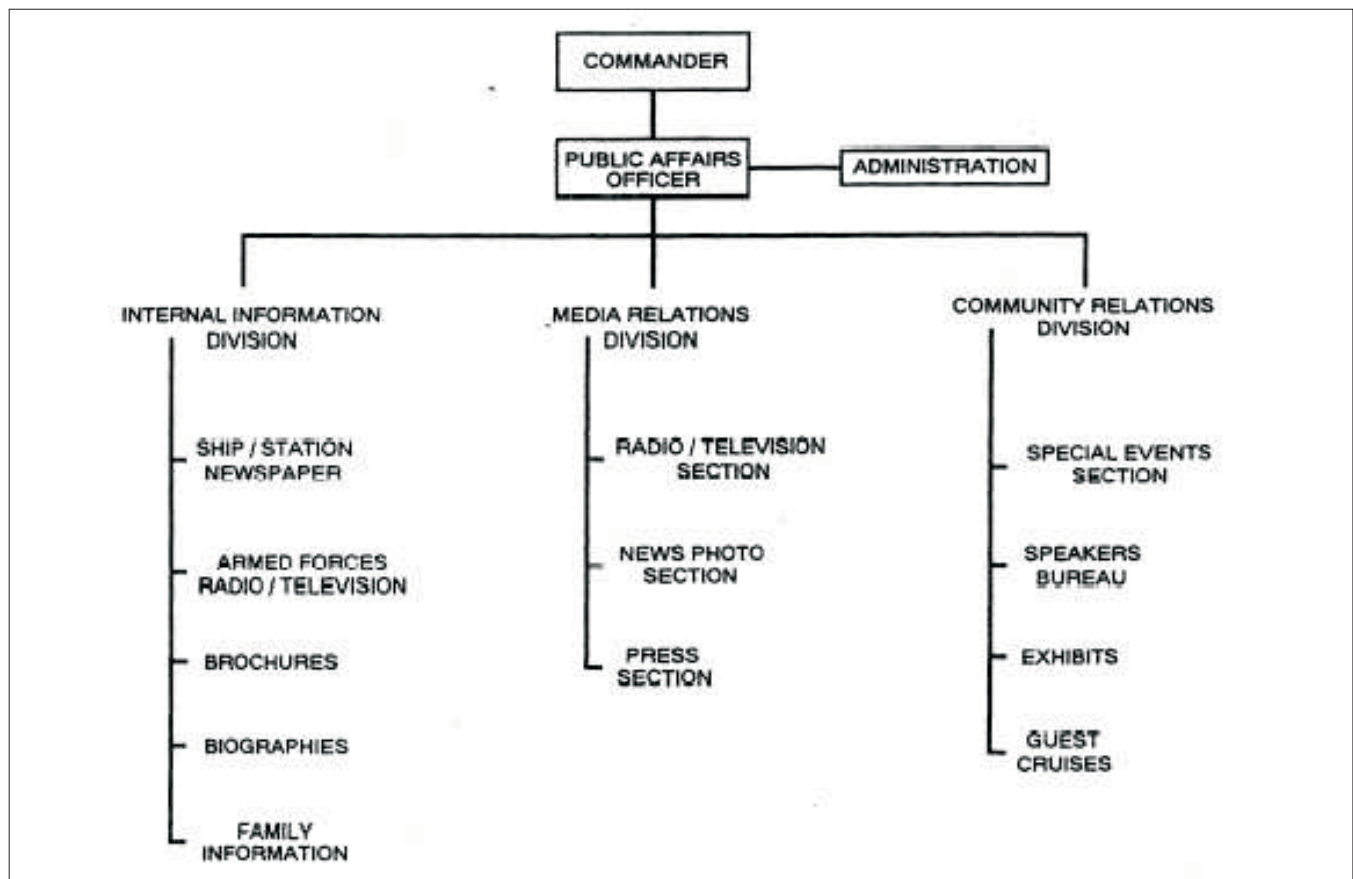

Figure 16-1.—Public affairs office organizational chart (large).

affairs office brims constantly with activity. Your versatility will be stretched to its maximum potential as you handle a myriad of tasks, including (but not limited to) the following:

- Maintaining and updating the command's web site
- Drafting naval letters
- Maintaining office files
- Preparing command welcome aboard information
- Writing the command history
- Writing command presentations
- Writing command/flag officer biographies
- Escorting members of the media
- Conducting tours
- Maintaining and inventorying public affairs office equipment

Do not let this list intimidate you. When you combine the knowledge you have gained from reading this NRTC with plenty of hands-on experience and office training, you will be successful in your public affairs office endeavors.

COMMAND WEB SITES

LEARNING OBJECTIVE: *Identify the requirements for developing and maintaining a command Internet web site.*

With the introduction of the Internet in the 1990's, the method of communicating from command to command, and person to person, changed dramatically. Today, nearly every public affairs office has at least one computer system dedicated full-time to serve as the command's official link to the outside world. Through the Internet, commands are able to send and receive correspondence, conduct research, interact with civilian and government agencies and manage community relations and public affairs programs.

INDIVIDUAL COMMAND WEB SITE

- A command's personal web site, if properly registered with the office of the Chief of Naval Information (CHINFO), serves as an excellent

Figure 16-2—NETPDTC command home page.

tool for promoting your command - and your people - within the civilian sector.

- Command web sites vary in style, content and design, but all are tasked - by instruction - to appear like a command's Welcome Aboard Brochure.
- Links to the Navy's homepage, Navy recruiting and the next senior command are encouraged to be included. Links to civilian sites are prohibited.

PRIVACY AND THE INTERNET

Posting of command information, whether intended for the internal or external audience, takes on special consideration when it is posted on a web site. Since the Internet is accessible by anyone, anywhere in the world at any time, it is important that the information you post on your command web site is cleared for this type of release. The right to privacy for all members of your command remains one of the most stringent requirements to posting information that is accessible to the global electronic community.

WEB SITE DESIGN

As you can see in figure 16-2, a command's homepage, or web site, should be designed so that is pleasing to the eye and not crowded with needless information; when it comes to designing home pages, the simplest design is preferred.

Items that should be included but not limited to are as follows:

- Command historical data

- Background information about your commanding officer
- Lodging and messing information
- Upcoming command special events
- Copies of recent command news stories
- Information about the local community
- Question and answer section

Links to official Navy web sites, such as the next senior command and the official Navy site, are also encouraged.

THE NAVAL LETTER

LEARNING OBJECTIVE: *Identify the components of a standard naval letter.*

One of the most important tasks you will perform in the public affairs office is drafting the naval letter. Whether responding to “fan mail” (a request for a welcome aboard booklet, photographs, etc.) or a media query, your letters must be letter-perfect and grammatically correct.

STANDARD NAVAL LETTER

The format of a standard naval letter is shown in figure 16-3. As you can see, it does not contain a salutation or complimentary close, because it is used to communicate with other naval commands and agencies within the DoD. All margins and space between headings and paragraphs are standardized. Punctuation is used as sparingly as possible.

The body of a naval letter contains the substance or essential facts of the communication in simple, concise, impersonal and tactful language with no repetition. Each paragraph should express **one** complete thought in logical sequence. If tables, diagrams or sketches are needed to add clarity to the letter, you may include them as separate enclosures. When you draft a letter in reply to another letter, make sure you answer **all** questions — whether expressed or implied by the writer.

Use tact when you draft a letter for the superior of the person who will sign it (for example, a letter from your CO to the admiral). In this situation, the skipper will **invite attention** to a special matter; he will not **direct attention** to it.

BUSINESS LETTER

The business letter (fig. 16-4) is used to correspond with agencies or individuals outside the DoN or DoD who are unfamiliar with the standard naval letter. It may be used for correspondence between individuals within the Navy when the occasion calls for a personal approach.

Whether you are preparing a standard naval letter or a business letter, always double-space the rough draft to allow for corrections and other notations.

More detailed information on naval letters and other types of correspondence may be found in the *Yeoman 3 NRTC* and in the *Navy Correspondence Manual*, SECNAVINST 5216.5

ELECTRONIC MAIL

You should treat all mail that you receive electronically, both through the command web site and by FAX, as though you received it in the regular mail. This type of correspondence may seem more unofficial - but it isn't. In fact, many times, correspondence may be sent by FAX or e-mail simply because it is more timely, and therefore, needs a more timely response. It may also be an official naval letter sent as an attachment. In any case, these types of correspondence, and your replies to them, should be printed in hard copy, numbered and filed as if they were routine correspondence received through the mail. This will ensure that you always have an alibi file on hand of correspondence you have received and correspondence you have sent.

ADMINISTRATIVE AREAS

LEARNING OBJECTIVE: *Identify the main administrative areas in a public affairs office.*

Now that you know the basic formats of the two most common naval letters, we will take a look at the main administrative areas of a public affairs office.

FILES

The success of any file system can be measured by your ability to file material correctly so that anyone in the office can locate it promptly. Further, your files must be kept current and not allowed to age in the in-basket on your desk.

The amount and variety of files maintained in your office depend largely on the mission of the command and the tasks handled by your office. Since

- Photographic file
- News release file
- Fleet Home Town News Program file

Command File

The command file contains reference material concerning the command, including the command history and statistics; biographies of the CO, XO, C/MC and other senior people of the command; and records of change of command ceremonies. These materials are used primarily for inclusion in welcome aboard booklets and media information kits. Additionally, you should devote a separate portion of the command file to any appropriate historical documents, such as previous command awards or old newspaper clippings.

Media Relations File

The media relations file contains a listing of all media in the local area, including the names, addresses and telephone/facsimile numbers of military beat reporters and news directors. It also includes information regarding deadlines, broadcast times and special requirements for copy and photographs. Some commands subdivide their media listing to reflect local commercial media and local military media.

Community Relations File

The community relations file exists to help PAOs plan effective community relations programs. It contains the names, addresses and telephone numbers of civic leaders and community groups with which the command maintains contact. The community relations file also should contain a study of the community and pertinent facts.

Project File

The project file contains past, present and future public affairs projects involving the command. It concerns such special events as general public visitations, military parades and ceremonies, holiday observances and dependents' cruises. This file also contains the planning information (letters, memos and miscellaneous notes) that pertains to each project. You can use information in this file as reference material when a similar event is scheduled at a later date.

Speech File

The speech file contains copies of all prepared speeches and other presentations delivered by members of the command in connection with the command speakers' bureau. It also contains background material for future speeches, such as the *Navy Fact File* (NAVSO P-3002) and *Navy Talking Points*, a collection of authoritative information on important Navy issues.

Future File

The future file contains a current listing of all events that have been scheduled or planned for the future, such as a general public visitation, change of command or VIP visit.

Matters Pending File

The matters pending file contains notes and reminders on pending ideas that may be useful for news releases, feature stories, news pegs for special events and other public affairs activities. This file also contains reminders on matters to be discussed at staff meetings, conferences and consultations with the CO or XO.

Correspondence and Memos File

In many commands, all official correspondence is filed centrally in the administration office. However, some commands operate a decentralized filing system with each department or office taking responsibility for correspondence under its cognizance. Regardless of where your public affairs correspondence is filed, you should become familiar with the filing system. If you need a letter or a memo from 5 months ago, you should know where to find it — the actual location of the files is inconsequential.

Keep two copies of all outgoing correspondence originated by your office and signed by the PAO — file one in the master outgoing correspondence file and the other in the related subject or project file. If the correspondence originates at your office, but is signed by the CO or another officer "by direction," maintain one copy in the appropriate file.

Incoming correspondence that directly affects a current or future project should be filed in the public affairs office. Make a copy of all incoming correspondence dealing with public affairs. If your

files are complete, you will encounter fewer problems later on.

In addition to filing correspondence properly, keep in mind that correspondence routing and control also are very important. Incoming correspondence and other paperwork first goes to the PAO, who then routes it to the appropriate staff member. If correspondence is routed to you for action, make sure you follow through on it without being reminded. If it is routed to you for information purposes only, keep it moving. Do not let correspondence gather dust in your incoming basket!

If you pick up incoming correspondence from the administration office or the mail room, attach a routing slip to each individual letter/memo and place it in the PAO's or senior journalist's incoming basket as soon as possible.

Alibi File

The alibi file contains copies of news advisories released to the news media. A news advisory is a shortened form of a news release intended to get the news media to cover an event themselves. This file also contains query sheets that document the oral release of information. News media queries are covered later in this chapter.

If the PAO is questioned about a news advisory or a query sheet, he can use the alibi file to justify the action taken.

Although a separate file, the news release file (covered later in this section) is another type of alibi file.

Clip File

The clip file contains clippings of stories that have been released and have appeared in print. Normally, the public affairs office has subscriptions to all local printed media to which material is frequently released. One of your first tasks each morning might be to screen and clip the daily papers for articles about your command or the Navy. PAOs and senior journalists use these clips to evaluate the effectiveness of public affairs programs and to plan new ones. In addition, they can determine easily how many news releases are being used in a week, month or year.

Make sure each clip is cut from the source as straight as possible, and center mount it on an 8 1/2- by 11-inch sheet of plain bond paper using a paper adhesive, preferably rubber cement. Stapling or taping the clip to the backing sheet will not give you a professional product.

In either the upper left or upper right-hand corner of the clip sheet, type the following information: (1) name of the publication, (2) date of the publication and (3) the page number in which the clip appeared. Make a notation if the clip extended over more than one page.

Photographic File

Good photographs are always in demand. If you are attached to a ship, you should stock 8- by 10-inch photographs or digital images of the ship underway, such as the three-quarter aerial bow photograph shown in figure 16-5. At a shore command, you should have 8- by 10-inch photographs of several points of interest.

Figure 16-5.—Three-quarter aerial bow photograph of bomb-damaged USS *Cole* (DDG 67) being towed into open sea by the USNS *Catawba* (T-ATF-168).
(DOD Photo by Sgt. Don L. Maes, USMC)

Aircraft squadron PAOs usually have on hand photographs of its planes in flight (fig. 16-6) along with general scenes of squadron structures, such as hangars and other points of interest.

In addition to photographs of hardware, you should carry photographs to accompany the biographies in the command file. Usually 4- by 5-inch black-and-white head and shoulders shots will satisfy the needs of most news media. However, you will need 8- by 10-inch black-and-white and color photographs for magazines and media kits.

Make sure the photographs are current. If your CO advances from commander to captain, you must have several copies of the new photograph on file.

Every public affairs office accumulates several miscellaneous photographs. If you think the photographs can be used at some point in the future, create files for them. When you file photographs, file them under general subject headings, such as “Carrier Operations,” “Sports” and “Sea Evolutions.”

You cannot maintain a good photographic file without the support of your command imaging facility. Make sure you build a good working relationship with the Photographer’s Mates or their civilian counterparts.

News Release File

Your news release file should contain the original news releases distributed to the media. As you learned in chapter 7, a release number is normally assigned to all outgoing stories — for example, the first release of

2002 would be 1-02 the second would be 2-02, and so forth. Start a new news release file at the beginning of each year and file the most current release on top.

Fleet Home Town News Program File

You should maintain a 90-day log book or index file of each release form mailed to the Fleet Home Town News Center (FHTNC). In addition, we recommend that you copy and file every release form that is part of a whole file. The Fleet Home Town News Program and the FHTNC will be covered in chapter 17.

Filing Tips

To help maintain your files properly, consider practicing the following tips:

- Label your file drawers neatly so its contents can be identified quickly.
- Give your files room to breath. Do not cram news releases, photographs and so on, into files and risk irreparable damage.
- File material in the proper folders.
- File papers facing forward in chronological order, with the latest date on top.
- Use standard file fasteners, rather than staples, to bind papers.
- File papers so the edges do not protrude beyond the edge of the folder.

Figure 16-6.—Three U.S. Navy F-14B Tomcats patrol the sky over the Persian Gulf.

(Photo by Lt. Bryan L. Fetter; USN)

COMMAND WELCOME INFORMATION

Your command welcome information is normally in the form of a welcome aboard booklet (fig. 16-7). The booklet familiarizes visitors and guests with your ship or station and usually contains the following items:

- A photograph of the ship (for shore stations, a photograph of the main gate or other familiar points of interest)
- A welcome letter from the CO
- A mission statement
- A brief history of the command
- A list of unclassified statistics and facts

The format of a welcome aboard booklet varies from a single-sheet trifold to an eight-page layout. Most editors of welcome aboard booklets use 60-pound cover stock for the front and back covers and either a four- or eight-page layout (saddle-stitched). Your particular design will be determined by the available funding and the amount of information you have.

If your ship is scheduled to deploy, you may have your welcome aboard booklet translated into several different languages. For further information, write to the Commanding Officer, Naval Technical Intelligence Center (NTIC DS32), 4600 Silver Hill Road, Washington, DC 20389.

COMMAND PRESENTATION

The command presentation often makes the first and most lasting impression on your visitors. You can deliver it in a command conference room or at a civilian auditorium or banquet room during a community speaking engagement.

Thanks to modern technology, most command presentations are composed on a personal computer using digital photos or slides, individual graphics and narrated live from a script. Some presentations, depending upon the resources available, are composed and edited to include audio, thus eliminating the need for a narrator. In other cases, presentations may be accompanied by either overhead transparencies, charts or 35mm slides. Some are recorded on videotape and have the same characteristics as a video feature story. Updating a command presentation on videotape takes time and it may not be suitable for viewing by large audiences.

Planning

Before you begin work on a command presentation, ask yourself the following questions:

1. What is the objective of the presentation? (Increase community awareness about the command? Tell how the command contributes to national defense? Familiarize newly reporting personnel?)
2. Who is the target audience? (VIPs? Active-duty military members? Local residents?)
3. What format should I use?
4. What resources are available?

Answering these questions in advance will let you determine how technical you can get, what to emphasize and how to arrange the information.

Organizing

A typical command presentation begins with a description of the unit, its overall mission and brief history. It then progresses quickly to the present tense and describes what the unit does and how it does it (in detail). The way your command is organized provides a logical outline for the order of your command presentation. Start at the top and work down, illustrating your script with visuals. Try to avoid too many images of static objects. People actually doing their jobs will stimulate interest and tell the story most effectively.

Scripting

When you formulate your command presentation, write the words to the script first, then locate or create the images to support it. Keep the narration short — between three and 10 seconds for each visual.

The script for a command presentation is similar in appearance to the video news release shown in chapter 14, save the administrative information, four-unit heading, release line and so forth. Use the left column to identify the visuals and the right column for the narration.

Some other points for you to consider regarding command presentations are as follows:

- Keep charts and graphs simple.
- Limit the number of “word” transparencies/slides.

USS GERMANTOWN (LSD-42)

**WELCOME
ABOARD!**

**United
States
Ship**

GERMANTOWN (LSD-42)

Figure 16-7.—Welcome aboard booklet.

- Keep the format and color of title and “word” slides consistent.
- Make sure the type in “word” slides is large enough to be read easily.
- Keep the sentences in the script short and use the active voice.
- Avoid mixing vertical and horizontal slides in the same command presentation.
- Avoid using Navy acronyms.
- Make sure your presentation is between 15 or 20 minutes in length. The longer the presentation, the more you risk losing your audience.

Further information on staging a presentation can be found in chapter 6 of the *JO 1 & C NRTC*.

COMMAND HISTORIES

Command histories provide the **only** overall account of the activities and achievements of U.S. Navy commands. Housed at the Naval Historical Center in Washington, D.C., command histories serve as the eventual basis for published naval histories.

All command histories are indexed and accessible to authorized users (within security limitations). They are used by staff officers who need information on the recent past, as well as by official study groups, authorities responsible for verifying unit combat and overseas awards and service, and often the command itself when a need arises for background information. Furthermore, numerous queries from other government officials, Congress, former Navy members and the public at large are answered using command histories.

Normally the PAO is tasked by the CO or XO to write a complete annual history of the command. However, this assignment may someday be your responsibility, especially if you work for a collateral-duty PAO.

The typical command history is not intended to be a work of literary art, but you must write it in clear and concise English with a minimal amount of technical jargon and acronyms. It should contain a basic historical narrative written in chronological order or broken down by department or subject. It also should include significant statistical data that should be part of the Navy’s permanent records, such as ammunition expenditure, number of underway replenishments,

ships and aircraft overhauled and repaired and other facts important to fulfill the mission.

Follow the narrative with a brief discussion of any special topics that merit further coverage, such as major events, developments and operations; changes in missions and functions since the submission of the last command history; and changes (if any) in homeport, group, squadron or headquarters. Include any appropriate supporting documents, such as change of command booklets, “personal-for” messages and biographies.

Some references you can use to compile the command history include deck and engineering logs and the ship’s diary. You also may ask each department head to submit a monthly input (if not already ordered by the CO or XO). Another method is for you to maintain an annual file and put notices, memos and ideas in it. Use whatever method works for you, but make sure you gather the material you need well in advance to meet the submission deadline. With few exceptions, the Naval Historical Center must receive all command histories by March 1 of the following year.

For more detailed information, refer to *Command Histories*, OPNAVINST 5750.12.

COMMAND AND FLAG OFFICER BIOGRAPHIES

Biographies of command and flag officers (and C/MCs) are an important part of your public affairs office files. You will use them in media kits, welcome aboard booklets, external releases and other media-related products.

The standard biography has 1-inch margins with either blocked or indented paragraphs. There are two spaces between paragraphs.

The first paragraph of a biography mentions where the subject is from and lists educational achievements beyond high school (do not include the birth date). Also mention when officers received commissions and from what source. For enlisteds, mention when he joined the service and where he attended basic training.

Subsequent paragraphs usually outline (in chronological order) the person’s career, listing significant jobs, accomplishments and educational achievements. Devote separate paragraphs to the person’s current assignment and his medals and awards.

The last paragraph should indicate the subject's marital status, spouse's name (including maiden name, if applicable) and place of birth. Names of children are included, and — if there is enough space — where they are attending college and serving in the military.

Some additional points to remember when you write biographies are as follows:

- Keep the civilian reader in mind. For example, Commander, Operational Test and Evaluation Force, Atlantic (COMOPTEVFORLANT) may be the correct way to phrase a military title, but it is much easier to understand if you write it like this: "Rear Adm. Clauster is the commander of the Operational Test and Evaluation Force, Atlantic."
- Pay special attention to capitalization. If you are not saying "Commanding Officer Lemming," then commanding officer is not capitalized. The same rule applies to any other billet titles listed throughout the biography, such as executive officer, training officer and company commander. The rule of thumb for you to follow is this: if the title directly precedes the person's name, you capitalize it. However, if the title stands alone or follows the person's name, you use lowercase. Warfare specialties also are lowercase, as in this example: "He was designated a naval aviator in 1973. ..."
- Lowercase educational degrees. It is a "master's degree in aeronautical engineering." Also, one receives a degree from or earns a degree at a university.
- Lowercase ranks unless you attach a name to them. One is "commissioned an ensign."
- Use the person's present rank when you refer to him throughout the biography.
- Omit street addresses.
- Keep your biographies to one page. If you can reproduce a photograph of the subject on the biography sheet, place it in the top left or right corner of the page and wrap the text around it.
- Note the month and year of the biography in the lower right-hand corner of the page. By doing this, you can distinguish the latest version of the biography from previous ones.

The biography ultimately belongs to the person about whom it is written. He may have personal reasons for including or excluding certain personal

information, so be accommodating. However, you should advise the subject of the style of the biography in a tactful manner.

A sample flag officer biography is shown in figure 16-8.

THE MEDIA

LEARNING OBJECTIVE: *Identify and recall the various types of media and recognize the media relations responsibilities of the public affairs office staff.*

The Navy is a definite source of news. Some of this news will be good and some bad. Good or bad, the rules established for good media relations dictate that all Navy news be treated objectively.

Media will publish or broadcast, and the public will learn about newsworthy events and other information concerning the Navy, whether or not the Navy cooperates. Furthermore, media will decide the interests and newsworthiness of Navy news — not the naval commander or the PAO.

MEDIA TYPES

Before we examine the elements that help create good media relations, it is beneficial for you to examine and understand all available media. In doing so, you must determine the requirements of each medium and then fulfill these requirements, using the guidelines mentioned later in this section.

At a minimum, your public affairs office should serve the following media and be familiar with their requirements:

- Newspaper
- Radio
- Television
- News services
- Syndicates
- Magazines
- News magazines
- Consumer magazines
- Internal or promotional publications
- Books

**ADMIRAL RODENTIA M. "RODDY" NUTRIA IV
UNITED STATES NAVY
COMMANDER NAVAL SUBMARINE FORCES
LAKE PONTCHARTRAIN**

Admiral Rodentia M. "Roddy" Nutria IV, a native of Natchitoches, La., earned his master of science degree in marine electrical engineering at New Iberia University before entering the Navy in 1962 through the NROTC (Naval Reserve Officers Training Corps) program. His first assignment was to the destroyer USS *PRUDHOMME* (DD 949), where he served as electrical officer. Admiral Nutria attended submarine school at New London, Conn., in 1965 and graduated with honors.

He was assigned to USS *JACK CREVALLE* (SSN 440) as "A" division officer and assistant navigator. He returned to submarine school for nuclear training in December 1968 and then served one year at the school as an instructor in the mathematics department. Subsequent tours included USS *HAGFISH* (SSN 441), USS *PLECTOGNATH* (SSBN 111) and USS *CEPHALOPOD* (SSN 443), where he served as executive officer.

From January 1979 to August 1981, he served as the commanding officer of the U.S. Naval Submarine Research Center, Hialeah Gardens, Fla. Following tours included commanding officer, USS *CRAWFISH* (SSN 444); budget officer on the staff of Commander, Submarine Force, U.S. Gulf of Mexico Fleet; and aide to the commander of the Operational Test and Evaluation Force.

Admiral Nutria next commanded Submarine Squadron Nine until reporting as a division director in the Bureau of Naval Personnel in 1989. He was selected for promotion to flag rank in May 1990 and assumed his current duty at that time.

As commander of Naval Submarine Forces, Lake Pontchartrain, Admiral Nutria controls the operations of 59 submarines in the defense of Louisiana's southeastern lake front.

Admiral Nutria's awards and decorations include the Defense Distinguished Service Medal, the Navy Distinguished Service Medal (three awards), Legion of Merit (four awards), Meritorious Service Medal, Navy Commendation Medal with Combat "V" and the Navy Achievement Medal (four awards).

He is married to the former Lulubelle Bogalusa of Marrero, La. They have three children: Lupé, a medical student attending Pacific Western University; Dominica, a Coast Guard lieutenant; and Edwardo, a professional bodysurfer.

Figure 16- 8.—Flag officer bibliography.

Newspaper

The newspaper is the oldest medium of mass communication and it remains the backbone of public information. While the number of newspapers published in America has declined with the ascendancy of television, total circulation is increasing.

There are differences between the metropolitan daily, the suburban or neighborhood daily and the weekly newspaper. Whereas, a metropolitan daily focuses on international, national and top-level local news and features, a suburban daily (or weekly) may limit itself to local and regional news with only brief summaries of national and international news. Suburban newspapers have grown in popularity recently, because of their comprehensive coverage of local news.

Radio

Radio became a medium of mass communication in the 1930s. Its advantages are immediacy, variety, mobility and aural appeal. Because of the recent resurrection of the AM news/talk format, the radio listening audience may include nearly every individual in the country.

Radio is conversational, informal, intimate and timely. It has an almost instantaneous reaction time to fast-breaking news, but it is limited to headlines and high points.

Television

Television is the newest and most potent of mass communications media. It combines the impact of sight and sound with the immediacy of radio. Communication satellites and roving news teams can

relay live telecasts from almost anywhere in the world or even outer space.

Television news programs are network (60 Minutes, 20/20, etc.) or local in origin. Most local stations do live coverage and welcome the opportunity to consider videotapes of significant military news or feature events, including sports.

In many areas, television stations are owned by or closely allied with newspapers. Most use The Associated Press as their primary news service.

News Services

News services, often called wire services, exist to provide the mass media with coverage they cannot afford to get by any other means.

The Associated Press is the primary news service used by American print and electronic media. You should be aware that there are also several foreign wire services, such as Reuters (England), Agence France Press (France) and Xin Hua (Peoples Republic of China).

Syndicates

Syndicates are either owned by a large newspaper or chain of papers, or they are the result of cooperative agreements among noncompeting papers. They often provide in-depth stories of what the wire services report as spot news. Examples are as follows: NANA (North American Newspaper Alliance), NEA (Newspaper Enterprises Association), *New York Times*, *Chicago Tribune*, *Los Angeles Times* and the Hearst Headline Service.

Magazines

Magazines may be grouped as news, consumer or internal/promotional publications. Magazines have wide circulation, though they are published less frequently than newspapers.

Requests for help on Navy features made by a national magazine must be approved by CHINFO before information is released or support is given.

News Magazines

News magazines (*Time*, *Newsweek*, *U.S. News and World Report*) are national weekly publications that cover the major news of the week in greater depth than daily newspapers or the electronic media.

Consumer Magazines

Consumer magazines appeal to various special interests of the public. Technology, business, sports, hobbies, theater, gossip and humor are among the major subjects reported. These provide an opportunity to tell a story in greater detail or from a particular point of view. Stories need not be as timely as in a news magazine.

Internal or Promotional Publications

Internal or promotional publications reach the internal and external audiences of companies, agencies, professions or vocations. They are also called trade journals and house organs. *Public Affairs Communicator* is an example of a trade journal.

Books

Many PAOs are asked to assist authors of books dealing with military subjects. More than 30,000 books are published in this country annually. Because of the continuing importance of the Navy and the armed services as a whole to our society, authors of virtually all classes of books (nonfiction, adult, juvenile, general, text and pictorial) rely on the public affairs office for help in gathering material.

A more in-depth study of the media can be found in the *JO 1& C*.

ESTABLISHING GOOD MEDIA RELATIONS

Four key words should govern your relations with representatives of the mass media. They are as follows: **security, honesty, accuracy and promptness.**

Security

Make sure the information you release to the media does not contain security violations. In addition to getting yourself neck-deep in trouble, you may endanger the welfare of your country. You should adopt this slogan: "When in doubt, check it out."

Honesty

Your good name is your most valuable asset. Justify the media's belief and trust in the Navy by playing the news game honestly. Never fake a story or serve a selfish interest. Do an honest, straightforward job of reporting the news. Credit your source. Never

plagiarize or use copyrighted material without permission.

Accuracy

Every news release or statement released to the media must be 100-percent accurate. Make one blunder and the media will lose confidence in you. Be sure to check and double-check all statements, names, addresses, dates and numbers. Be sure your personal opinions do not interfere with your media relations. Your job is to tell the facts.

Promptness

A good Navy Journalist aims for speed without sacrificing accuracy. Reporters want their material quickly, because competition is keen and the public demands fresh news. As long as you can supply this material the way they want it and in time to meet their deadlines, you can expect cooperation.

MEDIA VISITS

Media representatives visiting your ship or station are considered guests of the CO, even when they are covering an assignment. As guests, they are due the utmost courtesy and respect. As working men and women, they rate your full cooperation and assistance.

If you are assigned to escort a reporter on a tour of the ship or station, plan your route ahead of time. Include as many points of interest as possible within security limits. Be relaxed and natural in your actions. Let the reporter know you know your job, but do not try to talk above your level of expertise. Any experienced reporter can sense a “snow job.”

Reporters may be permitted to travel aboard Navy ships and aircraft to cover news events when this travel is in the interest of the DoD or DoN. However, travel must not place the Navy in a position of competing with established commercial transportation facilities along the same route. Transportation furnished is not considered to be in competition with commercial facilities when the travel is necessary for obtaining news material or when correspondents are invited to report on a matter considered of special interest to the Navy.

While aboard, reporters traveling on Navy ships may transmit their stories using shipboard communications facilities. Specific regulations and

procedures for the handling of press traffic are found in chapter 3 of *PA Regs* and the *Navy Communications Manual*, NTP-9.

For more detailed information regarding media visits, consult chapters 3 and 4 of the JO 1 & C.

EXCLUSIVE STORIES

Exclusive stories are in great demand, especially where competition is strong. It is the policy of Navy public affairs not to release regular news stories on an exclusive basis. A Navy release of general interest usually goes to all outlets on your media mailing list simultaneously.

There are some exceptions to this rule. For instance, if you have an idea for a magazine feature story, it must be written or slanted toward a particular market. Since most magazines demand exclusives, the story would naturally be submitted to one magazine outlet.

Another exception is when a commercial writer develops an idea for an exclusive on his own initiative. When a reporter comes to the PAO with an idea for a story, the writer should be given full cooperation. The idea should be kept in confidence and should not be relayed to other media or made the basis of a Navy release.

If another reporter hits on the same idea, the writer should be told that the first person is already working on that angle. Do not reveal who the other writer is, unless the identity is made obvious by circumstances. If the second person wants to continue on the same idea anyway, the reporter should be given the same cooperation as the first person. However, in a case like this, always tell the first reporter what happened.

The same process should be repeated if a third reporter becomes involved. However, when more than three requests are received for the same information, everybody should be informed that the information cannot be provided on an exclusive basis and the information will be disseminated as a general Navy news release.

MEDIA QUERIES

A media query is a request for information by a reporter, usually made by telephone. This indicates that the reporter needs the information **now** — not tomorrow or next week.

As a rule, you should refer all queries to the PAO if they are other than simple, routine questions. The PAO

has the authority to release information and is more likely to know the representative calling.

When your boss is not available, you should answer the query provided the requested information is either releasable or within the limits of security. In most public affairs offices, a set of ground rules is established to cover situations of this type. The first one is to write down the exact question and the name and organization of the caller. Many PAOs use the query sheet shown in figure 16-9.

If the information is not readily available, explain this to the reporter and promise to call back in 5, 10 or 15 minutes, depending on how long it will take you to get the answer. Never brush a reporter off with a vague promise, such as, "I will see what I can find out." Be courteous — remember you are representing your command and the U.S. Navy.

Once you are off the telephone, start digging up the information. Check the files, consult reference material or contact officers who may answer the question with authority. If you run over the time limit, return the call and explain the delay. Always keep in mind that the reporter is probably working against a rapidly approaching deadline.

MEDIA INFORMATION KIT

The media information kit is one way to provide visiting reporters with valuable background information on your ship or station. A typical media information kit contains the following materials:

- Command history
- Pertinent facts about the population of the command
- Welcome aboard booklet
- Biographies of senior officers
- Photographs
- Any other appropriate information that will supplement the subject on which they intend to write

Media information kits can serve many other useful purposes. For example, you may give them to visiting dignitaries or guest observers on fleet exercises and operations. They are used during command public visitations, commissioning ceremonies and other special occasions. Aboard ship they are forwarded with advance news releases to local editors in ports scheduled to be visited. American

officials in foreign countries also need kits for publicity purposes when ships visit them.

Use standard-size double-pocket folders to assemble your media information kits. You can arrange material in several different ways, but we recommend placing the command history, photographs and biographies on the left side, and other amplifying information on the right side.

You should review information kits regularly, because the material in them becomes outdated.

TOURS

LEARNING OBJECTIVE: *Identify the purpose of tours and the characteristics and skills required of the one conducting a tour.*

An important part of your community relations efforts center around public tours of the command. Regardless of its size, your command will generate a great amount of community interest. Therefore, the public affairs office staff conducts tours so visitors can witness the Navy in action first hand. Tours also carry great recruiting potential.

In general, Navy commands honor requests for tours throughout the year, with certain days set aside for general public visitation, such as Navy Day and Armed Forces Day. (Note the use of the term *general public visitation*. **Never** use "open house" when referring to public tours of your command because it implies unlimited public access.)

Additionally, you will receive tour requests from a wide variety of groups, including (but not limited to) the Boy and Girl Scouts, NJROTC units, veterans' alumni organizations, junior high/high school classes and other community groups. Sandwiched between these groups are the occasional VIP and celebrity tours.

The availability of your command to provide public tours is driven primarily by the following three factors:

- The security conditions in force
- The personnel available to conduct the tours
- The operational commitments of the command

Now take a look at some of the areas you must become familiar with before you conduct a tour. They are as follows:

- Appearance

Figure 16-9.—Query sheet.

- Command knowledge
- Demeanor
- Patience
- Voice projection
- Emergency procedures

APPEARANCE

As you learned in chapter 1, your appearance must be impeccable. Remember, you represent not only the command but the U.S. Navy. Begin evaluating your appearance by first examining your haircut, and working your way down to the edge dressing on your shoes. Replace old, worn-out ribbons and name tags. Prepare for a tour with the same intensity as if you were preparing for a major command personnel inspection.

COMMAND KNOWLEDGE

You cannot give a good tour if you do not have a wealth of command knowledge. For instance, say you are conducting a tour of your aircraft carrier for a local community group while in port. A member of the group asks you to describe the different types of aircraft that operate from the deck of the carrier. After a long pause, you say, “Well, that information is in your welcome aboard booklet — let me see if I can dig it out for you.”

Obviously, this is the response of a lazy tour guide. Your credibility, and that of the command, is at stake during every tour. If you cannot answer simple questions without referring to a “safety net,” your tour group will be disenchanted. Before the tour, you should know the mission and history of the command, its hardware, important statistics and so on. You can do this by giving yourself a mock tour and asking yourself probable questions the day before. Carry a copy of the welcome aboard booklet and refer to it if you run into any rough areas.

DEMEANOR

It is easy to describe the demeanor you must have when you conduct a tour: **act like a public affairs professional!** Be enthusiastic during a tour, but do not become a social gadfly. You are giving a tour to explain the mission and history of your command, not to make lifelong friends or win a popularity contest.

PATIENCE

Another factor that teams with enthusiasm is patience. Patience comes into play when you try to keep a large tour group on the tour route. You cannot treat the group like a herd of cattle; instead, your

instructions must be conveyed in an appropriate tone and accentuated with plenty of “pleases” and “thank-yous.”

Patience also is evident when you are asked a “dumb” question. We all know there is no such thing as a dumb question, but on occasion a tour participant will ask you a question you think is absurd. For example, it is not uncommon for a civilian to inquire about your ribbons and medals or your rating insignia. Sure, you and the 3,500 crew members on your ship know that a crossed quill and scroll represents the journalist rating — but that does not mean Mrs. Earwig, a 45-year-old high school science teacher from Billings, Mont., knows what it is. In this instance, briefly explain the Navy’s occupational fields and rating system with tact and compassion. If you experience an onslaught of similar questions during the tour, handle each one in the same manner, but **never** vent your frustrations in public.

VOICE PROJECTION

A tour guide who cannot be heard is of no use to a tour group. Make sure you project your voice with authority, especially at airports or around noisy equipment in the hangar bays. If there is enough money in your public affairs office budget, purchase a megaphone or some other type of portable voice amplification equipment.

While projecting your voice, you should speak slowly and clearly so as to increase your chances of being understood.

EMERGENCY PROCEDURES

One of your tour participants collapses while you are explaining the functions of the catapults on the flight deck. What happens to the rest of the group while you attend to the ailing person? Who should you call? Where is the nearest telephone?

Answers to these questions are available in the command or public affairs instruction that covers the policies and procedures for public tours. Within this instruction is a section pertaining to emergencies that occur on the tour route. You should become familiar with the entire instruction, but pay particular attention to the section dealing with contingency responses.

If for some reason this instruction is not available at your command, seek the guidance of the senior journalist or the PAO. You will find more detailed information on tours in chapter 4 of *PA Regs* and in chapter 1 of the *JO I & C NRTC*.

CHAPTER 17

FLEET HOME TOWN NEWS

Most of this NRTC covers your responsibilities associated with keeping the public informed about its Navy. This chapter progresses along the same lines but focuses on the methods you use to gather and release hometown news about the men and women of the U.S. Navy.

Navy people, not unlike their civilian counterparts, have a desire to be appreciated—to have their achievements and contributions noticed and praised. The Navy's Fleet Home Town News Program provides the most effective and economical means for you to release information about individual sea service members to their hometown news media (fig. 17-1). Your participation in the program also produces the following ancillary benefits:

- Improved command retention
- Improved recruiting Navywide
- Increased command readiness through the recognition of its people
- Increased public awareness of the sea services through news stories about the services' education, training and operational missions
- Increased individual and unit morale

The Fleet Home Town News Program is administered by the Fleet Home Town News Center (FHTNC). Further information about the FHTNC and the Fleet Home Town News Program is provided in the following text.

THE FLEET HOME TOWN NEWS CENTER

LEARNING OBJECTIVE: *Identify the responsibilities of the Fleet Home Town News Center (FHTNC).*

Since 1945, the responsibility for processing and distributing hometown news releases has rested with the FHTNC. Located at Naval Station Norfolk, Virginia, the Center is a field activity of CHINFO. In effect, it acts as a clearinghouse for the sea services by editing, reproducing and mailing hometowners to the media in communities throughout the United States,

Service Notes

Kyle M. Parker
Navy Seaman Recruit Kyle M. Parker, son of Marine Corps Capt. James M. Cain of Twentynine

McCoy finishes Navy Hospital Corps School

Navy Hospitalization Recruit Le Talia A. McCoy, daughter of Lottie J. McCoy of 523 Sixth St. in Tallulah, recently graduated from the Navy's Hospital Corps School.

During the course at the Naval School of Health Sciences, San Diego, students receive instruction on basic medical procedures used by hospital corpsmen who assist Navy doctors and nurses.

Course studies also include an introduction to all phases of military health service, x-ray technology, laboratory analysis, general practice and surgery.

The 1991 graduate of McCall Senior High School joined the Navy in January 1992.

Palms, recently completed basic training at Recruit Training Command, Great Lakes, Ill.

During the cycle, recruits are taught general military subjects designed to prepare them for further academic and on-the-job training in one of the Navy's 85 occupational fields.

Studies include seamanship, close-order drill, naval history and first aid.

Parker is a 1992 graduate of Twentynine Palms High School.

DANIEL S. GAMMON

Seaman Daniel S. Gammon, son of Air Force Master Sgt. Danny L. Gammon and Janet L. Gammon of San Antonio, Texas, and a grandson of Mr. and Mrs. C.A. Gammon and Mrs. Velma Trosper, all of Bowling Green, was promoted to pay grade E-3 Aug. 1 at Naval Air Station, North Island, Calif. He is stationed aboard the USS Ranger which has been deployed to the Persian Gulf.

He is a 1989 graduate of Lackland High School in San Antonio.

Clifton Barber returns from deployment

Navy Fireman Clifton O. Barber, son of Richmond and Gertrude Barber of Tallulah, recently returned aboard the guided missile cruiser USS England from a six-month deployment to the Western Pacific.

During the deployment, USS England traveled over 33,000 nautical miles and participated in several exercises with the Australian Navy and Japanese Maritime forces plus other U.S. Navy and Marine Corps units. USS England was part of the last Navy battle group to visit Naval Base Subic Bay, Republic of the Philippines, scheduled to close later this year.

USS England sailors provided humanitarian assistance to a local Olongapo City, Republic of the Philippines, elementary school by painting and making numerous repairs to the aging building as well as purchasing recreation equipment during a port visit to Naval Base Subic Bay.

Assisted by the sailors on USS Anietam, the England also hosted a Texas style barbeque for the residents and staff of a local Pattaya Beach, Thailand, boys' home. The language barrier was broken by the smiles of all involved. Barber visited ports in Australia, Brunei, Hawaii, Hong Kong, Japan, Thailand, Singapore and the Republic of the Philippines.

The 1983 graduate of McCall Senior High School and 1989 graduate of Louisiana Tech University in Ruston, joined the Navy in January 1990.

Figure 17-1.—Fleet Home Town News Program news clippings.

American Samoa, Puerto Rico, Guam and the U.S. Virgin Islands. (In 1992, the Center stopped sending releases to the Republic of the Philippines upon the departure of U.S. forces.)

Through a mutual agreement with the Commandants of the Marine Corps and Coast Guard, the instructions and policies of the FHTNC apply to all Marine Corps and Coast Guard commands, organizations and activities participating in the Fleet Home Town News Program.

You should keep in mind that the Fleet Home Town News Program is not optional for your command—it is required by *Instructions and Policy Concerning Fleet Home Town News Program*, SECNAVINST 5724.3. Make sure you examine this instruction in its entirety.

CLIENTS

Hometown media are the “clients” of the FHTNC, including newspapers, radio and television stations and special interest publications. They neither pay for stories, nor are they obligated to use the material. However, since they must request the material to receive it, most of the clients do use it.

NOTE: You may not mail hometown news material directly to the media, unless interested media have specifically requested it. SECNAVINST 5724.3 emphasizes that all hometown news, other than specifically authorized exceptions, must be forwarded via the FHTNC.

The authorized exceptions are as follows:

- Material prepared by recruit training commands concerning special recruit units may be forwarded directly to the activity for placement in local media, when requested by the recruiting activity that enlisted the unit.

- Hometown news material concerning a member of a command whose hometown is in the immediate geographic area (generally within 50 miles) of the command may be placed directly with local media. This provision also may include media in communities where the command maintains direct contact, such as USS *Los Angeles* (SSN 688), with Los Angeles, California. In the case of a namesake ship program, commands should receive guidance from the appropriate PA Center or NAVINFO Office.

Hometown news feature material may be provided directly to any news media making requests for information on specific individuals, subject to the instructions of appropriate operational or other higher echelon commanders governing media relations. Normally, such requests will be coordinated with the appropriate service headquarters, PA Center or NAVINFO before release.

SURVEYS

It is the policy of the FHTNC not to send unsolicited releases to the media. Therefore, the Center periodically surveys all potential media clients in the United States and its territories. Those news media editors who want to receive hometown news releases must indicate this on the FHTNC survey form.

A recent media survey revealed the following statistics:

- 96 percent always or sometimes use award releases; 84 percent always use them.
- 96 percent always or sometimes use promotion releases; 77 percent always use them.
- 93 percent always or sometimes use school graduation releases; 78 percent always use them.
- 72 percent get feedback from their readers/audience about releases; 98 percent describe the feedback as positive.

STORY CATEGORIES

LEARNING OBJECTIVE: *Identify the most common hometown news story categories and the appropriate and inappropriate hometown ties.*

Hometown news stories usually fall into one of three categories—military achievement, personal achievement or participation stories. These categories are explained in the following text.

MILITARY ACHIEVEMENT

Military achievements are those personal newsworthy accomplishments that are job related. Consider the following examples:

- School graduation (**NOTE:** To avoid embarrassment in case of early dismissal, the FHTNC does not process stories about individuals reporting to schools. Additionally, this category applies only to formal training four weeks in length or longer, such as “A” and “C” schools.)
- Personal award (**NOTE:** Since some recommended award recommendations are downgraded before being presented, **DO NOT** submit *recommended* awards. Submit only awards that have already been presented.)
- Advancement or promotion (**NOTE:** Keep in mind that an individual who is “frocked” to a specific paygrade is **NOT** officially advanced to that paygrade until a later date. Therefore, submit advancement/promotion stories *only* when individuals are officially advanced.)
- Qualification (JOOD, OOD, EAWS, ESWS, etc.)

- Honors earned in school or in training
- Reenlistment
- Lifesaving effort or rescue
- Retirement

PERSONAL ACHIEVEMENT

Personal achievements are those personal newsworthy accomplishments realized during off-duty hours. Consider the following examples:

- College degree or high school diploma earned
- Award received from the Navy League of the United States or other civic organization, but not commercial firms

PARTICIPATION STORIES

Participation stories result from an individual's being a part of his command's activities. Consider the following examples:

- Reporting aboard
- Deployment or a change in the location of the unit
- Port visit
- Participation in an exercise or operation
- Participation in evacuation operations
- Active duty for training (ACDUTRA)

NOTE: The FHTNC does not process feature stories.

APPROPRIATE HOMETOWN TIES

For purposes of this section, the term *hometown* refers to the place of residence of the sea service member's immediate next of kin, a spouse's immediate next of kin, and when appropriate, college alumni publication. Other suitable hometown ties include another blood relative, or an in-law or legal guardian living in a community in the United States or its possessions.

INAPPROPRIATE HOMETOWN TIES

You must not use spouses, dependent children or friends as hometown ties. This will eliminate the possibility of harassment if official duties require the

servicemember to be away from his residence on a regular basis.

PROMOTING THE FLEET HOME TOWN NEWS PROGRAM

LEARNING OBJECTIVE: *Identify the methods used to promote the Fleet Home Town News Program.*

Participation in the Fleet Home Town News Program by individual service members is strictly voluntary. Nonetheless, you should present the program in a positive manner to encourage involvement. While some people may not be interested in the "publicity," their relatives and friends back home probably are interested.

Soft sell the program, but **do** attempt to sell it. If an individual still chooses not to participate, honor the person's decision and do not forward the release form to the FHTNC.

You can sell the program in the following ways:

- Run Plan of the Day/Week notes.
- Make SITE-TV spot announcements.
- Make promotional spot announcements on ship's radio.
- Ask the CO, XO or C/MC to make promotional announcements during Captain's Call.
- Promote the program during command indoctrination classes ("I" Division).

PROCESSING FHTNC MATERIALS

LEARNING OBJECTIVE: *Recognize the correct method of processing FHTNC materials.*

The success of the Fleet Home Town News Program depends on your continuous, active support. Therefore, you should give the people at your command ample opportunities to participate in the program and you should encourage future involvement. A good starting point for you to solicit participation is when military members first report to your command; so make sure the public affairs office is on the command's check-in sheet.

FLEET HOME TOWN NEWS RELEASE FORM

At first glance, conducting a hometown news program appears to be a monumental task. However, closer observation reveals it is a relatively simple process in terms of meeting public affairs objectives. The FHTNC has simplified the procedures for submitting hometown news material by designing a standard release form, the Fleet Home Town News Release Form, NAVSO 5724/1 (Rev. 1-95). You should use this release form for all hometown news releases.

NOTE: Contact the Center or check SECNAVINST 5724.3 for the most current release form revision date.

When properly completed (mostly by the individual about whom the release is being made), the release form contains all the information necessary for writers at the FHTNC to prepare the hometown. Figure 17-2 and 17-3 are examples of a NAVSO 5724/1; this form was revised in 1995. The reverse side of the release form (fig. 17-3) carries block-by-block instructions. This new form also includes a third (blank) page for specific information such as news releases, roster stories, etc. For this reason, we will not provide a block-by-block breakdown of the release form.

The NAVSO 5724/1 was designed to give uniformity to the Fleet Home Town News Program and to accelerate the processing of hometown news releases. They are available through the Navy supply system, so maintaining an adequate number of them should be easy. However, if you run out of release forms, you may use locally produced copies until your stock is replenished. The information may be typed or printed.

NOTE: The FHTNC should receive completed release forms no later than 30 days after the event occurs (allowances are made for submarines). After the release forms are processed and the subsequent news releases are mailed, the forms are maintained for 90 days in an alibi file and then destroyed.

On occasion, a few release forms do not get processed and are returned to the activities that submitted them. Along with the returned release forms is a short explanation listing the reason(s) they were not accepted. There are several reasons a particular release form may not be processed. It could be that there are no media in a particular community or area that desires the stories. The release form might be

received without the required signatures, or there might not be enough information with the release form to develop a meaningful release.

You can reduce the number of nonreleased forms by following all of the directions on the back of the NAVSO 5724/1. Check all blocks on the front of the release form for completeness, accuracy and legibility **before** the release form is mailed to the FHTNC. Currently, forms are not accepted by electronic mail.

The Fleet Home Town News Center will annually review your command's FHTN program by Unit Identification Number (UIC) and provide written feedback on how well you are using the program to benefit your command.

Log Book/Index File

You should maintain a 90-day log book or index file of each release form mailed to the FHTNC. The record should include the following information:

- Name and social security number of the individual
- News event
- Date mailed

By tracking your release forms in this manner, you can work with the Center in purging release forms that belong to an injured or deceased crewmember. It is embarrassing when a release is made on an individual's participation in an exercise when he was discharged months earlier. More important, the release of a story about an individual who "recently visited Sasebo, Japan," when in fact he was hospitalized or deceased, will cause confusion and additional grief to family members.

The FHTNC is an addressee on all death or serious injury messages. Upon receiving a casualty message, the Center immediately inputs the social security number of the casualty into the computer system. The computer indicates whether a news release is currently being processed or has been mailed out on that individual, as well as the names of the hometown media that received it. If the release has left the Center, the appropriate media outlets are called immediately and requested not to run the story.

Command Releasing Authority

Each submission to the FHTNC must be authorized for release and verified for accuracy by the submitting command. The command's "releasing

INSTRUCTIONS	FHTNC USE ONLY																																																																														
<p><i>The Fleet Home Town News Center can help your family, neighbors, and friends back home recognize your achievements. Fill out this form so FHTNC can send news releases about your accomplishments to participating hometown newspapers, college alumni publications, radio and TV stations.</i></p> <ol style="list-style-type: none"> 1. Print or type your complete name (first, MI, and last). Your social security number and signature is required. Please date the form when you sign. 2. Indicate your rank (i.e., YN3, CPL, LT). 3. Indicate the month and year you reported to your current command. 4. Indicate your projected rotation date. 5. Indicate your complete command mailing address. Include FPO address as appropriate. If this form needs to be returned to your command, this block will be the mailing label. Check with your supervisor if you don't know your command's address. 6. This block is to be completed by your unit public affairs officer or unit information officer. Include the command's homeport and a complete duty phone number where we might be able to contact you if necessary. If your unit is forward deployed, deployed, or commencing deployment, then your releases will be designated as a "Hold File," therefore, indicate "yes" beside "Hold File". If your unit is embarked, indicate what platform (i.e., HSL-41 Det B, embarked aboard USS Deyo; VF-143 embarked aboard USS George Washington). 7. Indicate your unit code as appropriate. (UIC for Navy, RUC-MCC for USMC, and OPFAC for USCG units.) 8. Check your branch of service. 9. Check for active duty status or reserve duty status. 10. Indicate the month and year you entered active duty. 11. Check appropriately. 12. Check current marital status. 13. If you are currently married, include spouse's first name and complete blocks 20 and 21 with in-law's names and addresses. 14. - 15. If you graduated from a college or university, please indicate the name of the college or university you graduated from; the type of degree received, such as BA or MA, and the year in which you graduated. If you have an additional degree or graduate degree, complete block 15 also. 16. Briefly describe your job (i.e., command master chief; ship's navigator; or platoon sergeant). 17. Indicate the date of event and then check the appropriate box. If you check the "promoted" box, the story will indicate you have been promoted to the rank in block 2. If you check "MEDAL/AWARD", please include a copy of the citation (not required for Good Conduct Medals). If "retired" or "reenlisted", state number of years. 18. - 21. List names and addresses of living parents, grandparents, in-laws or other relatives in appropriate boxes. If you are listing relative other than in-laws, in blocks 20 and 21; write the relationship in the appropriate box (i.e., grandmother, brother, uncle, foster- or step-parent). Please include full street address, city, state, and ZIP Code. (ZIP Codes are necessary for release to hometown media). If the address in block 19 is the same as block 18, mark the box in the address line in box 19. The same applies to boxes 20 and 21. 22. Indicate the name of the high school you graduated from, the year you graduated, and the city, state, and Zip Code where the high school is located. 23. - 25. FOR RESERVISTS USE ONLY. If you are a reservist please indicate your home address, city, state, and Zip Code in block 23. In block 24 indicate the name and address of your employer. In block 25 indicate your position or job title within the company, and the number of years you have been employed there. Indicate the city, state, and Zip Code of your employer. 	<p>Numbers below correspond with the number of blocks on this form. If a box is marked below, something is wrong with the corresponding block on the form. Please verify the information, make necessary changes, and return to FHTNC for processing. authority” may be whomever the commander has designated to conduct the fleet hometown news program within his unit (usually the PAO, but it can be also a JO). The command releasing authority prints and signs his name in block six of the release form and indicates his duty telephone number.

Social Security Number

Make sure the servicemember understands that the social security number listed in block 1 will not appear on the actual news release. It is required solely to track casualties.

PHOTOGRAPHS

Good photographs enhance the potential use of hometown news releases. Either formal or informal, portraits are useful hometown news photographs. These photographs range from the basic head and shoulders picture (mug shot) to a shot of the individual in a working environment. The individual’s face should be clearly identifiable in the photograph.

The FHTNC prefers at least five black-and-white wallet-sized prints for each submission. The wallet-sized prints will fit easily in standard business-sized envelopes. However, if you must mail larger prints, the FHTNC will accommodate you.

Digital images saved to disk are acceptable as supplemental information, but photographs are preferred. The Center will scan photos and make them available in digital image format for media outlets that request them. Do not send photo negatives to the FHTNC, as it does not have the capability to work with them.

Most of the print media editors on-line at the FHTNC enthusiastically request more photographs. The Center sends out **all** photographs it receives, informal or formal, as long as amplifying information (identification of people, description of the event taking place, etc.) is included on the back of each photograph. Type this information on a separate piece of paper or on a label and attach it to the photograph. Your doing this prevents “bleed-through,” a common occurrence when you write on the back of a photograph with a ballpoint pen. Put the photograph in an envelope and attach it to the completed NAVSO 5724/1.

LETTER OF TRANSMITTAL

If you send nine or fewer release forms to the FHTNC at one time, the command releasing authority must complete block two of the release form. However, if a single mailing consists of 10 or more release forms, you must include a cover document called a letter of transmittal (fig. 17-4).

A letter of transmittal serves several purposes. It makes the transaction official and gives the FHTNC authority to process the story. In addition, it aids the Center in processing the material faster by indicating the type of material submitted, the general subject matter and the number of stories involved.

The CO or an officially designated representative (such as the PAO) should sign letters of transmittal. Send only the original of the letter to the FHTNC.

HOLD FILE

LEARNING OBJECTIVE: *Interpret the policies regarding the submission of a hold file to the FHTNC.*

A hold file is a roster package of NAVSO 5724/1 release forms submitted by a unit when it deploys. The hold file provides a rapid means of generating timely and newsworthy releases about the accomplishments, achievements and travels of your crew, either individually or as a group.

Hold files are maintained by the FHTNC for the length of the deployment and are normally returned to the command once the deployment is completed. If your unit is not deployed, you should maintain an updated roster package in your office anyway. In the event that your unit must deploy on short notice, you can submit a hold file with little effort.

Any unit departing on an extended deployment (usually two months or longer) should forward a hold file to the Center. If your unit will be involved in exercises or special operations of shorter duration, seek the guidance of the FHTNC.

MAILING THE HOLD FILE

You should update and verify all the release forms in your hold file 30 days before your unit deploys. Mail the hold file to the FHTNC when you are 20 days from the deployment date. Make sure it is in alphabetical order by last name and accompanied by a letter of

Figure 17-4.—Letter of transmittal.

transmittal. We recommend including the deployment information or story in the letter of transmittal.

NOTE: When you submit stories for release, the Center does not require strict adherence to journalistic style. Since the FHTNC is ultimately responsible for editorial action, all you need to include is a brief synopsis of the facts that answer the five Ws.

Before the hold file is sealed and on its way to the FHTNC, you should make a copy of each release form and store each one of them in an appropriately marked office file. Your hold file should be an exact duplicate of the one received by the Center. This is extremely critical, especially when you must change data or pull a release form in the event of a death or injury.

PROCESSING THE DEPLOYMENT STORY

When a unit deploys, the PAO or his representative normally sends a message to the FHTNC that contains the following information:

- The authority for the FHTNC to process the deployment story.

- The date the story should be processed (usually without delay).
- Verification that the hold file is accurate and up-to-date.

Once the message is sent, the Center can work on writing the deployment story, which will result in a release for all of the release forms in the hold file.

An example of a hold file message to the FHTNC is shown in figure 17-5.

SENDING STORIES BY MESSAGE

Once the hold file is at the Center, you may send several different types of stories by naval message. The mid-deployment story (fig. 17-6) and end-of-deployment story (fig. 17-7) are good ways to get multiple releases for each release form submitted.

Further, you should pursue the types of stories mentioned earlier — those dealing with the military or personal achievements of individuals. Doing this in connection with your hold file is easy. For instance, say

BT

Figure 17-5. Hold file message.

Lt. Cmdr. Nunez is awarded the Meritorious Service Medal. When you advise the Center of the award (and include amplifying information from the medal citation), Lt. Cmdr. Nunez's release form will be pulled from the hold file and the story will be processed. The release form will then be returned to the file.

UPDATING THE HOLD FILE

Hold files have a 60-day life cycle. When you send a hold file to the FHTNC, the cycle begins on the day the Center receives it.

At day 50, your unit will be sent a message advising that the file will be returned in 10 days unless it is updated. Each time you update your hold file, another 60-day cycle begins.

The FHTNC considers an update as any communication regarding the hold file. It may be a list of names to be deleted, a list of release forms for

persons who have reported to the command or simply a declaration that the hold file is current and accurate. A hold file update message is shown in figure 17-8.

HOLD FILE DISPOSITION

After the end-of-deployment story is processed, the FHTNC retains the hold file for 30 days in an alibi file before it is returned to the originating command. You also may request that the Center destroy the hold file.

RUN AND RETURN STORIES

Consider the following scenario: Yesterday, 25 members of your command received awards for their participation in the base "Adopt-A-School" Program. A check of your files reveals that all of the awardees have release forms on file in your office. Your unit is not deployed and it is not scheduled to deploy for about a year. How should you submit the release forms

Figure 17-6. Mid-deployment story.

without breaking the integrity of your “inactive” hold file?

The answer is simple — at the top of each release form, mark “**RUN AND RETURN**” before you mail them to the FHTNC. After processing the release forms and holding them for 30 days, the Center will return them to you so you may keep your hold file intact.

NOTE: Make sure the information on “run and return” stories is current before they are mailed to the FHTNC.

HINTS AND REMINDERS

LEARNING OBJECTIVE: *List the hints and reminders used in connection with processing hometown news stories.*

The following hints and reminders are offered as a checklist to help you get the most out of the Fleet Home Town News Program:

- Use only the latest edition of the Fleet Home Town News Release Form (NAVSO 5724/1) (see SECNAVINST 5324.1).

FM USS MOLLUSK

TO FHTNC NORFOLK VA

UNCLAS //NO5720//

SUBJ: END OF DEPLOYMENT STORY

A. MY HOLD FILE (HF)

B. MY 010101Z DEC 94

C. MY 010202Z JAN 95

1. RETURNED TO NORFOLK AFTER A SIX-MONTH DEPLOYMENT TO THE MEDITERRANEAN SEA AS PART OF THE TEN-SHIP USS LIMPET AIRCRAFT CARRIER BATTLE GROUP. DURING THE DEPLOYMENT, THE SHIP STEAMED 15,000 MILES AND EARNED ITS SECOND CONSECUTIVE BATTLE EFFICIENCY "E" AWARD. THIS DEPLOYMENT MARKED THE SEVENTH TIME USS MOLLUSK DEPLOYED TO THE MEDITERRANEAN SEA.

2. HOLD FILE VERIFIED ACCURATE EXCEPT DELETE ENS CARABOK, A. K.

3. REQ END OF DEPLOYMENT STORY FOR REF A. REFS B AND C PROVIDE ADDITIONAL DETAILS ABOUT THE DEPLOYMENT.

4. REQ RETURN REF A AFTER PROCESSING.

BT

Figure 17-7.—End-of-deployment story.

- Follow the block-by-block instructions on the back of the NAVSO 5724/1.
- Make sure the person to whom the release pertains fills in his social security number in block 1 of the release form.
- Make sure the person to whom the release pertains reads and understands the Privacy Act statement on page 1.
- Submit release forms on individuals with hometown ties **only** in the United States, American Samoa, Guam and the U.S. Virgin Islands.
- Screen the release forms for legibility, accuracy and completeness before submission.
- Keep file copies of the messages or letters you send to the FHTNC to use as a ready reference.
- Make sure the letter of transmittal or block six (command releasing authority) of the release form is signed before mailing.
- Submit only current news items.
- Check your hold file frequently. Make sure you update your release forms when people are promoted, qualify or reenlist.
- Do not submit release forms marked "Do Not Release."
- Do not request the stories be sent to specific media.

Norfolk, VA 23511-2125

APPENDIX 1

GLOSSARY

ACTION—In still photography, movement within a scene being photographed.

ADVANCE STORY—A story written to promote scheduled special event.

AFRTS—American Forces Radio and Television Service. Provides its outlets (including NBS detachments) with broadcasting materials.

AFRTS-BC—American Forces Radio and Television Service Broadcast Center. Provides radio and television program materials through the AFRTS Satellite Network (SATNET), on the Armed Forces Satellite-Transmitted Radio Service (AFSTRS) and AFRTS-BC Affiliate Information Network(AIN) teletype service.

AGIATION—The process of moving a photographic film, plate or paper in a processing bath or moving the bath relative to the photographic material during processing.

AMPLITUDE—The range or strength of an electrical signal.

APERTURE—In an optical system, an opening through which light can pass.

ART—A general term for all newspaper and magazine illustrations, including the flag.

ASPECT RATIO—In television, the proportional relationship of the width of the screen to the height of the screen. The aspect ratio of any television screen, regardless of its physical size, is 3:4—three units high and four units wide.

ASSEMBLE EDITING—In television, an editing mode where the editing control unit (ECU) adds control track and program footage (both audio tracks and the video track) to the edit/record videocassette recorder (VCR) at a predetermined in-edited point.

ATTRIBUTION—The act of referring to the name of a person in a news story who makes a statement that may be challenged.

AUDIO CONSOLE—In radio and television, the main board to which microphones, cartridge machines, reel-to-reel tape recorders/reproducers,

remote lines, CD players and other audio equipment are connected.

AUDITION—In radio, the nonprogram channel on an audio console.

BACKGROUND BRIEFING—A briefing usually delivered by the PAO to give reporters background information about a particular subject. The content or source of a story written from a background briefing is usually attributed to a “Navy spokesperson,” “informed military sources” or some other truthful, but not specifically identified, individual imparting the information.

BACKLIGHTING—In still photography and television, the type of lighting effect created when the light source is in front of the photographer and behind the subject. Backlighting is used to separate the subject from the background by casting a rim of light across the head and shoulders of the subject.

BALANCE—(1) In still photography, the process of placing elements of balance, such as objects, shapes or tones, in opposing sections of a photographic composition so that each section appears to have an equal amount of weight or value. (2) In radio and television, the process of adjusting the levels of two or more sound sources in a program so each is heard at the proper comparative volume.

BARN DOORS—In television and still photography, metal flaps connected to the body of a lighting instrument used to control light dispersion.

BIOGRAPHY—A sketch of a person’s naval career, normally written for command and flag officers (and C/MCs).

BLUELINE—A replica of a newspaper in reverse; compatible to a blueprint.

BLUEPRINT—The layout sheets of a newspaper on which a detailed plan or sketch shows the arrangement of art, heads and copy. The blueprint guides the compositor in making up the actual pages.

BODY—The main part of a story that supports the lead and the bridge (if applicable) by telling the full story in detail.

BORDER—An ornamental or finishing rule used around the edge of printed matter.

BORDER AREA—In television, the portion of a graphic that helps prevent damage, eases handling, compensates for improperly framed shots and serves as a bleed-off area for over scanned television sets.

BOX—An enclosure of rules or border used around a headline or story to give a more prominent display.

BRIDGE—In news writing, a connecting sentence or paragraph between the lead and the body of a story.

CABLE RELEASE—A device consisting of a stiff wire encased in an outer flexible covering designed to trip a camera shutter without touching the camera itself. One end is threaded to fit the shutter, and the other has a thumb-operated plunger.

CAMCORDER—An electronic news gathering (ENG) camera that combines a camera, videocassette recorder and microphone in one unit.

CAMEL HAIR BRUSH—A term used to define any brush with superfine, soil bristles used for dusting lenses and front surface mirrors.

CAMERA—A light tight chamber, usually fitted with a lens, through which the image of an object is recorded on a light-sensitive material.

CAMERA, CONVERTIBLE—An electronic newsgathering (ENG) camera that maybe converted for use in a television studio.

CAMERA, ENG—A television camera powered by batteries and used for electronic news gathering (ENG) news assignments.

CAMERA, STUDIO—A television camera mounted on a pedestal that allows the camera operator to wheel it to different locations easily during shot changes.

CAMERA OPERATOR—In television, a member of the studio production team who operates the studio camera according to the instructions of the director.

CAPTION—A small headline or display line sometimes used with a cutline. (**NOTE:** The word

caption also is used as a synonym for the word *cutline*.)

CARD, CHROMA KEY—In television, a visual created when the image from one video source is inserted into the picture of another video source.

CARD, PLAIN TITLE—In television, a visual consisting of printed lettering (without any pictorial background), such as the title of the show and the name of the performers and producer.

CARD, SUPER/KEY—In television, a visual created when the lettering of a card is superimposed electronically over another background (or over another picture) from another camera.

CARET—A character (^) used to denote where corrections are to be inserted in copy.

CART—*See* CARTRIDGE.

CARTRIDGE—A continuous loop of tape encased in plastic and used to play music and sound effects. It is played in a cartridge machine and recues itself automatically after each use. Commonly referred to as a “cart” in the broadcast industry.

CCU—Camera Control Unit. In television, a device consisting of a waveform monitor, television monitor and shading control used by technicians to monitor and adjust the video levels of a studio camera. The CCU is normally located in the television control room.

CD—*See* COMPACT DISC.

CHANGE TRANSMITTAL—The medium used to transmit changes to an instruction, and under special circumstances, a notice.

CHARACTER GENERATOR—In television, a computer graphics system used to create letters and numbers in a variety of sizes and fonts.

CHINFO—Chief of Information. Normally a rear admiral who is responsible for the development of Navy public affairs guidance.

CHROMA KEY—In television, an electronic special effect that combines two video sources into a composite picture, creating the illusion that the two sources are physically together.

CIRCUIT—In radio and television, a group of Navy Broadcasting Service (NBS) detachments or Shipboard Information, Training and Entertainment (SITE) equipped ships that receive the same weekly package of program material

units on a sequential basis from the American Forces Radio and Television Service Broadcast Center (AFRTS-BC). All circuits within a specific geographical area are overseen by a circuit manager.

CLOSE-UP (CU)—In television and still photography, a shot in which the talent or subject is of primary interest and only a small segment of the background is discernible.

COLOR BARS—In television, a color standard used to test and align color television equipment.

COLOR TEMPERATURE—The apparent color of a light source in terms of its relative blue or red content. Color temperature is measured in degrees Kelvin (K).

COLORS, PRIMARY—In still photography and television, blue, green and red.

COLORS, SECONDARY—In still photography and television, cyan, yellow and magenta.

COLUMN INCH—An area that's one column wide and one inch deep and is used in measuring the contents of a newspaper page.

COLUMN RULE—A thin, vertical line used to separate columns of type and to separate unrelated items, such as photographs and stories, from the rest of the page.

COMMAND HISTORY—(1) The only overall account of the activities and achievements of a U.S. Navy command. Annual command histories are housed at the Naval Historical Center in Washington, D.C., and serve as the eventual basis for published naval histories. (2) The portion of a welcome aboard booklet or media information kit that briefly summarizes the history of a command.

COMMAND PRESENTATION—A visual presentation that covers the mission and history of a command. It is usually narrated live from a script and accompanied by either overhead transparencies or 35mm slides. The command presentation also may be recorded on videotape.

COMMAND RELEASING AUTHORITY—The individual designated by the commander to release home town news in block two of the Fleet Home Town News Release Form (NAVSO 5724/1).

COMMAND WELCOME INFORMATION—See WELCOME ABOARD BOOKLET.

COMPACT DISC—A 4 3/4-inch plastic platter with digitally encoded audio. When inserted in a compact disc player, the disc is seamed by a laser beam positioned above it, thus producing superior audio.

COMPILATION CUTTING—In television, a videotape editing technique whereby segments are tied together through narration.

COMPUTER GRAPHIC—In television, an electronic picture stored digitally in a computer that may be recalled for airing or altering by a graphic artist.

CONTINUITY CUTTING—In television, a commonly used videotape editing technique for news or feature releases when the storytelling is dependent on matching consecutive scenes. Continuity cutting includes the cutaway and cut-in.

CONTRAST—In still photography and television, a general term referring to differences among extremes of tone values in negatives, prints and subject or lighting. When the difference is great, the contrast is called high, hard or contrasty; when the difference is slight, the contrast is soft, flat or low.

COPY—A term used to describe all news manuscripts and text or artwork to be printed in a publication.

COPY EDITING—The process of locating and correcting inaccuracies in a news manuscript before they can be printed and distributed.

COPY EDITING SYMBOLS—A special set of symbols used by a copy editor to make corrections, additions or deletions in copy.

COPYRIGHT—The exclusive right of possession given an individual by law to protect his literary works; musical works (including any accompanying words); dramatic works (including any accompanying music); pantomimes and choreographic works; pictorial, graphic and sculptural works; motion pictures and other audiovisual works; and sound recordings.

COUNTDOWN LEADER—In television, the numbers that appear on videotape before the actual program begins. Countdown leader is used to facilitate precise cuing.

CREATED NEWS—News that is generally concerned with something the Navy, or some

person or organization has done or plans to do and wants the public to know about.

CREDIT LINE—The final portion of a cutline used to acknowledge the originator of a photograph.

CROP—The act of blocking out unwanted portions of a photograph, either by cutting the print or by enlarging or contact printing.

CROSSCUTTING—In television, the use of shots from two different actions or events that will finally be related.

CUE—(1) In radio and television, the act of presetting programming materials so that they are available for immediate airing. (2) The signal given to the talent by the floor manager, meaning “begin action” or “start talking.”

CUE DOTS—In television, the small, white squares that appear in the upper right-hand corner of the television screen when certain American Forces Radio and Television Service (AFRTS) videocassettes are played. Programs on multiple videocassettes are recue-dotted at 10, seven and two seconds from the end of each tape, except the last tape of the program.

CUTAWAY—In television, a secondary action shot used to change positions, movements or characters or to denote a lapse of time.

CUT-IN—In television, a primary action shot from the main scene that is relevant to the mood or action.

CUTLINE—The explanatory matter that accompanies a photograph. A cutline supplements a photograph by explaining action, naming people and giving background information.

CUTOFF LINE SYSTEM—In television, natural dividing lines that assist the director in producing aesthetically pleasing shots.

CUTOFF RULE—A rule or line placed horizontally across one or more columns to separate units, such as boxes and multicolumn heads, from the rest of the page.

CYLINDER—*See* PLATEN.

DAISY WHEEL—In typewriters and printers, the mechanism used to print keyboard characters. The individual characters of a daisy wheel are mounted in a circular pattern and connected to a hub with spokes; the whole unit resembles a daisy. When a character on the keyboard is depressed, the

daisywheel rotates until the correct character is in place.

DATELINE—The lead-in line of a cutline or story that gives the point of origin.

dB (DECIBEL) GAIN SWITCH—In television, a switch used to increase the video output of a camera. The dB gain switch normally has two positions —6dB and 12dB.

DEPTH—In still photography, an illusion of three dimensional space that is sometimes created by a combination of favorable lighting and coloring of the set and favorable viewing conditions for the reproduction.

DEPTH OF FIELD—The distance between the points nearest and farthest from the camera that are acceptably sharp at a given lens setting.

DESIGN—The function of planning for the total structure of a newspaper page before any layout work is done.

DESIGN, BRACE—*See* DESIGN, FOCUS.

DESIGN, CIRCUS—A traditional front-page newspaper design pattern in which each individual element competes for the reader’s immediate attention, resulting in no clear focus of interest on the page.

DESIGN, FOCUS—A traditional front page newspaper design pattern in which the headlines and pictures are positioned on the page to form a diagonal line from the upper left-hand corner to the lower right-hand corner.

DESIGN, FUNCTIONAL—A contemporary front page newspaper design pattern in which the page is made up in a reamer that will be most appealing and convenient to the reader.

DESIGN, GRID—A contemporary front-page newspaper design consisting of modules of varying sizes with the grid lines formed by the spaces between columns and the spaces separating stories.

DESIGN, HORIZONTAL—A contemporary front page newspaper design pattern where elements are placed on the page. The page is made up with the elements being placed on the page so the majority of the elements present a horizontal display.

DESIGN, MODULAR—A contemporary front page newspaper design pattern where pleasing

blocks(modules) of vertical and horizontal rectangles are combined.

DESIGN, RAZZLE-DAZZLE—*See* DESIGN, CIRCUS.

DESIGN, SINGLE THEME—A contemporary front page newspaper design that emphasizes a single, Important story or issue without the use of stories or reefers.

DESIGN, TOTAL THEME—A contemporary frontpage newspaper design that emphasizes a single, important story or issue with a large photograph (or line art) covering the entire area, a single story and photograph, or a billboard (dominant photograph with page reefers to major stories).

DESKTOP PUBLISHING—The use of a microcomputer, page layout software and a laser printer to generate typeset-quality graphics and text.

DIRECTIVE—A type of correspondence that prescribes or establishes policy, organization, conduct, methods or procedures; requires action or sets forth information essential to the effective administration or operation of activities concerned; or contains authority or information that must be issued formally.

DIRECTOR—In television, the individual in charge of the studio production team. The director gives instructions to every member of the team, either directly, or in the case of the talent, indirectly.

DISPLAY SCREEN—Another name for a computer monitor.

DMI—Defense Media Institute. Provides specialized instruction for all military service personnel in the public affairs field.

DOLLY—In television, a secondary camera movement where the camera and pedestal are moved toward or away from the subject.

DOMINANT ELEMENTS—*See* NEWS PEG.

DUMMY—The process of indicating where each element will be placed on a layout sheet (sometimes called dummying or roughing in).

ECHO—In radio, the repetition of sound usually achieved by using a reel-to-reel tape recorder.

ECU—Editing control unit. In television, a piece of electronic equipment used to control the playback

and edit/record videocassette recorders during videotape editing.

EDITING CELL—An area of a television studio devoted to videotape editing. Most editing cells in NBS detachments include a playback video cassette recorder (VCR), edit/record VCR, two television monitors, audio mixer and an editing control unit (ECU).

EDITORIALIZING—A violation in news writing that occurs when the writer consciously or unconsciously expresses doubt, censure or praise in a news story or headline.

ELECTRONIC FLASH—In still photography, a high voltage light source for illumination, producing a momentary flash of light of high intensity.

ENG—Electronic News Gathering. In television, the use of a portable video camera and portable video cassette recorder to cover news.

ENLARGER—In still photography, a photographic projection printer.

EQUALIZER—In radio and television, a piece of equipment that alters the frequency response of an audio signal, allowing modification of specific portions of the overall signal. Equalization does not eliminate frequencies totally, but it will vary their playback levels.

ESSENTIAL AREA—In television, the portion of a visual that must include all the important information to ensure its reception by the viewer.

EXPOSURE—In still photography, a predetermined combination of shutter speed and lens aperture that allows light to pass through the lens and strike the film .

EXTREME CLOSE-UP (ECU)—In television and still photography, a shot where the talent or subject practically fills the screen or frame.

EXTREME LONG SHOT (ELS)—In television and still photography, a shot that produces a very wide field of view.

FADE—In radio and television, the gradual decrease or increase of the audio or video signal.

FEATURE NEWS—News that centers on an event or situation that stirs the emotions or imagination of an individual.

FEATURE STORY—A story that not only entertains, but is informative because it contains all the elements of a news story.

FHTNC—Fleet Home Town News Center. Administers the Fleet Home Town News Program.

FILE, ALIBI—A public affairs office file that contains query sheets and copies of news advisories released to the news media. Although a separate file, the news release file is also called an alibi file.

FILE, CLIP—A public affairs office file that contains clippings of stories that have been released and have appeared in print.

FILE, COMMAND—A public affairs office file that contains reference material pertaining to the command, such as the command history and biographies of the CO, XO and C/MC.

FILE, COMMUNITY RELATIONS—A public affairs office file that contains the names, addresses and telephone numbers of civic leaders and community groups with which the command maintains contact.

FILE, CORRESPONDENCE AND MEMOS—A public affairs office file that contains all outgoing and incoming official correspondence and memos.

FILE, FLEET HOME TOWN NEWS—A public affairs office file that contains a 90-day logbook or index file of each release form mailed to the Fleet Home Town News Center (FHTNC). For deployed units, this file contains copies of every release form that is part of a hold file.

FILE, FUTURE—A public affairs office file that contains a current listing of all events that have been scheduled or planned for the future.

FILE, MATTERS PENDING—A public affairs office file that maintains notes and reminders on pending ideas that may be useful for news releases, feature stories, news pegs for special events and other public affairs activities.

FILE, MEDIA RELATIONS—A public affairs office file that contains a listing of all media in the local area and any pertinent amplifying information.

FILE, NEWS RELEASE—A public affairs office file that contains the original news releases distributed to the media. The news release file is also called an alibi file.

FILE, PHOTOGRAPHIC—A public affairs office file that contains photographs of the ship underway or points of interest within a shore command. The photographic file also contains photographs to accompany biographies of the CO, XO and C/MC.

FILE, PROJECT—A public affairs office file that contains past, present and future public affairs projects involving the command.

FILE, SPEECH—A public affairs office file that contains copies of all prepared speeches and other presentations delivered by members of the command in connection with the speakers bureau. It also contains background material for future speeches.

FILM—A light-sensitive emulsion of silver halides suspended in gelatin and coated on a transparent and chemically neutral base, usually cellulose or polymer plastic.

FILM SPEED—*See* ISO.

FILTER—(1) In photography, a layer of colored glass, gelatin or other material used to alter the characteristics of light before it reaches the film. (2) In radio and television, an electronic circuit designed to pass only selected audio frequencies while eliminating all others.

FILTER, COLOR COMPENSATING—A filter used to change the overall color balance of photographic results obtained with color film and to compensate for deficiencies in the quality of the light when printing color films.

FILTERS, KODAK WRATTEN™—A line of filters used in black-and-white photography.

FIVE Ws, THE—The who, what, when, where, why (and sometimes how) that a journalist attempts to answer in writing a summary lead.

FLAG—A newspaper device used to indicate section pages or special pages, such as editorial, sports and family pages.

FLASH—*See* ELECTRONIC FLASH.

FLOOR MANAGER—In television, a member of the studio production team who is in charge of all activities on the studio floor. The floor manager's main responsibility is to communicate instructions from the director to the talent using hand signals.

FLOPPY DISK DRIVE—A secondary storage device that uses a removable magnetic disk (floppy disk).

FLUSH—To place copy even with the column margin on either the left or right. Usually designated “flush left” or “flush right.”

FOCAL LENGTH—The distance from the optical center of the lens to the focal plane (film plane) when the camera is focused upon an object at infinity.

FOCAL PLANE—The surface (plane) on which an axial image transmitted by a lens is brought to its sharpest focus.

FOCAL POINT—A point on a newspaper page where the reader normally looks for the most important story.

FOCUS—To adjust the position of either the lens or focusing screen in a camera or projector to secure the sharpest possible image of the object.

FOLIO LINE—A newspaper’s identification line on each page.

FOLLOW-UP STORY—A story written to update the developments of a previous story.

FOOTCANDLE—A basic measurement used to gauge the intensity of light.

FORMAL BALANCE DESIGN—A traditional front page newspaper design pattern in which the page is divided in half vertically and each element on one side of the vertical centerline is duplicated by the same treatment of elements at the same point on the opposite side.

FREEDOM OF INFORMATION ACT, THE—A law established to give the public the right to access records of the executive branch of the federal government.

f/STOP—A numbered diaphragm opening through which light enters the camera; f/stops are usually calibrated to change the amount of light by a factor of two times with each succeeding number.

GAIN—The level of amplification for video or audio signals.

GAIN CONTROL—*See* POT.

GALLEY PROOF—The initial copy of a typeset story used for proofreading and annotating typesetter errors.

GROUND GLASS—A sheet of glass with a grained or matte (translucent) surface, such as a focusing screen or a diffusing screen.

HALFTONE—The technique used to reproduce photographs or drawings with tonal qualities through the process of creating a pattern of dots or lines; the lighter the tone, the smaller and farther apart the dots.

HANDOUT—A term used by civilian editors to describe a standard news release.

HARD NEWS—A type of news story designed primarily to inform the reader, listener or viewer.

HEAD, BANNER—A headline that is set the full-page width at the top of a news page to draw attention to the lead story or the page in which it appears.

HEAD, CROSSLINE—A headline similar in appearance to a banner head, except it does not always span the full width of the page. However, the crossline head covers all the columns of the story to which it pertains.

HEAD, FLUSH LEFT—A two- or three-line headline with each line set flush left.

HEAD, HAMMER—A headline variant that is set twice the size of the main head, set flush left and is no wider than half the width of the headline area. Also known as a reverse kicker.

HEAD, JUMP—A headline variant designed to help the reader find a portion of a story continued from another page.

HEAD, NOVELTY—A headline variant that features typographical tricks, such as setting part of the head upside down, using an ornate typeface or substituting artwork as characters.

HEAD, SIDE—A headline that runs alongside a story.

HEAD, SKYLINE—A banner headline set above the flag or nameplate.

HEAD, STANDING—A headline variant used for regular or recurring content, such as sports and chaplains’ columns. The standing head does not change from issue to issue.

HEAD, STREAMER—The widest and biggest multicolumn headline on a page, regardless of whether it is set the full width of the page.

HEAD, TRIPOD—A headline variant characterized by a single, short line of larger type set to the left of

two lines of smaller type. The tripod portion (larger wording) should be twice the size of the definition or main headline.

HEAD, WICKET—A headline variant characterized by a short line of larger type set to the right of two lines of smaller type. The wicket is essentially a tripod head in reverse, sans colon.

HEADLINE—A newspaper device that attracts the reader to a story, usually by summarizing the contents of the story (also referred to as a “head”).

HEADLINE SCHEDULE—A keyed record of all the headlines used in a particular newspaper and usually specifying the unit count for each.

HOLD FILE—A collection of Fleet Home Town News Release Forms (NAVSO 5724/1) submitted to the Fleet Home Town News Center (FHTNC) by a deploying unit. The hold file is used to process master (roster) stories, such as the deployment, mid-deployment and end-of-deployment stories.

HOUSE ORGAN—A publication printed by a business or organization that is intended primarily for internal readership.

HUE—In television, the actual color of light.

INITIAL LETTER—A large, ornate capital letter used at the beginning of a paragraph.

INSERT EDITING—In television, an editing mode whereby the editor may add or change video or audio separately or together without affecting the control track.

INSTRUCTION—A directive that contains authority or information having continuing reference value or requiring continuing action. It remains in effect for 7 years or until it is superseded or otherwise canceled by the originator or higher authority, whichever occurs first.

INTERVIEW—A conversation between two people, one of whom seeks information from the other.

INTERVIEW, AD-LIB—In radio and television, an interview method that is totally unrehearsed or “off the cuff.”

INTERVIEW, INFORMATION—In radio and television, a type of interview designed to inform the audience.

INTERVIEW, MAN ON THE STREET. *See* INTERVIEW, OPINION.

INTERVIEW, OPINION—In radio and television, an interview whereby the thoughts or opinions of the interviewee are highlighted, such as the “man on the street” interview.

INTERVIEW, PERSONALITY—In radio and television, an interview that highlights the accomplishments of an individual or the position you hold.

INTERVIEW, SCRIPTED—In radio and television, an interview method in which all the questions and answers are prepared in advance and the interviewee(s) read from a prepared text.

INTERVIEW, SEMI-SCRIPTED—In radio and television, an interview method in which the interviewer researches the interviewee and subject matter, reviews possible questions with the interviewee in advance, and in some instances, rehearses the interview.

INVERSE SQUARE LAW—The intensity of light received at a point varies inversely as the square of the distance from the source. The law holds for relatively small sources only and is useful in calculating photographic exposures.

INVERTED PYRAMID—The standard straight news story form in which the writer arranges the facts in descending order of importance.

IRIS DIAPHRAGM—A term applied to the adjustable aperture fitted into the barrel of a photographic lens and so-called because the contraction of the aperture resembles that of the iris (pupil) in the human eye.

ISO—In still photography, the standard that indicates the sensitivity (film speed) of black-and-white and color film. ISO is an acronym for International Standards Organization, a federation of all national standards bodies of the world.

JUMP CUT—In television, an awkward or jarring transition between two camera shots.

KELVIN—The measurement of the color of light in degrees. Numerically, the Kelvin temperature is equal to the Centigrade temperature plus 273 degrees.

KEYBOARD—An input device used with computers that includes alphabetic, numeric, punctuation, symbol and control keys.

KICKER—An underscored line of display type placed above the main headline and to the left

margin of the copy block. The kicker is one-half the size of the main headline and it is usually one-third to one-half the length of the main headline.

LATENT IMAGE—The image recorded by light on the light-sensitive emulsion that remains invisible until developed.

LATITUDE—In still photography, the amount by which a negative may be overexposed or underexposed without an appreciable loss of image quality.

LAYOUT—The overall pattern of the elements on a page, showing the arrangement of pictures, text and headlines.

LEAD—Pronounced “leed.” The first and most important paragraph of any news story. It attracts the reader and states the important facts first.

LEAD, SUMMARY—A news story lead that briefly summarizes the most important facts in the story.

LEADING LINES—A photographic technique used to direct attention toward the point of interest.

LENS—In still photography and television, the optical instrument or arrangement of light-refracting elements in a group; the lens is designed to collect and distribute rays of light in the formation of an image.

LENS, WIDE ANGLE—A lens of a shorter, final-length than the standard lens, used to get more area into the picture.

LENS, ZOOM—A variable final-length lens.

LETTER, BUSINESS—A form of correspondence generally used when writing agencies or individuals outside the Department of the Navy (DON) or Department of Defense (DoD).

LETTER OF TRANSMITTAL—A cover document used to submit 10 or more Fleet Home Town News Release Forms (NAVSO 5724/1).

LETTER, STANDARD NAVAL—Official correspondence used when writing to other naval commands or organizations within the Department of Defense (DoD).

LIBEL—A published (written, printed or pictured) defamation that unjustly holds a person up to ridicule, contempt, hatred or financial injury.

LIBEL PER SE—The more obvious and serious of the two forms of libel. Libel per se means “by itself” or “on the face of it.”

LIBEL PER QUOD—The least obvious of the two forms of libel. Libel per quod means “because of circumstance” or “by means of circumstance” and is committed by inference.

LIGHT, AVAILABLE—*See* LIGHT, EXISTING.

LIGHT, BOUNCE—In still photography, an electronic flash lighting technique in which the light source is directed at the ceiling or wall and bounced back to the subject as indirect light.

LIGHT, EXISTING—In still photography, the light that happens to be on the scene, such as light from table, floor and ceiling lights, neon signs, windows, skylights and candles.

LIGHT, FILL—In television, light used to fill in and soften harsh shadows created by the key light.

LIGHT, KEY—In television, the main light source providing sufficient light to operate the camera. The key light serves as the reference point for all other lighting.

LIGHT, NATURAL—*See* LIGHT, EXISTING.

LINE ART—Any piece of solid color art (illustrations, rules, headlines, borders, cartoons, crossword puzzles, etc.) suitable for photographing without the use of a halftone screen.

LIVE—(1) In radio and television, a program that is aired in realtime (as it happens). (2) A term used to describe a piece of equipment that is turned on, such as a “live microphone.”

LONG SHOT (LS)—In television and still photography, a shot that produces a full view of the scene, including details of background as well as foreground. When the director calls for a long shot, it normally will include five or six people.

MAKE-UP—The process of arranging pictures, headlines and news stories in a page layout to obtain maximum effectiveness.

MASTHEAD—A statement in a newspaper that gives the reader information about the publication, such as the name of the publisher, frequency of publication, names of staff members and the addresses or telephone numbers of either the editorial office or publisher (or both).

MEDIA—Plural form of the word medium; a term used to identify all ways and means of communicating news, information and entertainment to a relatively large audience.

MEDIA INFORMATION KIT—A folder that contains useful background information on a ship or station or a particular news event.

MEDIUM CLOSE-UP (MCU)—In television and still photography, a shot that normally includes the head and shoulders of the talent or subject.

MEDIUM LONG SHOT (MLS)—In television and still photography, a shot between the long shot (LS) and extreme long shot (ELM).

MICROPHONE, BIDIRECTIONAL—A microphone with a bidirectional polar pattern, allowing it to pick up sound in two directions.

MICROPHONE, BOOM—A unidirectional microphone attached to a hand-held pole, allowing the microphone to remain outside of camera range.

MICROPHONE, CONTACT—*See* MICROPHONE, HIDDEN.

MICROPHONE, DESK—A stationary microphone used primarily when the talent is working from behind a desk or lectern.

MICROPHONE, HAND—A unidirectional microphone normally used during ENG shooting assignments and audience participation programs.

MICROPHONE, HANGING—A stationary microphone used when a boom microphone is impractical because of lack of space or when a large set will not permit rapid boom movement. The hanging microphone is hung from the ceiling or overhead by its cable, placing it out of normal camera range.

MICROPHONE, HIDDEN—A stationary microphone often used to record the sound of an object to which it is in direct contact.

MICROPHONE, LAVALIERE—A small unidirectional microphone used by the talent and normally clipped or taped to an article of clothing.

MICROPHONE, LAVALIERE (DUAL REDUNDANCY)—Two lavalier microphones attached to the same clip. One microphone is live; the other serves as an emergency backup in case the primary microphone fails.

MICROPHONE, OMNIDIRECTIONAL—A microphone with an omnidirectional polar pattern, allowing it to pick-up sound in a 360-degree radius.

MICROPHONE, STAND—A stationary microphone used when the sound source is immobile and the microphone may be seen on camera.

MICROPHONE, UNIDIRECTIONAL—A microphone with a unidirectional polar pattern, allowing it to pick-up sound from only one direction

MICROPHONE, WIRELESS—A standard lavalier microphone connected to a battery-powered radio transmitter that relays a radio signal to a receiver in the audio control room. Used in productions where cable-free operations are desired.

MORE—A direction typed at the end of a page of copy to indicate that the story does not end there —more is coming.

MOTOR DRIVE—A mechanical device used with a 35mm single-lens reflex (SLR) camera that fires the shutter and advances the film for a preset number of exposures.

MUSIC BACKGROUND—In radio, music that helps set the mood of a radio program and increases audience appeal.

MUSIC, BRIDGE—In radio, music that connects or “bridges” together two ideas or thoughts in a radio program.

MUSIC, FILL—In radio, music used to fill time at the end of a radio program.

MUSIC, THEME—In radio, music that helps identify the subject or character of a radio program.

MWR—Morale, Welfare and Recreation. Unimportant source for information regarding recreation, intramural and youth programs.

NAMEPLATE—The name of a newspaper in large type at the top of the front page.

NAVSO 5724/1—The Fleet Home Town News Release Form (Rev. 8-88). The only authorized form for all home town news releases.

NBS—Navy Broadcasting Service. Manages AFRTS outlets within the DON.

NEC—Navy Enlisted Classification. A four-digit number that indicates a special qualification earned by an individual.

NEGATIVE—A photographic image on film or paper in which light tones are rendered dark and dark tones appear light.

NEWS, SOCIAL—News that most often deals with the activities of officers and enlisted wives' clubs, the happenings of the teenage set, weddings and local charity events.

NEWS, SPORTS—News that chronicles the activities of athletic teams, discusses upcoming games and details the accomplishments of sports figures.

NEWS, SPOT—News obtained on the scene of the event, hence fresh, live news. Usually used to refer to unexpected events.

NEWS ADVISORY—An abbreviated form of a standard Navy news release intended to get the news media to cover an event themselves.

NEWS CONFERENCE—A meeting between an official spokesperson and news correspondents conducted primarily to provide the correspondents with information necessary to report a news event accurately, particularly a fleet exercise, special event or VIP visit. Normally, a news conference is arranged only when the news is of such magnitude that it cannot adequately be disseminated through an official Navy news release.

NEWS PEG—The most significant or interesting fact in a story, usually featured in the first paragraph.

NEWS RELEASE—*See* RELEASE and RELEASE, STANDARD NAVY NEWS.

NEWSPAPER BROADSHEET—*See* NEWSPAPER, FULL-FORMAT.

NEWSPAPER, COMPACT—*See* NEWSPAPER, MAGAZINE-FORMAT.

NEWSPAPER, FULL-FORMAT—A newspaper that measures 16 or 17 inches wide and 21 to 22 inches deep (a full metropolitan daily-sized newspaper).

NEWSPAPER, MAGAZINE-FORMAT—A newspaper about half the size of a tabloid newspaper. It measures 7 to 8 inches wide and 10 to 11 inches deep.

NEWSPAPER, TABLOID—A newspaper that measures 10 to 12 inches wide and 14 to 18 inches deep. It is about half the size of a full-format newspaper.

NMPS—Navy Motion Picture Service. Provides most Navy ships with first-run movies on 1/2-inch Beta videocassettes.

NOTICE—A directive of a one-time nature or one that contains information or action for a brief time only. A notice usually remains in effect for less than six months, but is not permitted to remain in effect for longer than 1 year.

OCCSTD—Occupational standard. A task statement that describes a minimal professional requirement in a particular rate.

ON CUE—An instruction in a video news release that tells the talent to look at the television monitor in the studio and wait for the scene described in the video column to appear before continuing.

ONE-SHOT—In television, a shot that includes one talent.

ORAL PUNCTUATION MARKS—In radio, a series of diagonal lines added to copy to tell the announcer when to breathe, without disrupting the natural flow, phrasing and importance of a sentence.

ORNAMENTS—Any of several printer's devices, such as stars (dingbats) and dots (bullets), used to add interest and beauty to a printing job.

OSCILLOSCOPE—In television, a device used to display electronic signals visually and to setup and test television equipment.

PAN—In television, a secondary camera movement in which the camera is moved horizontally on a stationary pedestal (derived from "panorama").

PAO—Public affairs officer. A commissioned officer (1650 designator) trained to interpret and implement the theories and practices of Navy public affairs policy at the command level. At some smaller installations, the PAO may be an enlisted journalist or an enlisted person from another rating.

PAO, COLLATERAL-DUTY—A public affairs officer without the 1650 designator who has other assignments that are considered primary duties. In most cases, a collateral-duty PAO can devote only a minimal amount of time to public affairs work.

PA REGS—Short title for *U.S. Navy Public Affairs Policy and Regulations*, SECNAVINST 5720.44A. PA Regs provides the PAO and his staff with basic policy and regulations to carry out the public affairs and internal relations programs of the DON.

PEDESTAL—(1) In television, a device on which a camera is mounted. (2) A secondary camera movement where the camera is either raised or lowered on its pedestal.

PHASING—In radio, an effect usually used to enhance a person's voice and which is achieved when two identical audio sources are played back at slightly different start times.

PHOTO CAPTION—*See* CUTLINE.

PHOTOELECTRIC TRANSDUCER—*See* PICKUP TUBE.

PHOTOJOURNALISM—A means of communication where the main emphasis is predominantly achieved through photographs.

PICA—Printer's unit of measure; one-sixth of an inch or 12 points.

PICKUP TUBE—In television, a vacuum tube housed within a television camera that changes light into electrical energy. Also known as a photoelectric transducer.

PICTURE STORY—A planned, organized series of related pictures that tell a story.

PLATE—In offset lithography, the grained zinc or aluminum sheet that carries the image to be printed.

PLATEN—In typewriters and printers, the hard-rubber roller against which the individual letters or printer pins strike.

POINT—The unit of measurement in which type sizes are designated. One point is approximately one seventy-second of an inch; 12 points equal one pica.

POLAR PATTERN—In radio and television, the shape of the area around a microphone where it picks up sounds with maximum fidelity and volume.

POSTPRODUCTION—In radio and television, the last stage of the production process that largely involves quality control checks and final adjustments to the finished program.

POT—Potentiometer. In radio and television, a knob or slider used to vary the sound volume of an input to the audio console.

PREPRODUCTION—In radio and television, the primary production stage in which a live or taped program is planned and coordinated.

PRIMARY MOVEMENT—In television, movement in front of the camera, usually by the talent.

PRIVACY ACT, THE—A law that safeguards military and civilian government employees against the invasion of personal privacy and allows them to gain access to information about themselves.

PRODUCTION—In radio and television, the actual execution of a live or taped program.

PROJECTOR, CAROUSEL SLIDE—A visual communication medium used to project 35mm slides.

PROJECTOR, OPAQUE—A visual communication medium primarily used to project graphs, photographs and other visual aids that are too small to be seen but should be shown in their actual form.

PROJECTOR OVERHEAD TRANSPARENCY—A visual communication medium used to project the contents of a transparent overlay (text, illustrations or both).

PUBLIC AFFAIRS OFFICE—The office responsible for managing all command public affairs functions, such as public information, internal information and community relations.

QUADRANT DESIGN—A traditional front page newspaper design pattern where the page is divided into four quarters, and a dominant, eye-stopping element (picture or headline) is placed in each quarter so that diagonal quarters balance each other.

QUERY—A request for specific information by a reporter, usually made by telephone.

QUERY SHEET—A specially designed sheet used to document a query made by a reporter.

QUOTE—A portion of a story that contains the exact words of a speaker or writer.

RACK FOCUS—In television, the process of setting the focus on an object in the field of view. With rack focus, only the object focused upon and other

objects at the same distance will remain in focus—as long as the distance between them and the camera does not change.

RED EYE—In still photography, an effect that occurs in pictures of people and animals when the flash is used close to the optical axis of the lens and the subject is looking at the camera.

REEFER—A headline that refers the reader to an article inside the newspaper.

REEL-TO-REEL TAPE RECORDER/REPRODUCER—A type of tape recorder/reproducer that uses 1/4-inch magnetic tape supplied on spools. The tape, available in several reel sizes and tape lengths, must be threaded onto the machine, where it passes the tape heads at either 7.5, 15 or 30 inches per second (ips).

RELEASE—Information previously limited to a controlled number of persons that is made available to the general public. The release may be any material (written, printed, oral or photographic) that has been properly cleared and authorized for dissemination to the public by the Navy through any media.

RELEASE, ADVANCE NEWS—A type of release written to promote a scheduled special event.

RELEASE LINE—The portion of a news release that describes the urgency of the material, normally one of the following designations: For Immediate Release, For General Release, Do Not Use After (time and date) and Hold For Release Until (time and date).

RELEASE NUMBER—An identifying number assigned to a standard Navy news release.

RELEASE, RADIO NEWS—A type of news release designed for dissemination to radio stations and written in broadcast style.

RELEASE, STANDARD NAVY NEWS—A formal document, written in news style, concerning Navy activities approved for public dissemination by an authorized person. The enlisted journalist normally prepares and edits it, then the PAO, through the authority of the officer-in-command, approves the release.

RELEASE, VIDEO NEWS—A type of news release that accompanies a videotape. The release is actually a script divided into two columns; the left column is devoted completely to the video, or

visual, section and the right column to the audio, or sound, section of the release.

REMOTE—In radio and television, a broadcast that originates outside the studio of a station.

REVERB—In radio, the persistence of sound until it fades away, usually achieved when a cartridge machine is used.

REVERSE KICKER—*See* **HEAD HAMMER**.

RHETORICAL QUESTION—A question that cannot be answered with a straight yes or no answer; it is asked mainly for effect with no answer expected.

ROUGH—The initial manuscript of a story, normally typed double-spaced on one side of the paper only.

RULE OF THIRDS—A photographic concept where the photographer mentally divides the frame into thirds (both vertically and horizontally) and places the point of interest at one of the four intersections of these lines.

RUN AND RETURN STORY—A type of story processed by the Fleet Home Town News Center (FHTNC) in which the appropriate Fleet Home Town News Release Form(s) (NAVSO 5724/1) is/are returned to the submitting command after processing.

SATURATION—In television, the actual strength of a particular color.

SCALE—The process of either enlarging or reducing a cropped photograph or artwork to fit in a hole on a newspaper page.

SCALE FOCUSING—In still photography, a calibrated scale that permits focusing a camera without the use of a rangefinder or ground glass.

SCANNING—In television, the process of registering all the elements of a video picture in sequence. During the scanning process, the television camera “encodes” the elements, then the television receiver is used to “decode” them in the proper order to recreate the original image.

SCANNING AREA—In television, the total area seen by the camera and reproduced on the studio monitor.

SCREEN—In television and still photography, a small metal screen placed in front of a lighting instrument to reduce its intensity.

SCRIM—In television and still photography, a piece of clear, spun glass or gauze used to diffuse and soften a light.

SECONDARY MOVEMENTS—In television, camera movements used to follow the primary movement of the talent or to change or adjust picture composition.

SHOOTING SCRIPT—A written plan for a picture story.

SHOT—(1) In still photography, a single exposure or photograph. (2) In television, a single scene; the continuous action occurring from the time the camera is turned on to the time it is turned off.

SHUTTER RELEASE—A device used to actuate a camera shutter.

SHUTTER SPEED—In still photography, the length of time that light is permitted to act upon film or paper as a result of the shutter having opened and closed.

SIC—A term used to show the reader that quoted matter contains an error, but is reproduced precisely. It is normally used within brackets: [sic].

SIDE LIGHTING—In still photography, the type of lighting effect used to bring out the texture of a subject.

SILHOUETTING—A photographic technique in which the subject is backlighted and then underexposed.

SILVER HALIDE—A light-sensitive silver salt, especially silver chloride or silver bromide, suspended in gelatin and used for coating photographic film, plates or papers.

SITE—Shipboard Information, Training and Entertainment system. Any of several closed-circuit television systems aboard authorized U.S. Navy ships and submarines.

SLIDER—*See* POT.

SOUND EFFECT—In radio and television, any noise used to enhance the spoken word.

SPEAKERS BUREAU—A list of speakers from within the command who talk on a variety of subjects. Administered by the command's public affairs office.

SPLICE—The process of joining two pieces of audiotape at a predetermined location.

SPOT ANNOUNCEMENT—In radio, a message designed to inform the listener or make him take some action. Most spot announcements are 60 seconds or less.

STET—A Latin term meaning “let it stand,” used on copy or galley proofs to indicate that a marked correction is in error and the copy should run as originally written or set.

STILL DIGITAL PHOTOGRAPHY—A photographic technique that allows a photographer to take pictures and store them electronically (digitally) in a specially manufactured camera. The pictures may then be processed using digital photographic software installed on a microcomputer.

STOP DOWN—In still photography and television, the use of a smaller aperture.

STRINGER—A person not assigned to a newspaper staff who contributes articles or provides information about an event.

STYLE—The spelling, punctuation, capitalization, abbreviation and similar mechanical aspects of grammar used in preparing copy.

STYLEBOOK—A compilation of rules that apply to a particular publication, including locally written policy on spelling, abbreviations, capitalization and several other areas.

SWITCHER, AUDIO—In television, a member of the studio production team who is responsible for operating the television audio-mixing console.

SWITCHER, VIDEO—In television, a member of the studio production team who is responsible for operating the video-mixing console and special effects bank.

T/W SWITCH—In television, the zoom servo lever that regulates the operation of a zoom lens (T for telephoto and W for wide angle).

TALENT—In television, the performer being photographed, such as the newscaster.

TALLY LIGHT—In television, the light atop the camera and inside the viewfinder that is illuminated when the shot produced by the camera is on the air.

TERTIARY MOVEMENT—In television, an effect produced from a sequence of shots involving two or more cameras.

THE ASSOCIATED PRESS—A not-for-profit, cooperative news service that services newspapers, magazines and radio and television stations.

THE ASSOCIATED PRESS STYLEBOOK AND LIBEL MANUAL—The recommended guide for preparing military news.

THIRTY (30)—A direction typed on the last page of copy to indicate the end of the story.

THREE-SHOT—In television, a shot that includes three talents.

TIE-BACK—A news writing device that allows the writer to refresh the reader's memory about past events related to the story being written.

TIE-IN—A news writing device that provides supplementary information to the story being written.

TILT—In television, a secondary camera movement wherein the camera is moved vertically on a stationary pedestal.

TONE—In a photographic negative or print, the degree of lightness or darkness of the various parts of the image.

TOUR—A planned program conducted for an individual or group designed to increase public awareness and understanding of a command and its mission.

TRACK, AUDIO—In television, the portion of the videotape that contains the audio information. Virtually all videotape formats provide enough space for the recording of two audio tracks.

TRACK, CONTROL—In television, the portion of the videotape that provides the necessary foundation to control and synchronize videotape editing and playback functions

TIME CODE ADDRESS—In television, the portion of the videotape used to record cuing information for editing, such as audio or visual time/frame identification.

TRACK, VIDEO—The portion of the videotape that contains the video information. The video track takes up about three-quarters of the available space on a videotape.

TRUCK—In television, a secondary camera movement wherein the camera is moved horizontally on its pedestal.

TWO-SHOT—In television, a shot that includes two talents.

TYPEFACE—The characteristic design of type. The following are the six main classes of type: Roman, Gothic, Text, Italics, Script and Contemporary.

TYPE FAMILIES—Typefaces that are similar, though not exactly alike in design.

TYPE FONT—A complete assortment of type of one size and style.

TYPE SERIES—The weight, width and angle of type. When a series carries only the family name, with no adjectives indicating variations in width, weight or angle, it may be assumed that the type is normal.

TYPOGRAPHY—The art of printing with type, involving the style, arrangement and appearance of the printed page.

UNIT COUNT SYSTEM (flit-j)—A method used to calculate the lengths of headlines by assigning numeric values to letters, numeric characters and punctuation characters.

VCR—Videocassette recorder.

VIDEO NOISE—An effect that occurs when the video signals produced by the pick-up tube of a camera are not strong enough to override the electronic interference the system usually generates.

VIDEOCASSETTE—A plastic container in which a videotape moves from a supply reel to a take-up reel.

VIDEOTAPE—A form of magnetic tape for recording pictures and sound that can be played back immediately without processing.

VIDEOTAPE, 8mm (Hi8)—A videotape format that is 8mm (approximately 1/3-inch) wide and housed in a plastic cassette.

VIDEOTAPE, 1/2-INCH BETA—A videotape format that is 1/2-inch wide and housed in a plastic cassette. The Beta format is not compatible with VHS (the other 1/2-inch videotape format).

VIDEOTAPE, 1/2-INCH VHS—A videotape format that is 1/2-inch wide and housed in a plastic cassette. The VHS format is not compatible with Beta (the other 1/2-inch videotape format).

VIDEOTAPE, 3/4-INCH U-MATIC—A videotape format that is 3/4-inch wide and housed in a plastic cassette.

VIEWFINDER—A miniature black-and-white television screen through which the camera operator views the scene being photographed.

VISUAL—In television, a device, such as a graphic or photographic technique, used to enhance a television production.

VU METER—Volume units meter. In radio and television, a device used on playback units and recorders to gauge soft and loud graduations of amplitude. Correct VU meter readings are achieved when average music and voice peaks fall between 80 and 100 percent.

WAVEFORM MONITOR—In television, a type of oscilloscope used to display a video signal graphically. Television technicians use the waveform monitor to set up and test studio television cameras.

WEBSTER'S NEW WORLD DICTIONARY, THIRD COLLEGE EDITION—The dictionary of first reference when spelling, style and usage questions are not covered in *The Associated Press Stylebook and Libel Manual*.

WELCOME ABOARD BOOKLET—A public affairs office publication that familiarizes visitors and guests with a ship or station. It normally contains a photograph of the ship (or the main gate of a shore command), CO's welcome letter, mission statement, brief history of the command and unclassified statistics and facts.

WIDE SHOT—*See* LONG SHOT.

WIDOW—A line of type at the top of a column that is less than one-half the width of the line measure of the article.

ZOOM—In television, a secondary camera movement similar to a dolly, but the camera does not move. It is done by zooming in or out with a zoom lens.

ZOOM FOCUS—In television, the process of zooming all the way in on the subject and setting the focus, then zooming out to the focal length desired. With zoom focus, everything in the depth of field will remain in focus, including the object focused on, provided the distance between it and the camera does not change.

ZOOM SERVO—In television, an electronically controlled motor that regulates the operation of a zoom lens.

Commanding Officer | <p>1-7. The main reason that hometown newspapers print personal items about Navy personnel is that the items contain which of the following news elements?</p> <ol style="list-style-type: none">1. Progress2. Consequence3. Proximity4. Prominence |
| <p>1-4. Which of the following traits will help you as a Navy Journalist to tell the Navy story?</p> <ol style="list-style-type: none">1. Practicing to become a better speaker2. Learning more about the Journalist rating3. Being up-to-date on current events in and out of the Navy4. Being an established typist | <p>1-8. What two basic elements of news are best illustrated by the sentence, “The Navy Department today announced that it has developed a new long-range weapon”?</p> <ol style="list-style-type: none">1. Immediacy and proximity2. Drama and immediacy3. Progress and immediacy4. Progress and proximity |

- 1-9. The story that a first class petty officer has made chief, if reported in the person's hometown newspaper, contains which of the following basic elements?
1. Consequence and immediacy
 2. Proximity and progress
 3. Immediacy and oddity
 4. Emotion and consequence
- 1-10. Today, if six men from your base were to volunteer for a dangerous diving mission, a story written about them would likely contain which of the following basic elements?
1. Immediacy, proximity and suspense
 2. Prominence, consequence and conflict
 3. Consequence, immediacy and prominence
 4. Prominence, suspense and progress
- 1-11. Elements of conflict and suspense would most likely be present in a story containing which of the following facts?
1. The rescue of a treed cat
 2. An increase in pay for all personnel
 3. A victory for a basketball team
 4. Three men who fought off sharks for four hours
- 1-12. The elements of sex and emotion would be present to the greatest degree in which of the following stories?
1. An English war bride finally reunited with her Sailor husband
 2. A basketball game with a close finish
 3. A woman who wins awards for rifle marksmanship
 4. An announcement of a single's picnic at a local military installation
- 1-13. The element of oddity is present in which of the following stories?
1. Twins who make chief on the same day
 2. Field day aboard a deployed ship
 3. The forced landing of a bomber
 4. The rescue of six men at sea
- 1-14. "The newly designated Under Secretary of the Navy, John T. McNaughton, was injured today in an airplane crash near Henderson, N.C. He was flying to Washington, where, in just three days, he would have been sworn into office." A story with the preceding lead features which of the following elements?
1. Oddity and immediacy
 2. Prominence and consequence
 3. Suspense and proximity
 4. Emotion and suspense
- 1-15. Which of the following elements must be present in every good news story?
1. Sex
 2. Human interest
 3. Immediacy
 4. Prominence of suspense
- 1-16. The term "news peg" refers to what factor(s)?
1. Who, what, when, where, why and how facts
 2. The dominant news elements of the story
 3. The length of the story
 4. The situation that the story concerns

- 1-17. Which of the following subjects is NOT spot news?
1. A collision of a bus in which several members of the Navy football team were injured
 2. A transcontinental record set by a Navy jet aircraft
 3. An explosion that caused serious damage and loss of life aboard an aircraft carrier at sea
 4. A christening and launching of a new nuclear submarine
- 1-18. A story about a ball to be held to raise money for the Navy Relief Society is considered what type of story?
1. Hard news
 2. Feature
 3. Sports
 4. Social
- 1-19. Off-duty military personnel volunteer to treat wounded Lebanese children. This subject is what type of story?
1. Hard news
 2. Feature
 3. Sports
 4. Social
- 1-20. A story about the new football coach at the Naval Academy in which his background and qualifications are detailed is what type of news story?
1. Hard news
 2. Feature
 3. Sports
 4. Social
- 1-21. A story about new regulations affecting military pay is what type of news story?
1. Hard news
 2. Feature
 3. Sports
 4. Social
- 1-22. A metropolitan newspaper article analyzing the consequences of a primary election is what type of news story?
1. Interpretive
 2. Financial
 3. Scientific
 4. Consumer
- 1-23. One of the major differences between the literary writing style and newspaper style is that newspaper journalists try to avoid using which of the following style elements?
1. Difficult or unfamiliar words
 2. Simple language and sentences
 3. Short sentences and paragraphs
 4. Complicated ideas as subjects
- 1-24. The writer should **NEVER** violate which of the following principles of newswriting?
1. Clarity
 2. Accuracy
 3. Emphasis
 4. Unity
- 1-25. Attribution is often necessary to assure which principle of newswriting?
1. Clarity
 2. Brevity
 3. Accuracy
 4. Unity

- 1-26. When writing a news release, what rule should you observe with regard to completeness and brevity?
1. Be brief although you may lack completeness
 2. Assure completeness, even though the article may be lengthy
 3. Be brief without sacrificing completeness
 4. Assure that the article is short, even though it may be incomplete
- 1-27. Writing a story so that facts are presented in some specific order is necessary for which of the following principles?
1. Coherence
 2. Emphasis
 3. Objectivity
 4. Unity
- 1-28. By injecting personal feelings or opinions in a straight news story, you violate which of the following rules?
1. Accuracy
 2. Objectivity
 3. Clarity
 4. Unity
- 1-29. You realize that the news story you are writing is developing into two basic topics. In this case, you should follow what recommendation?
1. Continue to combine all the facts into one story
 2. Select one of the topics and discard the facts on the other topic
 3. Eliminate the story and select another unrelated topic
 4. Write the topics as two separate news stories
- 1-30. Which of the following is NOT an axiom of newswriting?
1. Avoid gobbledygook
 2. Use well-known, often-used phrases
 3. Don't use unnecessary words
 4. Use specific words
- 1-31. Which of the following sentences contains a strong, active verb?
1. The tank slowly rolled to a stop
 2. The car wash was manned by the chiefs of the air station
 3. The ship's crew ate dinner with the admiral
 4. The men in the life raft were rescued by the destroyer
- 1-32. All **EXCEPT** which of the following are guidelines you should avoid when writing sentences?
1. Use a simple, declarative sentences
 2. Keep the word count consistent in sentences within the same paragraph
 3. Use compound sentences sparingly
 4. Use sentences that mirror normal informal conversation
- 1-33. To construct a good news or feature story, a JO must take good notes. Taking good notes includes which of the following techniques?
1. Taking notes in the same sequence as they appear in the final story
 2. Taking notes that are meaningful
 3. Writing legibly
 4. Both 2 and 3 above

- 1-34. The climax is always presented in the first paragraph in which of the following style(s)?
1. Pyramid
 2. Inverted pyramid only
 3. Literary only
 4. Inverted pyramid and literary
- 1-35. Which of the following is NOT an advantage of the inverted pyramid style?
1. Maintains reader interest by saving the climax until the end
 2. Presents facts rapidly and simply
 3. Makes page layout easier
 4. Makes writing headlines easier
- 1-36. The most important aspect of a news story is based on what news element?
1. The who
 2. The when
 3. The where
 4. The news peg
- 1-37. What is the purpose of a summary lead?
1. To present the essential facts quickly
 2. To give details to satisfy reader interest
 3. To make it possible for an editor to cut the story at any point
 4. To give the story coherence
- 1-38. The rule for including the five W's and H in the lead of a news story is correctly stated in which of the following principles?
1. Only the most important of these questions should be answered in a summary lead
 2. Only when and where questions are always answered in the lead
 3. Either four or five elements of the story should be included in the lead
 4. All six questions should be answered in the lead
- 1-39. To write a good lead, you should be limited to which of the following guidelines?
1. Only one paragraph
 2. Fewer than 30 words
 3. Not more than two sentences
 4. The fewest possible words, sentences, and paragraphs required to accomplish the objective
- 1-40. Which of the following leads answers all of the five W's?
1. Thirty minutes before he was to retire from the Navy, Clifford W. Royer, 45, a chief yeoman, was killed in an automobile accident today
 2. The Navy's highest award for bravery in action—the Navy Cross—was pinned on Seaman Emil James at a ceremony aboard the USS Greene
 3. A Navy jet pilot was killed today when his fighter crashed while on a training flight over a heavily wooded area near Glens Falls, N.Y.
 4. A veteran Navy diver, Clifford A. Patterson, 35, a Chief Machinist's Mate, lost his life yesterday in experiments to make underwater work safer

**IN ANSWERING QUESTIONS 1-41
THROUGH 1-45, SELECT FROM THE
FOLLOWING LIST THE TYPE OF NOVELTY
LEAD THAT FITS THE DESCRIPTION USED
AS THE QUESTION.**

- A. Contrast
- B. Picture
- C. Freak
- D. Punch
- E. Question
- F. Background
- G. Quotation
- H. Direct Address

1-41. Uses a play on words or comparisons.

- 1. A
- 2. B
- 3. C
- 4. D

1-42. Attempts to arouse the reader's curiosity.

- 1. A
- 2. C
- 3. D
- 4. E

1-43. Tries to make the reader part of the story.

- 1. B
- 2. F
- 3. G
- 4. H

1-44. Uses colorful phrases to create an image of the surroundings or setting of a news event.

- 1. A
- 2. B
- 3. C
- 4. F

1-45. Describes the person(s) involved in a story.

- 1. A
- 2. B
- 3. E
- 4. F

1-46. Which of the following types of leads is NOT a novelty lead?

- 1. Picture
- 2. Contrast
- 3. Summary
- 4. Direct address

1-47. Which of the following is a contrast lead?

- 1. From debutante to grease monkey is the goal of Navy woman Doris Barnes
- 2. Dazed but gratefully alive, EM3 Donald Clark struggled to his feet, rubbed his arms, and admitted that 440 volts are a lot of volts
- 3. Killer Cain strikes again
- 4. Who would have ever thought that FT2 George Regan was timid

1-48. Feature leads are sometimes used for which of the following purposes?

- 1. To attempt to answer all the five W's and the H
- 2. To add variety to a newspaper story
- 3. To give a strong narrative element

1-49. When should you identify the subject of a news story by more than just a name?

- 1. When the person is not well known to the readers
- 2. When the person is a familiar public official
- 3. When the action of the story is more important than the person involved
- 4. When the person is one of a group of persons involved in the action

- 1-50. Under what circumstances should the authority for information be given in the lead?
1. Whenever the authority is widely known
 2. When the source of information is clearly implied
 3. When it is necessary to credit the Navy with a story that deals with Navy ships and personnel
 4. When it is needed to overcome skepticism or to give support or emphasis to the information
- 1-51. When writing a lead, you should abide by all **EXCEPT** which of the following guidelines?
1. Answer all of the five W's and H
 2. Present a summary of the story
 3. Stress the news peg
 4. Get the reader interested in reading the rest of the story
- 1-52. The bridge can be used for which of the following purpose(s)?
1. To update the reader on events related to the story
 2. To elaborate, explain or provide authority to facts in the lead
 3. To provide a smooth transition from the lead to the body by bringing in secondary facts or filling in identification for the lead
 4. All of the above
- 1-53. When writing a second, or follow-up story about a news event, you may wish to remind the reader of the previously reported facts. You should do this with which of the following devices?
1. A background lead
 2. A tie-in
 3. A tie-back
 4. A bridge
- 1-54. To inform a reader about other events taking place that supplement the story you are writing, you should use which of the following devices?
1. A background lead
 2. A tie-in
 3. A tie-back
 4. A bridge
- 1-55. You should present the facts and details of a news story in what sequence?
1. In chronological order
 2. Ranging from greater to lesser importance
 3. With the most interesting details presented last
 4. With the story built to a climax

ASSIGNMENT 2

Textbook Assignment: “Writing the Feature, Speech, Sports and Accident Stories,” pages 3-1 through 3-23.

- 2-1. What type of story especially requires creative writing skills?
1. A straight news story
 2. An accident story
 3. A feature story
 4. A speech story
- 2-2. A feature story may be effectively substituted for a straight news release under which of the following circumstances?
1. When the time factor makes a straight news story non-competitive
 2. When the human interest of the story exceeds its value as straight news
 3. When the facts of a story depend on the prominence of an event or a personality profile
 4. Each of the above
- 2-3. All **EXCEPT** which of the following elements can turn a commonplace hobby into good material for a feature story?
1. The prominence of the individual
 2. A new development in the hobby
 3. An unusual or odd angle about the hobby
 4. A related story appeared in print
- 2-4. What is the **MOST** critical consideration for the feature story writer?
1. Word choice
 2. Consideration of the target audience
 3. Whether to write a straight news or feature story
 4. Permission to write the article
- 2-5. Navy Journalists often place feature stories in civilian newspapers to emphasize which of the following topics?
1. The importance of the event
 2. New equipment
 3. Individual Navy members
 4. The background of the event
- 2-6. A fact taken from the newspaper may be developed into a good feature article if it is written to reflect what interest?
1. Local
 2. National
 3. International
 4. Internal
- 2-7. Feature stories normally highlight what type of leads?
1. Summary only
 2. Novelty only
 3. Summary or novelty
 4. Any standard news or magazine style
- 2-8. What are the basic parts of a feature story?
1. Body, bridge and summary
 2. Lead, body and ending
 3. Lead, bridge and body
 4. Bridge, body and ending

2-9. Which of the following characteristics applies to a well-written lead for a feature story?

1. It contains either a question or a quotation
2. It always consists of more than one paragraph
3. It always corresponds to the prominence and proximity of the subject
4. It is appropriate for the subject and immediately arouses the reader's interest

2-10. To develop a good feature story on equipment, the journalist should use what technique?

1. Stress the ease of maintenance of the equipment
2. Emphasize the complexity of the equipment
3. Create human interest by stressing the people involved with the equipment
4. Stress the man-hours saved by the use of the equipment

2-11. In a feature story, quotations should be used for what reason?

1. To provide variety and add authenticity
2. To add color
3. To assist writing about controversial subjects

2-12. Which of the following suggestions for writing the body of feature stories will NOT increase reader interest?

1. Using a variety of sentence lengths
2. Comparing scientific concepts and technology to objects with which the reader is familiar
3. Translating technical terms into lay language
4. Avoiding figures of speech, such as comparisons and analogies

2-13. For writing feature stories, you should use which of the following literary techniques when dealing with numbers?

1. Avoid numbers if possible
2. Use comparisons to make the numbers meaningful
3. Use generalizations instead of exact numbers
4. Include exact numbers whenever possible

2-14. Which of the following training materials is best for aspiring feature writers?

1. Books and training manuals
2. Published feature material from other writers
3. Their own stories and experiences

2-15. The conclusion plays what part in the structure of a good feature story?

1. It can be readily cut from the story
2. It sums up or highlights the story
3. It restates the material in the lead
4. It includes the bridge

2-16. The personality feature differs from other feature stories in what respect?

1. It usually pertains to only one person
2. It arouses the reader's interest
3. It usually requires keen, inquisitive faculty for observation
4. It requires the imagination and curiosity of the writer

2-17. To write a personality feature, you may use all **EXCEPT** which of the following techniques?

1. Including the opinions of others about the subject
2. Telling of mannerisms and actions that are characteristic of the subject
3. Describing the subject's personal appearance, facial expressions and dress
4. Including personal descriptions that might be unflattering

2-18. To conduct research on a person for a personality feature, you may use which of the following sources?

1. The person themselves
2. Printed background material
3. Others who know the subject intimately
4. All of the above

2-19. In structure, a story written about a speech most closely resembles what other story?

1. A personality feature
2. An accident story
3. A straight news story
4. A feature story

2-20. Which of the five W's and H are usually included in the lead of the speech story?

1. Why and how
2. When and why
3. Who and what
4. How and what

2-21. When writing a speech story, you should use all **EXCEPT** which of the following techniques?

1. Always include a direct quote in the lead
2. Use brief, direct quotes and scatter them throughout the story
3. When paraphrasing, be careful not to distort the speaker's meaning
4. Include "when" and "where" in the lead

2-22. Which of the following sentences is NOT correctly punctuated with quotation marks?

1. The rescued man simply said, "wow"!
2. "Before the Vietnam Campaign," the speaker declared, "a longer training period was allowed."
3. He inquired, "Where is the action?"
4. "Enclose quoted material in quotation marks," the teacher stated.

2-23. What is an ellipsis?

1. A method of indicating that words have been deleted from a direct quotation
2. A quotation within a quotation
3. A paraphrase of a quotation
4. A substitute for a parenthesis

- 2-24. When a writer ends a quote in the middle of a speaker's sentence, what end punctuation should be used?
1. A period and quotation marks
 2. Three dots only
 3. Three dots and quotation marks
 4. Four dots and quotation marks
- 2-25. At what point in the speech story should the writer identify the speaker?
1. In the title
 2. In the first paragraph only
 3. In either the first or second paragraph
 4. In the summary
- 2-26. Which of the following elements of a speaker's identity need NOT be included in a speech story?
1. Full name
 2. Full title
 3. Hometown
 4. Job title
- 2-27. What is the purpose of the quote-summary method of reporting speeches?
1. To give the reader the feeling of the speech
 2. To make sure all pertinent information is included
 3. To standardize reporting throughout the industry
 4. To minimize the number of times attribution is necessary
- 2-28. Where is the natural placement for attribution of a direct quote?
1. At the beginning of the quote
 2. In the middle of the quote
 3. At the end of the sentence
 4. Anywhere within the same paragraph as the quote
- 2-29. What is the best way to express attribution in a speech story?
1. By using the verb "said" alone in most quotes
 2. By using a variety of vivid verbs
 3. By adding colorful details about the speaker's gestures and tone of voice
 4. By using "said" plus appropriate descriptive verbs
- 2-30. How may the journalist add more color to a speech story?
1. By using vivid words to describe how the speaker talked
 2. By occasionally describing the speaker's gestures or hand movements
 3. By using vivid verbs to describe the speaker's emotions
 4. By using a variety of adjectives and adverbs to paraphrase the quotes
- 2-31. Which of the following is NOT a key idea for speech writing?
1. Use ellipses to handle long quotes
 2. Place the most important fact in the lead
 3. Use vivid words freely to add color
 4. Attribute all information and opinions
- 2-32. What is the usual method of reporting a sports event?
1. A feature story approach
 2. A straight news story written in the inverted pyramid style
 3. In the quote-summary style
 4. With a roundup story approach

- 2-33. What is the main difference between a sports story lead and a straight news lead?
1. The sports lead emphasizes the who and how
 2. The sports lead does not necessarily include a news peg
 3. The sports lead will not be followed by a bridge
 4. The sports lead makes no attempt to answer the five W's and H
- 2-34. Where should the game's score be included in a sports story with a summary lead?
1. In the lead only
 2. In the lead and bridge only
 3. Throughout the story, as needed
 4. In the lead, only if not used in the headline
- 2-35. What type of lead should you use to maintain reader interest when the reader already knows the outcome of a sports event?
1. Background information
 2. Summary
 3. Novelty
 4. Punch
- 2-36. What information should be included in the bridge of a sports story?
1. Who won and the effect of the win on the standings
 2. When and where the event took place
 3. Who won the event and under what circumstances
 4. Where and how the win was accomplished
- 2-37. In the body of a sports story, events should be presented in what order?
1. Chronologically, skipping quiet periods
 2. By starting with the most important play
 3. From finish to start
 4. Chronologically, covering every period
- 2-38. When the key play is an error, the journalist should take what action?
1. Cover the play and fully identify the player
 2. Cover the play without identifying the player
 3. Cover the play and identify the player only if the play was critical to the outcome
 4. Don't mention the play
- 2-39. To a journalist who wants to write colorful sports feature stories, which of the following tips will be helpful?
1. Feature statistical comparisons
 2. Develop a set writing style
 3. Use good sports terms and colorful verbs
 4. Acquire personal information about sports stars
- 2-40. Which of the following terminology should be considered editorializing in sports writing?
1. Outstanding play

3. Underwater Demolition Team (UDT)
4. Either 2 or 3 above

- 5-18. Select the phrase or sentence that contains the incorrect use of abbreviations in newswriting.
1. 10:00 o'clock CST
 2. The Washington Redskins vs. Dallas Cowboys
 3. Jones & Son
 4. 1621 Grover Rd.
- 5-19. Select the phrase or sentence that contains the incorrect use of abbreviations in newswriting.
1. Zion National Park, Utah
 2. Yellowstone National Park, Ida.
 3. We visited the U. N. Building.
 4. Clark Field is near Manila, Luzon, R.P.
- 5-20. Select the phrase or sentence that contains the incorrect use of abbreviations in newswriting.
1. Frank R. Philips, the Prof., presented the lecture.
 2. Aubrey Crossland, B.S., M.S., is the head of the department.
 3. He enlisted Sept. 18, 1940, and was discharged in September 1945.
 4. His home is in Mount Clemens, Mich.
- 5-21. Select the phrase or sentence that contains the incorrect use of abbreviations in newswriting.
1. Ft. Worth, Texas
 2. Fort Bliss, Texas
 3. 155 mm howitzer
 4. St. Louis, Mo.
- 5-22. Of the following examples, which abbreviation is NOT correct in newswriting?
1. Johnson & Johnson
 2. 513 Clemson Dr.
 3. 201 Baker St. NW
 4. St. Paul, Minn.
- 5-23. What is the civilian editor's major complaint against military journalism?
1. The incorrect use of punctuation
 2. Excessive title and organization abbreviation
 3. Articles that lack completeness
 4. Excessive contradictions in the articles
- 5-24. Which of the following professional identifications are properly written?
1. Dr. (Army Captain) Henry Philips
 2. Navy Chaplain John Murphy, Lt.
 3. Navy Nurse Lt. Helen Brown
 4. Navy Commander (Dr.) Alice Robinson
- 5-25. Which of the following references to members of the clergy is NOT a correctly written title?
1. The Rev. Betty Jones, D.D.
 2. The Rev. Smith
 3. The Rev. Dr. John A. Parker
 4. The Rev. Mr. Thomas
- IN ANSWERING QUESTIONS 5-26 THROUGH 5-29, SELECT THE CLERGYMAN TITLE LISTED BELOW THAT CORRESPONDS TO THE FAITH GIVEN IN THE QUESTION.**

- A. The Most Rev. Frank Porter
- B. Reader Harvey
- C. Pastor Floyd
- D. President Claude Jones

5-26. Latter-Day Saints.

1. A
2. B
3. C
4. D

5-27. Christian Science.

1. A
2. B
3. C
4. D

5-28. Methodist.

1. A
2. B
3. C
4. D

5-29. Mormon.

1. A
2. B
3. C
4. D

5-30. Unlike regular Navy messages, press release messages are usually transmitted in news style.

1. True
2. False

5-31. Which of the following headings properly identifies a message news release?

1. PRESS RELEASE 0945Z 15 AUG 93
2. PRESREL 0945Z 15 AUG 93
3. PRESREL 150945Z AUG 93
4. 150945Z AUG 93 PRESS RELEASE

5-32. Which of the following date times does NOT indicate local time in an area outside of Greenwich Mean Time?

1. 111300Z
2. 171545U
3. 080730R
4. 231423K

5-33. When may a news message with no special instructions to the contrary be printed?

1. Immediately
2. After an interval of 24 hours
3. When security clearance is received
4. Simultaneously with other press releases

3. Allow the reader to obtain the most information in the shortest amount of time
4. All of the above

6-40. A detailed plan or sketch showing the arrangement of art, headlines and copy to guide in making up the actual pages is known by what term?

1. A paste-up
2. A dummy
3. A matrix
4. A pattern

6-41. In planning a page for a newspaper, the columns on your layout sheet should be drawn in which of the following ways?

1. To scale only
2. To size only
3. To scale or size, as desired
4. To rough approximation of actual size

6-42. On a layout sheet, what is the recommended way for you to indicate where a particular story goes?

1. Slug the story
2. Number the story
3. Write the lead on the layout sheet
4. Draw an arrow from the headline of the story to the space on the layout sheet

- 6-43. A story is under a two-column head with each column measuring 5 inches down the page. How many column inches does the story fill?
1. 5
 2. 2
 3. 7 1/2
 4. 10
- 6-44. You've typewritten a story that is 10-point type on two 8 1/2 by 11-inch paper, 45 lines long. Your newspaper has five columns at 14 picas each. How many column inches will your story occupy?
1. 5
 2. 11
 3. 15
 4. 22
- 6-45. What photograph cropping procedure is the most accurate and most commonly used by the Navy?
1. Masking
 2. Cutting
 3. Cutlining
 4. Marking margins with grease pencil or ink
- 6-46. You must crop a valuable photo of which you have only one print. What procedure(s) should you follow?
1. Marking with a grease pencil
 2. Scaling only
 3. Masking only
 4. Masking and scaling
- 6-47. You have a photo that is 3 inches wide and 5 inches deep. You wish to use it as a two-column picture, which is 5 inches wide. For the enlarged photo, how many inches in depth should you mark off on the layout?
1. 5 inch
 2. 8 inch
 3. 8 1/3 inch
 4. 8 3/4 inch
- 6-48. Concerning type size, 1/2 inch is equal to how many points?
1. 12
 2. 24
 3. 36
 4. 72
- 6-49. In measuring type, six picas is equal to how many points?
1. 12
 2. 24
 3. 36
 4. 72
- 6-50. A layout editor must be able to determine approximate length (in column inches) of a story from typed copy.
1. True
 2. False

ASSIGNMENT 7

Textbook Assignment: "Publications," chapter 8, (continued), pages 8-12 through 8-24.

7-1. The width of a line of type is measured in which of the following dimensions?

1. Picas
2. Points
3. Inches
4. Millimeters

7-2. The height of a letter of type is measured in which of the following dimensions?

1. Millimeters
2. Points
3. Picas
4. Inches

7-3. What term is used to describe the different styles of type?

1. Faces
2. Series
3. Families
4. Serifs

7-4. When selecting type, what should you consider first?

1. Dignity
2. Clarity
3. Boldness
4. Strength

7-5. The principal difference between old style and modern Roman types is that old style has which of the following characteristics?

1. Rounded serifs
2. FAT hairlines
3. Straight serifs
4. Heavier shadings

7-6. What is the name given to the typeface characterized by slanted letters that is made to match almost every type style in use?

1. Script
2. Gothic
3. Italics
4. Text

IN ANSWERING QUESTIONS 7-7 THROUGH 7-11, SELECT FROM THE LIST BELOW THE TYPEFACE CUSTOMARILY USED FOR THE PURPOSE STATED IN THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Roman
- B. Gothic
- C. Contemporary
- D. Script

7-7. To print the text of newspapers, books and magazines.

1. A
2. B
3. C
4. D

7-8. To print formal material, such as invitations.

1. A
2. B
3. C
4. D

7-9. To print advertisements, compositions, and TV commercials.

1. A
2. B
3. C
4. D

7-10. To print labels on cans and boxes.

1. A
2. B
3. C
4. D

7-11. To print posters and newspaper headlines.

1. A
2. B
3. C
4. D

7-12. What typeface most closely resembles handwriting?

1. Script
2. Italics
3. Gothic
4. Text

7-13. Typefaces that bear a close resemblance to each other but are not exactly alike in design are known by which of the following names?

1. Series
2. Races
3. Families
4. Fonts

7-14. What is the complete assortment of type in one size and style called?

1. Case
2. Class
3. Series
4. Font

7-15. When you use an initial letter to begin a page or a paragraph, what rule is generally followed?

1. The entire sentence is capitalized
2. The rest of the word is capitalized
3. The remainder of the word is italicized
4. The rest of the sentence is printed in boldface

7-16. When you select ornaments for a print job, what is the general rule to follow?

1. Select ornaments for decoration only
2. Abundantly decorate the job with ornaments
3. Select ornaments that contrast with the type
4. Use ornaments that correspond with the type

7-17. What is meant by the focal point of a newspaper page?

1. The name of the newspaper
2. The area where the reader normally expects to find the most important story
3. The area occupied by the largest picture
4. The most attractive area of the page

7-18. What device was used by newspaper editors of the '30s and '40s to establish the upper right-hand corner of a newspaper page as the focal point?

1. Arrows
2. Art
3. Banner headlines
4. Sub-heads

7-19. What area is most commonly used as the front-page focal point for today's newspapers?

1. Upper right-hand corner
2. Upper left-hand corner
3. Upper center
4. None

7-20. On the inside page with no advertising, where is the focal point?

1. Upper right-hand corner
2. Upper left-hand corner
3. Upper center
4. Center page

IN ANSWERING QUESTIONS 7-21 THROUGH 7-25, SELECT FROM THE LIST BELOW THE TYPE OF MAKEUP LINE CHARACTERIZED BY THE INFORMATION GIVEN AS THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Circle
- B. Diagonal
- C. Horizontal
- D. Vertical

7-21. Tends to add rhythm to a page and encourages the reader to read through the page.

1. A
2. B
3. C
4. D

7-22. Places equal importance on all stories.

1. A
2. B
3. C
4. D

7-23. Was used in makeup in early America.

1. A
2. B
3. C
4. D

7-24. Introduced in World War II and is the most striking change in newspaper appearance this century.

1. A
2. B
3. C
4. D

7-25. Used to get reader to read back and forth on page.

1. A
2. B
3. C
4. D

7-26. Which of the following design concepts is used to standardize the day-to-day appearance of a newspaper?

1. Balance
2. Unity
3. Rhythm
4. Harmony

7-27. Separating display items to give each the attention it deserves on a newspaper page is the practice of which of the following design concepts?

1. Balance
2. Contrast
3. Unity
4. Harmony

- 7-28. A paneled page is one that lacks adherence to which of the following design concepts?
1. Balance
 2. Harmony
 3. Contrast
 4. Unity
- 7-29. Which of the following elements help the reader to identify a particular newspaper?
1. Masthead, headlines and devices
 2. Nameplate, flags and devices
 3. Nameplate, masthead and flags
 4. Flags, headlines and masthead
- 7-30. Which of the following elements of the newspaper include(s) the disclaimer?
1. The flag
 2. The nameplate
 3. The masthead
 4. All of the above
- 7-31. To indicate the section pages of a newspaper, you should use which of the following newspaper makeup elements?
1. Nameplates
 2. Flags
 3. Mastheads
 4. Section logos
- 7-32. Which of the following newspaper makeup elements contribute to all of the five concepts of newspaper design?
1. Flags
 2. Mastheads
 3. Typographic devices
 4. Headlines
- 7-33. A story requiring a jump should be split in which of the following ways?
1. At the end of a paragraph
 2. At the end of a sentence not ending a paragraph only
 3. In midsentence only
 4. Either 2 or 3 above, depending on editorial preference
- 7-34. Which of the following examples represents the best use of a thumbnail photo?
1. It is positioned so that it looks into the story or out of the page and has a name line
 2. It is printed one column wide and floated in the copy above a name line
 3. It shows action or motion and is used to guide the reader's eye through a page
 4. It should give a "thumbnail sketch" of the story, and it should be at least two columns wide and placed at the end of the story
- 7-35. Which of the following techniques may be used to break up the grayness of a page?
1. Using boxes and dingbats
 2. Using pictures effectively
 3. Using a variety of type
 4. All of the above

- 7-36. Which of the following typographic devices are commonly favored by contemporary newspaper editors to separate unrelated items and to unite related items?
1. Column rules and cutoff rules
 2. End dashes and em dashes
 3. Cutoff rules and dinky dashes
- 7-37. Reefers are used to break up grayness on a page by employing which of the following typographical devices?
1. A hammerhead
 2. Dingbats
 3. A sandwich
 4. An initial letter
- 7-38. Which of the following items identifies a newspaper on each page of the publication?
1. A dateline
 2. A folio line
 3. A window
 4. A flag
- 7-39. All special pages of a newspaper should have which of following traits in common?
1. Artistic designs
 2. Individual personalities
 3. A similarity in makeup
 4. Action pictures
- 7-40. What factor determines the format to be used in laying out a picture story?
1. The importance of the story
 2. The space limitations of the publication
 3. The expressed interests of the publication's readers
 4. The number of photographs available
- 7-41. In a picture story, what picture is the most important?
1. The central picture in the body
 2. The closing picture
 3. The lead picture
- 7-42. For a picture story layout, the subject of the lead photograph should face in what direction?
1. To the viewer's right
 2. Downward
 3. Straight out of the page
 4. To the viewer's left
- 7-43. Headlines, cutlines and text in a picture story layout serve which of the following functions?
1. They provide facts to supplement the pictures editorially
 2. They serve graphically as elements of composition
 3. Both 1 and 2 above
 4. They duplicate the message in the pictures
- 7-44. What are the initial copies of your typeset stories called?
1. Galley proofs
 2. Dummies
 3. Proofs only
 4. Trays, galley proofs or proofs
- 7-45. What method of noting proofreader's marks requires the editor to draw lines to the error and place the proofreading symbol in the margin?
1. Book system
 2. Guideline system
 3. College system
 4. AP system

A.	Mans odds for survival in polar area
B.	could be
C.	greatly increased as a result of 2 recent
D.	inventions
E.	sponsored by the coast guard.
F.	The inventions include a light weather-
G.	Resistant tent,
H.	and a blanket which, when folded, will fit in
I.	the palm
J.	of the hand Both are designed to conserve
K.	body warmth.
L.	Light, portable and easily assembled, the tent
M.	is
N.	made of fabric which is windproof and water
O.	proof
P.	Yet it is porous enough to permit the escape
Q.	of body
R.	moisture while retaining the occupants body
S.	heat.
T.	The blanket is made of light, aluminized
U.	plastic film
V.	which possesses unusual toughness and
W.	durability. This
X.	type film is presently used in space
Y.	operations.
Z.	Although the blanket measures 56 by
AA.	84 in, it
AB.	be can folded into a small, rectangular
AC.	package suitable
AD.	for easy for handling.

Figure 7-A.—A galley to be proofread

FIGURE 7-A IS AN ARTICLE TO BE PROOFREAD AND EDITED. THE LETTERS PRECEDING EACH LINE ARE REFERENCES IN ANSWERING QUESTIONS 7-46 THROUGH 7-57. PROOFREAD THE ARTICLE, USING THE APPROPRIATE MARKS GIVEN IN FIGURE 8-21 OF YOUR TEXTBOOK, THEN ANSWER THE FOLLOWING QUESTIONS.

7-46. What symbol should you enter to correct the possessive cases in lines A and J?

7-47. What indication should you make to show the printer that the number in line B and the measurement in line N are to be spelled out?

7-48. Which of the following marks should you use on line C?

7-49. What mark should be used for the error in line D?

7-50. In line E, assume that you made marks to remove the commas preceding, “when folded.” However, you now decide to retain the commas. What should you write to indicate that fact?

1. Don’t change
2. Disregard
3. Stet
4. Replace commas

7-51. Which of the following marks should you use to correct the punctuation of line F?

1. 
2. 
3. 
4. 

7-52. What mark indicates that punctuation has been omitted from line G?

1. 
2. 
3. 
4. 

7-53. What mark should you use for line H to indicate that “water proof” is one word?

1. 
2. 
3. 
4. 

7-54. What mark should you use to indicate that line I continues the sentence begun on line G?

1. 
2. 
3. 
4. 

7-55. What mark should you enter to correct line M?

1. 
2. 
3. 
4. 

7-56. What symbol do you insert at line O to indicate the transposition of words?

1. 
2. 
3. 
4. 

7-57. What mark should you use to eliminate the duplicated word in line P?

1. 
2. 
3. 
4. 

ASSIGNMENT 8

Textbook Assignment: “Publications,” chapter 8—(continued), pages 8-25 through 8-30; and “Writing Headlines and Cutlines,” chapter 9, pages 9-1 through 9-13.

8-1. What is the primary reason for designing a newspaper page?

1. To decrease the time required in the makeup process
2. To make the page easier to read
3. To provide equal treatment to all major stories
4. To keep readers from becoming bored with one repetitious pattern

8-2. Which of the following patterns is representative of contemporary style magazines?

1. Formal balance
2. Focus
3. Grid
4. Quadrant

IN ANSWERING QUESTIONS 8-3 THROUGH 8-8, SELECT FROM THE LIST BELOW THE DESIGN PATTERN CHARACTERIZED BY THE STATEMENT GIVEN AS THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Focus
- B. Formal
- C. Quadrant
- D. Circus

8-3. The page is divided into quarters and a major element is placed in each quarter.

1. A
2. B
3. C
4. D

8-4. The news is made up on a diagonal line that calls the reader’s attention to the most important story on the page.

1. A
2. B
3. C
4. D

8-5. The news is presented so that all elements vie for the reader’s immediate attention.

1. A
2. B
3. C
4. D

8-6. The page is divided in half vertically.

1. A
2. B
3. C
4. D

8-7. The reader’s attention is directed to the upper corners of the page by the stair step arrangement of headlines.

1. A
2. B
3. C
4. D

8-8. This design is characterized by such elements as immense type and large art masses in unorthodox shapes.

1. A
2. B
3. C
4. D

8-9. In which of the following design patterns is the page divided in half vertically and, for each element placed on one side of the center line, a duplicate element is placed at the same point on the opposite side?

1. Dynamic balance
2. Functional
3. Formal balance
4. Modular

8-10. Which of the following designs follows no set pattern and allows the news to dictate the layout?

1. Formal balance
2. Functional
3. Horizontal
4. Dynamic balance

IN ANSWERING QUESTIONS 8-11 THROUGH 8-15, SELECT FROM THE LIST BELOW THE DESIGN PATTERN CHARACTERIZED BY THE STATEMENT GIVEN AS THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Horizontal
- B. Modular
- C. Grind
- D. Functional

8-11. Large multicolumn headlines, large horizontal pictures.

1. A
2. B
3. C

8-12. This format came about from a study that showed that readers estimate they read horizontal copy faster than vertical copy.

1. A
2. B
3. C
4. D

8-13. Intersecting lines are used to form rectangles to give a page the look of modern magazines.

1. A
2. B
3. C
4. D

8-14. Pleasing vertical and horizontal rectangles are combined and irregular story shapes are avoided.

1. A
2. B
3. C
4. D

8-15. A strong vertical chimney is the earmark of this design pattern.

1. A
2. B
3. C
4. D

8-16. Which of the following design patterns places a strong emphasis on a single story or issue?

1. Focus
2. Total
3. Functional
4. Grid

- 8-17. Around the time of the Spanish-American War, which headline form was introduced?
1. Initial letter
 2. Multi-column heads
 3. Multi-decked heads
 4. Streamlined, compact heads
- 8-18. In the modern period following World War I, what headline type came into prominence?
1. Initial letter
 2. Multicolumn heads
 3. Multi-decked heads
 4. Streamlined, compact heads
- 8-19. Which of the following pairs of adjectives best describe a good, modern headline?
1. Long and specific
 2. Brief and dramatic
 3. Long and informative
 4. Brief and informative
- 8-20. The headline "Navy to Buy Whole Town" illustrates what headline style?
1. Downstyle
 2. All caps
 3. Upper and lower head
 4. Lower head
- 8-21. A single-line headline across the top of the page is what type of headline?
1. Hammerhead
 2. Kicker
 3. Banner
 4. Readout
- 8-22. The headline "Upgrading urged for nation's railroads" illustrates what headline style?
1. Down style
 2. All caps head
 3. Upper and lower head
 4. Lower head
- 8-23. What headline style is the most difficult to read?
1. Down-style
 2. All caps head
 3. Upper and lower head
 4. Lower head
- 8-24. In a flush-left head, the lines must be of equal length.
1. True
 2. False
- 8-25. A headline that is twice the size and set flush left above the main head is known by what term?
1. Tripod
 2. Hammerhead
 3. Rocket
 4. Wicket
- 8-26. What is the composition of a tripod head?
1. A short line of larger type set flush left and above two lines of smaller type
 2. Two lines of small type to the right of a short line of larger type twice the size of the smaller type
 3. A single, short line of smaller type to the left of two lines of larger type
 4. A larger type centered above the main head of smaller type
- 8-27. What letters each equal two units in an all-cap headline?
1. M and W
 2. N and O
 3. P and Q
 4. R and S

- 8-28. In headline counting, all numerals, with one exception, equal how many units?
1. 1
 2. 2
 3. 1/2
 4. 1 1/2
- 8-29. Which of the following punctuation marks is evaluated as 1 1/2 units?
1. Exclamation mark
 2. Question mark
 3. Apostrophe
 4. Semicolon
- 8-30. In striving to write brief headlines, you often omit which of the following parts of speech?
1. The action verb
 2. Nouns used as subjects
 3. Adjectives, adverbs and articles
 4. Abbreviations
- 8-31. Which of the following is a rule for verb use in headlines?
1. Use active verbs in the past tense
 2. Use active verbs in the historical present tense
 3. Use passive verbs in the past tense
 4. Use passive verbs in the historical present tense
- 8-32. Which of the following is the rule for verb and article use in headlines?
1. Verbs may be omitted, articles may not
 2. Verbs and articles are required
 3. Verbs and articles may be omitted
 4. Verbs may be omitted; articles are always omitted
- 8-33. Which of the following headlines is written in the best style?
1. Bar S. Africa From Olympics
 2. Voters Bar S. Africa
 3. Olympic Committee Bars South Africa
 4. S. Africa is Barred From Olympic Games
- 8-34. "Young pedestrian shot in leg" is a better headline than "Injuries sustained by child" for what reason?
1. It is more specific
 2. It is more positive
 3. It includes more of the five Ws
 4. It uses more short, active words
- 8-35. Which of the five Ws can generally be omitted in the headline of a local story?
1. Where
 2. When
 3. Who and what
 4. Where and when
- 8-36. The main reason headline writers use a specialized vocabulary is the necessity for which of the following?
1. Colorful writing
 2. Brevity
 3. Clarity
 4. Originality
- 8-37. Under what circumstances may you use the abbreviation SECNAV in a headline?
1. When space constraints make it necessary
 2. When you spell out the title in the lead of the story
 3. When the press release goes to a broadcast outlet
 4. When the headline is for a Navy publication

- 8-38. What is the purpose of a photo outline?
1. To add interest to the picture
 2. To tell the complete story
 3. To add information that, together with the picture, tells the story
 4. To identify the picture elements
- 8-39. Gathering information for a cutline is similar to compiling material for what other publication element?
1. A film script
 2. An editorial cartoon
 3. A brief TV or radio announcement
 4. A news story
- 8-40. What is the rule for the length of a cutline?
1. Use one line
 2. Use one sentence
 3. Use two or three lines
 4. Use the fewest words that will convey the message clearly
- 8-41. Which of the following is a principle about the style of writing cutlines?
1. The cutline should arouse, but not satisfy, the reader's curiosity
 2. The style varies according to the type of picture and the policies of the individual publication
 3. The cutline should serve as a lead-in to an accompanying story
 4. The style is always the same for any type of picture
- 8-42. What are the major components of a cutline?
1. Lead, bridge, action and credit line
 2. Tie-back, identification, attribution and conclusion
 3. Identification, tie-in, action and background information
 4. Action, background information, credit line and identification
- 8-43. The first sentence in a good outline usually describes or names which of the following picture elements?
1. The action shown, or "what"
 2. The persons shown, or "who"
 3. The background details, or "when"
 4. The news peg, or "why"
- 8-44. You are writing a cutline for a news photo that shows a Navy plane on fire after being struck by lightning. Which of the following first sentences is the best?
1. Firefighters use foam to save
 2. Firefighters combated flames on a Navy plane struck by lightning
 3. Firefighters at Memphis Naval Air Station pumped foam on burning plane set afire by lightning
 4. Foam pumped on this Navy plane, struck by lightning, put out the fire before great damage was done
- 8-45. The "when" element in a cutline, if needed, is usually included where?
1. In the news story, not in the cutline
 2. At the end of the cutline
 3. In the second sentence of the cutline
 4. In the first sentence of the cutline
- 8-46. The amount of background information needed in a cutline is influenced by which of the following factors?
1. Who is in the picture and what is being depicted
 2. When and where the action occurred
 3. Why the picture was taken and what the story tells
 4. How and where the picture will be used

8-47. How should you use verb tenses in cutlines?

1. Use present, past and future tenses as in any writing
2. Use the present tense throughout
3. Describe the action in the present tense, and use appropriate tenses for background information
4. Use the past tense throughout

8-48. Where is the recommended position of the credit line in the cutline?

1. Preceding the action element
2. Following the action element
3. Preceding the background information
4. Following the background information

8-49. By which of the following methods of cutline typography may you heighten the impact of a picture for better display?

1. By setting the cutline in a larger typeface than the news column
2. By setting the cutline boldface in the same style and size of type as the news column
3. By using a different typeface than that in the news column
4. Each of the above

8-50. The cutline for a three-column photo is wrapped when it is set in what way?

1. As a single column stretching the full length of the photo
2. As a column of two-column width and centered under the photo
3. As two columns, each one and a half columns in width and set side by side
4. As three columns of one column width each and set side by side

ASSIGNMENT 9

Textbook Assignment: “Writing Headlines and Cutlines,” chapter 9—continued, pages 9-14 to 9-16; and “Legal Concerns, chapter 10, 10-1 through 10-16.

- 9-1. A three-column picture carries a two-column wide cutline to the right and a caption under the lefthand column. What is the caption called?
1. An underline
 2. An overline
 3. A lead-in
 4. A side catchline
- 9-2. What principle should you observe when you lay out a page containing pictures, cutlines and accompanying outlines?
1. Always run the picture and accompanying story side by side
 2. Follow tradition and place the cutline below the story
 3. Consider the picture and its cutline as one element
 4. Run the cutline beside the picture
- 9-3. You write a story and have a photo to accompany it. You learn the newspaper has space problems and can use the photo only. What, if anything, should you do?
1. Rewrite the story to shorten it
 2. Ask the layout artist to find another spot for the story and key the story and picture appropriately
 3. Rewrite the cutline to include all the essential facts
 4. Nothing
- 9-4. You are training a JO striker. He has both a picture and story material for the station newspaper. You should suggest that he begin writing which element first?
1. The story
 2. The cutline
 3. The headline
 4. The dateline
- 9-5. A dateline for a photograph is required when a picture is submitted under which of the following conditions?
1. When it's set for immediate release to a ship's newspaper
 2. When it's prepared for external release
 3. When it's accompanied by a story
 4. When it has no cutline
- 9-6. Which of the following statements is true of libel and slander?
1. Libel is spoken, slander is written
 2. Slander is spoken, libel is written
 3. Reporters are protected by libel and slander charges by the First Amendment to the U.S. Constitution
 4. Libel and slander laws are federal statutes

- 9-7. What statement best defines libel?
1. Libel is a printed lie about somebody
 2. Libel is a published defamation that unjustly holds a person up to ridicule
 3. Libel is a spoken defamation that unjustly holds a person up to ridicule
 4. Libel is a defamation that results in a sensational court case
- 9-8. For a statement to be libelous, which of the following conditions must be present?
1. The statement must have clearly identified the person in question
 2. The statement must have been published
 3. The character or property of the person in question must have been degraded
 4. Each of the above
- 9-9. For what reason does respectable news medium obey the libel laws?
1. It believes in the dignity of the individual
 2. It wishes to shun controversy
 3. It does not desire adverse criticism
 4. It does not wish to be closed by the government
- 9-10. Which of the following acts would constitute libel?
1. A newspaper's attack on an individual's personal reputation
 2. A comment regarding the political position of a candidate
 3. A review of a new movie
- 9-11. A reporter writes a story accusing a county official of taking bribes. His paper prints it, the UPI picks it up and other newspapers print it as well. The accused official sues. Who could be named as a defendant in the suit and be held liable for damages?
1. Only the reporter who wrote the story
 2. Just the newspapers that ran the story
 3. Only the original newspaper
 4. Everyone who had anything to do with the story
- 9-12. What are the two types of libel?
1. Libel per quod and defamation
 2. Libel per se and defamation
 3. Libel per quod and libel per se
 4. Libel per se and slander
- 9-13. A feature story about a presidential candidate stresses his strong affiliation with and loyalty to a particular church. It also states later in the article that the church discriminates against several ethnic groups, implying that the candidate shares those views. What term best describes the legal posture of the story?
1. Libel per se
 2. Libel per quod
 3. Uncontradicted rumor
 4. Fair comment or criticism
- 9-14. In a small town, the newspaper publisher is the brother of a prominent doctor who runs the local clinic. When a new doctor comes to town and opens an office, the newspaper publishes a story about him. The article tells of the new doctor's involvement in a malpractice suit, but fails to mention he was acquitted of the charge. What term best describes the legal posture of the story?
1. Libel per se
 2. Libel per quod
 3. Uncontradicted rumor
 4. Fair comment or criticism

- 9-15. A newspaper article states that a candidate for Congress is said to be a former member of the Ku Klux Klan. The purpose of the claim is apparently to discredit the candidate through association. The candidate states that the accusation was based on a wrong identification. If the candidate's claim is true, what term best describes the legal posture of the story?
1. Libel per se
 2. Libel per quod
 3. Uncontradicted rumor
 4. Fair comment or criticism
- 9-16. In a city crippled by a transit strike, the mayor refuses to appoint an arbitrator to consider the union's grievances. A local newspaper accuses the mayor of neglecting the public welfare. The mayor sues the paper. What term best describes the legal posture of the story?
1. Libel per se
 2. Libel per quod
 3. Uncontradicted rumor
 4. Fair comment or criticism
- 9-17. Whether words involved in a libel suit are libelous is determined by which of the following parties?
1. The courts
 2. The plaintiff
 3. The defendant
 4. The public
- 9-18. What type of libel is considered most serious and can support a lawsuit in itself?
1. Libel per se
 2. Libel per quod
 3. Civil libel
 4. Slander
- 9-19. The legal action of one individual suing a corporation for alleged defamation may result from which of the following classes of libel?
1. Seditious
 2. Obscene
 3. Civil
 4. Criminal
- 9-20. Under what condition may an individual bring a civil libel suit against the U.S. government?
1. When the government has committed seditious libel
 2. When the government admits guilt of libel
 3. When the government will not settle out of court
 4. Only when the government consents to the suit
- 9-21. Who is the accuser in a criminal libel suit?
1. The Department of Justice
 2. The state
 3. The defendant
 4. The plaintiff
- 9-22. Which of the following are partial defenses that can lessen the damages assessed against a defendant in a libel suit?
1. Retraction (or apology) and good faith (or honest mistake)
 2. Truth and retraction (or apology)
 3. Fair comment and criticism
 4. Honest mistake (or good faith) and truth

9-23. Under what circumstances can the defense of “repetition” be used?

1. When a libelous story is repeated in a subsequent edition of the same publication before the libeled party can begin legal action
2. When the libeled party has a history of committing the act reported on by the publication
3. When a publication uses a libelous story that has been printed elsewhere
4. When another publication is already charged with libel for the same story

9-24. What are two complete defenses against libel action that, if proved, will lead to acquittal?

1. Truth and honest mistake
2. Fair comment and criticism and retraction
3. Honest mistake and publishing an apology
4. Truth for a good reason and fair comment and criticism

9-25. When will even ethical reporters disregard an individual’s right to privacy?

1. When the person is noteworthy
2. When there is a compelling need to publish the information for the public good
3. When the information is not libelous
4. When they believe the information is about to be published by other newspapers

9-26. Current copyright laws in the United States are in what form?

1. State statutes
2. The Copyright Act of 1976
3. Federal copyright laws dating from 1909
4. Current international treaties that the U.S. has signed

9-27. Which of the following is NOT eligible for copyright protection?

1. Audiovisual works
2. Slogans and familiar symbols
3. Choreographed works
4. Sound recordings

9-28. Which of the following is NOT eligible for copyright protection?

1. Sculptures
2. Facts and lists taken from public documents
3. Maps photographs and drawings
4. Technical encyclopedias

9-29. Where copyright protection applies, it is available to which of the following works?

1. Published works only
2. Unpublished works only
3. Both published and unpublished works
4. Published works and original ideas

9-30. The Copyright Act of 1976 became effective on what date?

1. Jan. 1, 1976
2. Jan. 1, 1977
3. Jan. 1, 1978
4. Jan. 1, 1979

- 9-31. A journalist quoting in a newsstory an excerpt from a popular novel without permission from the copyright holder is an example of which of the following terms?
1. Copyright infringement
 2. Doctrine of fair use
 3. Compulsory license limitation
 4. Plagiarism
- 9-32. While in the course of carrying out official duties, a Navy journalist infringes on a copyright. What legal action, if any, may the copyright owner take with the federal government's permission?
1. Sue only the journalist who infringed the copyright
 2. Sue the journalist and all persons who may have edited the material containing the infringement
 3. Sue only the U.S. government
 4. None
- 9-33. Which of the following materials is NOT subject to U.S. copyright laws?
1. Books written by professors at state universities
 2. Magazine articles written by Navy journalists during off-duty time
 3. Books published by the U.S. government
 4. Books written in federal prisons by convicted felons
- 9-34. When does copyright protection for a work begin?
1. At the moment the creator notifies the Copyright Office of the form of the work
 2. At the moment the idea for the work is conceived
 3. At the time the work is create din fixed form
 4. At the time it is labeled "copyrighted" by the U.S.
- 9-35. In the case of works made for hire, who is legally considered to be the author of such works?
1. Only the actual creator of the work
 2. Only the employer who commissioned the work
 3. Only the publisher of the work
 4. Anyone designated by the publisher of the work
- 9-36. Unless there is an agreement specifying ownership, who is the rightful owner of a joint work?
1. The publisher of the work
 2. The author who supplied the largest percentage of input to the work
 3. All contributing authors of the work are co-owners
 4. The first author to file the work with the Copyright Office
- 9-37. Under the current copyright laws, who owns the copyright on a work after the transfer of any material object that embodies a protected work has taken place?
1. The person holding the copyright before the transfer occurred
 2. The person to whom the material object was transferred
 3. Both 1 and 2 above, as co-owners
 4. The U.S. Copyright Office
- 9-38. Copyright protection is available for all unpublished works, regardless of the nationality or domicile of the author.
1. True
 2. False

- 9-39. Under the new copyright laws, when is a work considered created?
1. When it is published for the first time
 2. When it is fixed in a copy or phonorecord for the first time
 3. When the basic idea for the work is first conceived
 4. When the Copyright Office acknowledges the existence of the work
- 9-40. What is the significance of a particular work bearing the year of its publication date?
1. The date is used to determine the duration of copyright protection
 2. The date is used in determining the duration of copyright protection for an anonymous work or a work made for hire
 3. The date is used in determining the duration period between the publication of a work and the date the copyright can be renewed. The date is used to indicate when a work has been deposited with the Library of Congress
- 9-41. The inclusion of a copyright notice on a work is the responsibility of which of the following parties?
1. The Registrar of the Copyright Office
 2. The copyright owner
 3. The Clerk of the Library of Congress
 4. The publishing house that prints the work
- 9-42. The letter “P” in a circle indicates what type of copyright notice?
1. Printed matter and illustrations
 2. Published works of any type
 3. Unpublished works of any type
 4. Phonorecords or sound recordings
- 9-43. Which of the following works is NOT eligible for retroactive protection under the new copyright law?
1. Works published before January 1, 1978, that did NOT carry a proper copyright notice
 2. Any work published before January 1, 1978
 3. Works published before January 1, 1978, in foreign countries
- 9-44. If the copyright notice was omitted on a work created after January 1, 1978, what action can the owner take to maintain copyright protection?
1. Exert a reasonable effort to correct the omission within five years of registration
 2. Notify the Copyright Office of the omission and request extended protection
 3. Accept the fact that nothing can be done to maintain protection on a work if it has no copyright notice affixed
- 9-45. Which of the following is NOT a benefit of registering a work with the Copyright Office?
1. It establishes a public record of the copyright
 2. It provides prima facie evidence in court to the validity of the copyright claim
 3. It is the only way to get copyright protection
 4. If made within three months of publication, lawyer’s fees and statutory damages are available to the owner if the copyright is infringed upon

9-46. You have written a book about your experiences as a Navy journalist. What is the duration of the copyright protection for your work?

1. For 28 years from the date of first publication
2. From the moment of first publication and enduring for 50 years after your death
3. From the moment the work is created to 50 years after your death
4. For 75 years from publication or 100 years from creation, whichever is shorter

9-47. In the case of a joint work prepared by two or more authors who did not work for hire, what is the duration of copyright protection?

1. From the work's creation to the death of the last surviving author
2. From the first publication of the work to 50 years after the death of the last surviving author
3. From the work's first publication to 50 years after the death of the first author
4. From the work's creation to 50 years after the death of the last surviving author

9-48. For a work copyrighted before January 1, 1978, whose copyright is still in effect, what copyright renewal term is available?

1. 28 years
2. 47 years
3. The life of the present copyright owner
4. The life of the author plus 50 years

9-49. When a work has been registered in unpublished form, a second registration is unnecessary when the work is published.

1. True
2. False

9-50. During the registration process, how many copies should be deposited for a work published before January 1, 1978?

1. One copy as first published
2. One copy of the best edition
3. Two copies as first published
4. Two copies of the best edition

9-51. Which of the following is NOT a reason the concept of publication is important in copyright laws?

1. Works that are published must be deposited with the Library of Congress
2. The date of publication affects the copyright duration for anonymous or pseudonymous works
3. Publication is required for registration
4. Deposit requirements for registration differ based on publication

ASSIGNMENT 10

Textbook Assignment: “Basic Photography,” pages 11-1 through 11-27; and “Basic Photojournalism,” chapter 12, pages 12-1 through 12-4.

- 10-1. What are the two man-made essentials for taking a picture?
1. A camera and a light source
 2. A film and a camera
 3. A light and a film
 4. A film and a lens
- 10-2. Modern photographic film is made by using an emulsion to coat which of the following substances?
1. Glass
 2. Paper
 3. Cellulose or polymer plastic
 4. Sheet gelatin
- 10-3. Which of the following groups of components is essential to a camera?
1. A light-tight box, an exposure calculator and an image support
 2. An optical system, an image support and a view finder
 3. An image support, a light-tight box and an optical system
 4. A focusing device, a light-tight box and an optical system
- 10-4. After exposure but before development, the image on the film is known by what terminology?
1. Latent image
 2. Exposed image
 3. Halide image
 4. Monochromatic image
- 10-5. The design of the SLR allows the accomplishment of which of the following functions?
1. Judging the depth of field at a selected aperture
 2. Rapid film changing
 3. Speedy camera settings
 4. All of the above
- 10-6. Which of the following features is NOT common to modern SLR cameras?
1. Built-in, through the lens exposure meter
 2. Interchangeable lenses with sophisticated leaf shutters
 3. Focal plane shutters
 4. Interchangeable lenses with iris diaphragm
- 10-7. When you focus a camera, what is actually happening mechanically within the camera?
1. The lens is moving closer or farther from the focal plane
 2. The aperture is changing
 3. The mirror is moving closer or farther from the focal plane
 4. The focal plane angle is changing

- 10-8. How should you remove a smudge from a camera lens?
1. With any tissue only
 2. With a lens-cleaning tissue soaked with lens-cleaning solution
 3. With a lens-cleaning tissue moistened with one or two drops of lens-cleaning solution
 4. Any soft, dry cloth

- 10-9. How can you determine if a scratch on the lens is bad enough to require its replacement?
1. Any scratch will require replacement
 2. Focus the camera on an object, and check for obscured or blurred areas
 3. Give the lens to a local photo lab for a prism test
 4. Give the lens to your supervisor for his or her determination

- 10-10. What material(s) should be used to clean a camera body?
1. A soft tissue and cleaning fluid
 2. Cotton swab and water
 3. Silicon cloth or soft chamois
 4. Soft cloth and isopropyl alcohol

- 10-11. All photographic equipment used in picture making, other than cameras and lenses, is referred to by what terminology?
1. Photographic aids
 2. Camera accessories
 3. Non-optic material
 4. Camera bag items

IN ANSWERING QUESTIONS 10-12 THROUGH 10-14, SELECT FROM THE LIST BELOW THE PHRASE THAT DESCRIBES OR APPLIES TO THE EQUIPMENT LISTED IN COLUMN A. NOT ALL RESPONSES ARE USED.

- A. Glass optical element dyed to absorb colors selectively.
- B. Shades used to keep sunlight from striking the front of a lens.
- C. Devices used to increase light efficiency.
- D. Device that automatically advances exposed film.

10-12. Motor drives.

1. A
2. B
3. C
4. D

10-13. Filters.

1. A
2. B
3. C
4. D

10-14. Lens hoods.

1. A
2. B
3. C
4. D

10-15. The type of lighting you should use to bring out texture and provide depth to the subject is known by what terminology?

1. Frontlight
2. Backlight
3. Light from directly above or below
4. Sidelight

10-16. A photojournalist often uses electronic flash for which of the following purposes?

1. To fill in shadow areas
2. To stop a subject's motion
3. To increase illumination
4. All of the above

10-17. Which of the following is NOT a primary color?

1. Red
2. Blue
3. Green
4. Cyan

10-18. You are taking a black and white picture of a blonde child standing on a green lawn. She is wearing a pale yellow dress. You can make a more natural looking photo and make the yellows and greens a darker gray by using what type of filter?

1. Blue
2. Yellow
3. Green
4. Red

10-19. You want to photograph an old map that has the important boundaries drawn with red ink. The marks are rather faint in color, so to darken them, you use a filter in what complimentary color?

1. Yellow
2. Red
3. Cyan
4. Magenta

10-20. The filter factor, that affects the amount of exposure needed, depends partly on which of the following factors?

1. The color of the filter
2. The latitude of the film
3. The intensity of the light source
4. The aperture setting on the camera

10-21. You are using a light red filter with a factor of 8.0 in daylight. The exposure should be increased by, (a) how much, (b) how many stops?

1. (a) 2 times; (b) 2 stops
2. (a) 4 times; (b) 3 stops
3. (a) 8 times; (b) 3 stops
4. (a) 8 times; (b) 4 stops

10-22. What term denotes the amount of light that acts upon a photographic film?

1. Intensity
2. Sensitivity
3. Reflection
4. Exposure

10-23. What technical error is responsible for ruining more photographs than any other?

1. Wrong filter selection
2. Incorrect exposure
3. Improperly operating flash equipment
4. Wrong film selection

10-24. Which of the following terms expresses the formula for exposure?

1. Intensity x time
2. Sensitivity x time
3. Intensity x film speed
4. Time divided by intensity

10-25. All of the following are factors that govern correct film exposure time EXCEPT for which one?

1. The size of the lens opening
2. The shutter speed
3. The intensity and nature of the light
4. The sensitivity of the film

10-26. What term defines the range between the minimum and maximum satisfactory exposures of film?

1. Block
2. Sensitivity
3. Latitude
4. Intensity

10-27. Film speed is a measure of what film characteristic?

1. Maximum development time
2. Sensitivity to color
3. Sensitivity to light
4. Minimum development time

10-28. What designation is given the universal expression for uniform film-speed standards?

1. USS
2. UEV
3. ISO
4. DIN

10-29. What type of color film is identified by the suffix "color"?

1. Slide film
2. Print film
3. Reproduction paper
4. Transparencies

10-30. Which of the following f/numbers is NOT a major step?

1. f/1.4
2. f/2.8
3. f/4.5
4. f/5.6

10-31. Which of the following f/stops allows the least amount of light to reach the film?

1. f/5.6
2. f/8
3. f/22
4. f/45

10-32. Increasing the diaphragm control one full stop requires doubling the time of exposure. What effect does that setting change have on the aperture opening and the exposure?

1. It increases the aperture opening and doubles the exposure
2. It decreases the aperture opening and halves the exposure
3. It decreases the aperture opening but does not change the exposure
4. It increases the aperture opening but does not change the exposure

10-33. To stop movement or action in a picture, you should consider all EXCEPT which of the following details?

1. The relative movement of the subject
2. The subject's direction of movement
3. The camera-to-subject distance
4. The depth of field

10-34. Depth of field depends on all EXCEPT which of the following factors?

1. The focal length of the lens
2. The lens aperture
3. The distance focused on
4. The sensitivity of the film

10-35. With a given camera and lens system, what factor affecting the depth of field can NOT be changed by the camera person?

1. The lens opening
2. The focus distance
3. The focal length of the lens

IN ANSWERING QUESTIONS 10-36 THROUGH 10-41, ASSUME THAT THE SUBJECT IS 25 FEET FROM THE CAMERA AND IS MOVING IN THE DIRECTION AS DESCRIBED IN FIGURE 11-21 OF THE TEXTBOOK. SELECT THE RESPONSE OF THE MINIMUM SHUTTER SPEED SETTING FOR EACH ACTION USED AS THE QUESTION.

10-36. A base runner in a baseball game running at right angles to the line of sight of the camera.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-37. A boy riding a bicycle toward you at about 8 miles per hour.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-38. A horse galloping toward you in a diagonal direction.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-39. An automobile accelerating in front of and away from you at about 35 miles per hour.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-40. A football play taken at right angles to the motion.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-41. A motor boat moving away from you in a diagonal direction at about 8 miles per hour.

1. 1/125 sec
2. 1/250 sec
3. 1/500 sec
4. 1/1000 sec

10-42. Which of the following data is NOT required on a Navy photo job order?

1. Number of views needed
2. Description of the job to be photographed
3. Type of film to use
4. Size and finish of prints

10-43. A system that allows you to take and store photos electronically is known by what terminology?

1. PC compatible
2. Digital imagery
3. Still video photography

10-44. Using your computer, you can send a digital photograph to all EXCEPT which of the following outlets?

1. Another computer via modem
2. A hard drive for storage
3. A printer for a print
4. A darkroom for further processing

10-45. Which of the following is a disadvantage of using a still digital camera?

1. The image cannot be cropped
2. The camera needs up to eight seconds between shots
3. The photos are black and white only
4. You must download photos when the memory is full

10-46. Photojournalists normally communicate by which of the following methods?

1. Photographs only
2. Carefully worded copy only
3. A harmonious combination of photographs and words
4. One dynamic photograph that portrays the essence of a news story

10-47. What is the primary objective of a photojournalist?

1. To write interesting captions that adequately describes the photographs
2. To communicate primarily through well-written copy
3. To tell the Navy story in whatever form that best suits a given event or situation
4. To communicate primarily through photographs

IN ANSWERING QUESTIONS 10-48 THROUGH 10-50, SELECT FROM THE LIST BELOW THE HISTORICAL PERIOD IN WHICH PHOTOJOURNALISM WAS USED AS DESCRIBED IN THE QUESTION. NOT ALL RESPONSES ARE USED.

- A. Spanish American War
- B. Civil War
- C. World War II
- D. Korean

10-48. Professional photographers used to record war as history and to present realistic scenes designed to shock.

1. A
2. B
3. C
4. D

10-49. Progress in producing film, more rapid transportation and photoengraving.

1. A
2. B
3. C
4. D

10-50. Photojournalists sought to interpret the war by concentrating on individuals.

1. A
2. B
3. C
4. D

ASSIGNMENT 11

Textbook Assignment: “Basic Photojournalism,” chapter 12, pages 12-5 through 12-26, and “Broadcast Writing and Radio Operations,” chapter 13, pages 13-1 through 13-9.

11-1. News photographs should NOT be used to accomplish which of the following objectives?

1. Supplement feature stories
2. Support headlines and spot news stories
3. Present a different idea to each person who sees the photograph
4. Act as independent stories when accompanied by a cutline

11-2. Almost all press photography is classified into what two categories?

1. Movies and stills
2. Spot news and features
3. Advance news and spot news
4. Hometown news and spot news

11-3. The spot news photo differs from a feature photo in that the spot news photo is affected by what other factor?

1. It is unrehearsed
2. It requires extensive planning
3. It permits the photographer to use lighting to establish a desired mood
4. It requires selection and posing of the subject for an effective shot

11-4. When you plan photographic coverage of a news event, which of the following goal(s) should you attempt to achieve?

1. Creative impressions through the use of people
2. Pictures that tell a story within themselves, when necessary
3. Simplicity and the human element
4. All of the above

11-5. Which of the following is NOT an effective technique in planning pictorial coverage of a news event?

1. Preparing outlines and identification for personnel who you plan to photograph
2. Planning the inclusion of real or implied action in the shot
3. Preparing a complete shooting schedule and sticking to it
4. Planning your shots to show only emotions or attitudes appropriate to the event

11-6. The reason(s) a planned photo feature will interest a particular audience should be listed in which of the following part of a photojournalist's shooting script?

1. First part only
2. Second part only
3. Third part only
4. Anywhere, depending on your preference

**IN ANSWERING QUESTIONS 11-7
THROUGH 11-9, SELECT FROM THE LIST
BELOW THE TECHNIQUE OF GOOD
SCRIPT SHOOTING THAT IS BEST
DESCRIBED BY THE DEFINITION GIVEN AS
THE QUESTION. NOT ALL RESPONSES ARE
USED.**

- A. Closeup
- B. Long shot
- C. Medium shot
- D. Natural shot

11-7. A shot that is the same as the eye receives.

- 1. A
- 2. B
- 3. C
- 4. D

11-8. A shot that shows greater detail than the eye receives.

- 1. A
- 2. B
- 3. C
- 4. D

11-9. A shot that shows the subject in its entirety and relates it to its surroundings

- 1. A
- 2. B
- 3. C
- 4. D

11-10. In a picture story layout, the lead picture can be identified by which of the following factors?

- 1. It's the first picture in the sequence
- 2. It's the picture that contains the essence of the story
- 3. It's referred to directly in the cutline

11-11. Assume that you are assigned to furnish regular photo coverage for the public affairs office. To be ready for this duty at all times, you should perform all except which of the following actions?

- 1. Have a camera and accessories assigned for your exclusive use
- 2. Clean and test your equipment regularly
- 3. Keep your equipment assembled in one place
- 4. All the above

11-12. Of the following attributes, which is the most difficult and important for a good news photographer to cultivate?

- 1. Mastering the mechanics of photography
- 2. Developing an inquisitive nature
- 3. Gaining a self-confident attitude
- 4. Learning to work with sureness, deftness and thoroughness

11-13. When shooting good composition, you should give primary consideration to what element?

- 1. Creating the illusion of depth to the scene
- 2. Selecting the lighting conditions
- 3. Properly placing the subject within the area of the photo
- 4. Selecting the proper supporting elements of the main subject

11-14. To keep composition simple while maintaining interest, you should use which of the following procedures?

1. Include several objects of equal interest
2. Include as many lines and shapes as possible
3. Use numerous objects scattered at random
4. Use a single object with less conspicuous supporting elements

11-15. By portraying supporting elements in a simple composition, you achieve what objective?

1. Accentuate the main idea of the photograph
2. Separate the subject into several interesting ideas
3. Eliminate empty spaces in the photograph
4. Eliminate the need of taking more than one shot of the scene

11-16. Assume that you are assigned to photograph the Naval station's new swimming pool to accompany a story about it in a local newspaper. Which of the following details is most likely to detract from the intended point of interest?

1. A number of spectators around the pool watching the water activities
2. The lines of the sidewalks in the recreation area tend to point toward the pool
3. The bright reflection on the water is in sharp contrast to the dark trees in the background

11-17. Where may the point of interest be located when you apply the rule of thirds?

1. In any one of the nine areas formed by the vertical and horizontal lines
2. In only the center area formed by the vertical and horizontal lines
3. In any of the three areas formed between the two horizontal and vertical lines
4. At any one of the intersections formed by the horizontal and vertical lines

11-18. Which of the following scenes describes the best use of a leading line?

1. A winding path beginning in the center foreground and leading to a cottage, the intended point of interest, at the top center of the picture
2. A waterfall, the point of interest, in the upper left of the picture produces a small stream flowing diagonally to the lower right foreground
3. A street beginning in the lower left corner of the scene leads to the point of interest, a mansion, in the upper right corner. The street has two intersections and several parked cars.
4. A narrow river flows from the upper left of the picture to the lower right. An old grist mill, the intended point of interest, is situated on the bank of the river in the upper one-third of the scene

- 11-19. To suggest the great height of a building effectively, you should use which of the following techniques?
1. Tilt the camera upward from a low angle
 2. Take a downward shot from a taller building
 3. Include a nearby tree for a framing effect
 4. Take an eye-level shot at sunrise or sunset so the light is coming from a low angle

IN ANSWERING QUESTIONS 11-20 THROUGH 11-24, SELECT FROM THE LIST BELOW THE COMPOSITIONAL LINE THAT ACHIEVES THE EFFECT GIVEN IN THE QUESTION. MAY BE USED MORE THAN ONCE.

- A. Curved
- B. Diagonal
- C. Horizontal
- D. Vertical

11-20. Action.

1. A
2. B
3. C
4. D

11-21. Dignity.

1. A
2. B
3. C
4. D

11-22. Beauty.

1. A
2. B
3. C
4. D

11-23. Tranquility.

1. A
2. B
3. C
4. D

11-24. Strength.

1. A
2. B
3. C
4. D

11-25. The term “weight” in the discussion of a balanced composition has what meaning?

1. The relative size of an object
2. The amount of light reflected by the object
3. The object’s size, shape, tone and location
4. The actual weight of an object in relation to a standard weight

11-26. What is the most critical factor in good action photography?

1. Timing
2. Perspective
3. Composition
4. Tone

IN ANSWERING QUESTIONS 11-27 THROUGH 11-31, SELECT FROM THE LIST BELOW THE TYPE OF PICTURE STORY USED FOR THE EXAMPLE GIVEN AS THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Pure picture
- B. Photo text combination
- C. Picture story within text story
- D. Illustrated text

- 11-27. Pictures that tell the main story supplemented with some related information.
- 1. A
 - 2. B
 - 3. C
 - 4. D
- 11-28. A series of pictures selected to stand alone in telling a story.
- 1. A
 - 2. B
 - 3. C
 - 4. D
- 11-29. Pictures of Navy scenes chosen to give a nautical effect to a brochure.
- 1. A
 - 2. B
 - 3. C
 - 4. D
- 11-30. Pictures selected to tell a complete story and used with a text that presents a separate but related story.
- 1. A
 - 2. B
 - 3. C
 - 4. D

- 11-31. Pictures chosen to attract attention and introduce a story.
- 1. A
 - 2. B
 - 3. C
 - 4. D
- 11-32. What type of picture story is the most difficult to develop?
- 1. Picture-text combination
 - 2. Pure picture story
 - 3. Picture story within text
 - 4. Illustrated text
- 11-33. What are the two approaches that a photojournalist may apply to a subject?
- 1. Perspective and subjective
 - 2. Subjective and objective
 - 3. Objective and perspective
 - 4. Subjective and interpretive
- 11-34. Photojournalists attempt to portray their feelings of the subject to the viewer by what approach?
- 1. Interpretive
 - 2. Objective
 - 3. Subjective
 - 4. Perspective
- 11-35. In general, you should NOT take informal portraits of subjects in which of the following locations?
- 1. Their work areas
 - 2. A studio
 - 3. Their homes
 - 4. In recreational areas

- 11-36. What parts of the subject are important in the informal portrait?
1. The hands and face
 2. The shoulders and head
 3. The chin and mouth
 4. The mouth and eyes
- 1-37. Which of the following is NOT a technical requirement of a good news photograph?
1. Important details well lighted and emphasized
 2. Good composition consisting of leading lines and based on the rule of thirds
 3. Enough contrast so important halftones will not be lost in reproduction
 4. Sharp focus on the main points of interest
- 11-38. Which of the following groups of words lists the elements of radio writing?
1. Music, conflict and voice
 2. Sound, music and voice
 3. Conflict, sound and voice
 4. Conflict, music and voice
- 11-39. What is the most important element of radio writing?
1. Sound
 2. Conflict
 3. Voice
 4. Music
- 11-40. According to radio writers, the backbone of interest in writing is which of the following techniques?
1. Pacing and timing
 2. Aural sense appeal
 3. Conflict
 4. Rapid getaway
- 11-41. Broadcast copy with all unnecessary words trimmed away is writing that adheres to which of the following principles?
1. Clarity
 2. Conciseness
 3. Correctness
 4. Conversation
- 11-42. The hallmark of broadcast journalism as a writing art is that copy must have what element?
1. Color
 2. Conversational tone
 3. Accuracy
 4. Interest
- 11-43. Which of the following statements is NOT a broadcast writing rule concerning abbreviations?
1. Who
 2. What
 3. When
 4. Why
- 11-44. In introducing the name of an individual into a news story, which of the following examples indicates the recommended style of use?
1. John Smith, city councilman
 2. The Honorable Joseph Sims, Mayor of Fort Worth
 3. Baseball great Joe DiMaggio
 4. Caspar Weinberger, Secretary of Defense

- 11-45. Which of the following statements is a recommended rule for broadcast writing?
1. Ignore colorful words in hard news copy
 2. Use a person's middle initial, when available, in all copy
 3. Use contractions whenever possible
 4. Use numbers whenever possible at the beginning of a lead to catch listener interest
- 11-46. Which of the following statements is NOT a broadcast writing rule concerning abbreviations?
1. Avoid starting a sentence with an abbreviation
 2. When in doubt about using an abbreviation, write it out
 3. The use of abbreviations for most military installations is permissible
 4. Never abbreviate the names of states
- 11-47. "She sells seashells by the seashore" is an example of which of the following grammatical terms?
1. Alliteration only
 2. Sibilants only
 3. Both alliteration and sibilants
 4. Homonyms
- 11-48. A fund drive netted \$10,421.10. How should that amount appear when included in a radio news release on the drive?
1. \$10,000
 2. \$10,421.10
 3. 10-Thousand-400 Dollars
 4. Ten Thousand, Four Hundred Dollars
- 11-49. What verb tense is the most effective for broadcast news?
1. Present tense only
 2. Past tense only
 3. Future tense only
 4. The one most natural to a given situation
- 11-50. Which of the following sentences is written in the active voice?
1. The speech was delivered by Dr. Smith
 2. The speech will be delivered by Dr. Smith
 3. Dr. Smith delivered the speech
- 11-51. As a general rule of thumb, you should keep broadcast copy sentences within a maximum length of how many words?
1. 14
 2. 20
 3. 25
 4. 40
- 11-52. Which of the following styles is best for most radio writing?
1. Formal
 2. Forceful
 3. Conversational
 4. Impersonal
- 11-53. Broadcast copy is constructed to allow for easy editing by deleting sentences from the bottom up.
1. True
 2. False
- 11-54. Question and quotation leads should be avoided in hard news stories.
1. True
 2. False

11-55. What primary factor governs the length of most radio news stories?

1. Contents
2. Time
3. Announcer discretion
4. Commercial value

ASSIGNMENT 12

Textbook Assignment: “Broadcast Writing and Radio Operations,” chapter 13, pages 13-9 to 13-30; “Television,” chapter 14, pages 14-1 to 14-29; and “Radio and Television Interviewing,” chapter 15, 15-1 through 15-8.

12-1. Radio listeners should be alerted to quoted material in the body of a news story by the use of the word “quote” preceding the remarks and the word “unquote” following the statement.

1. True
2. False

12-2. For which of the following reasons is the hyphen used in broadcast copy?

1. To help announcers phrase difficult words
2. To instruct announcers to pronounce individual elements of a word distinctly
3. Both 1 and 2 above
4. To tell announcers to pause a bit longer than at a corona

12-3. The body of the broadcast news story should be developed in which of the following patterns?

1. Chronological, descending importance or expanding the five Ws
2. Upright pyramid, ascending importance or expanding the five Us
3. Chronological, inverted pyramid or suspense building
4. Upright pyramid, inverted pyramid or ascending importance

12-4. In writing the body of a broadcast story, which of the following rules apply?

1. Repeat all names used in the lead
2. Give complete identification of persons named in the lead
3. Save one or more of the important facts for a punch close
4. Present the most important facts first

IN ANSWERING QUESTIONS 12-5 THROUGH 12-6, SELECT FROM THE LIST BELOW THE PUNCTUATION MARK THAT SERVES THE FUNCTION DESCRIBED IN THE QUESTION. NOT ALL RESPONSES ARE USED.

- A. Comma
- B. Dash
- C. Parentheses
- D. Hyphen

12-5. Indicates a pause shorter than that of a period.

1. A
2. B
3. C
4. D

12-6. Sets off information for an announcer that is not to be read aloud.

1. A
2. B
3. C
4. D

- 12-7. When you type broadcast copy, your typewriter margin should be set for an average of how many spaces per line?
1. 30
 2. 45
 3. 60
 4. 75
- 12-8. When broadcast copy is prepared correctly, approximately how many lines of type equal 30 seconds of reading time by an average announcer?
1. 2 to 4
 2. 7 to 8
 3. 11 to 12
 4. 14 to 16
- 12-9. Approximately how many words make up a 60-second story read by an average announcer?
1. 50
 2. 100
 3. 150
 4. 200
- 12-10. Besides the slugline and the type of release submitted, what information should be contained in the four-unit heading of a broadcast script?
1. Name of writer and telephone number
 2. Date the copy is written and the length of the copy
 3. Brief summary and length of the copy
 4. Length of the copy and the date the copy is to be released
- 12-11. Which of the following practices applies to in-house broadcast copy?
1. Copy should be absolutely clean
 2. The same copy-editing marks as those used by the print media are used by broadcasters
 3. Broadcast editing methods are used
 4. No special concern is paid to the appearance of broadcast copy
- 12-12. What are the forms of spot announcements?
1. Selling and appeal
 2. Information and selling
 3. Attention and information
 4. Information and action
- 12-13. Which of the following elements describe the three-pronged approach to structuring a selling spot announcement?
1. Research, target and delivery
 2. Attention, audience and activity
 3. Estimate, energize and execute
 4. Attention, appeal and action
- 12-14. What important step in a selling spot is unnecessary in an information spot?
1. The attention-getting step
 2. The audience-targeting step
 3. The call for audience action step
 4. The audience research step

A.	Armed Forces Day is scheduled for May 13 and 14.
B.	Exciting exhibits and demonstrations will be held at Naval Air Station North Island.
C.	Admission is free.
D.	The program begins on Saturday the 14th at 1245.
E.	This is a chance to get a first-hand look at over a thousand exhibits of our latest military equipment, including our newest missile and supersonic aircraft.
F.	Ample free parking is available for 25,000 vehicles.
G.	Additionally, there will be aerial demonstrations by the Armed Forces; acrobatic flying by the Navy's Blue Angels and the Air Force's Thunderbirds; a simulated attack on an enemy position by Army Ranger units; plus a demonstration of Marine Corps invasion techniques using helicopters.

Figure 12-A

IN ANSWERING QUESTIONS 12-15 THROUGH 12-18, REFER TO FIGURE 12-A AND THE FOLLOWING INFORMATION.

In a telephone interview with the Chairman of the Armed Forces Day program for your area, you obtained the information in figure 12-A above. Your PAO wants you to write a spot announcement on the program for broadcast over local commercial radio stations.

- 12-15. Which of the following examples of sentence F is the preferred form for radio spot announcements?
1. The base has available parking facilities for an estimated 25,000 vehicles
 2. Ample free parking is available for 25 thousand vehicles
 3. Ample free parking is available for twenty-five thousand cars
 4. Parking facilities for 25 thousand cars is available, according to the Chairman of the Armed Forces Day Committee
- 12-16. What changes should you make to sentence D for the spot announcement?
1. Spell out the numerals for the date "14th"
 2. Spell out the numerals for the hours only
 3. Spell out the numerals for the dates and hours
 4. Use "12:45 p.m." instead of "1245."
- 12-17. What changes should you make in sentence G?
1. Rewrite it in several short sentences
 2. Add more details
 3. Simplify the vocabulary used
 4. Shorten it
- 12-18. What is the best way for you to rephrase the information in line B so the sentence is in spot announcement style?
1. The public is invited
 2. Everyone is invited
 3. You're invited
 4. All of you are invited

- 12-19. In which part of a spot announcement would you put the following sentence: “Navy fighter planes and Army Rangers are invading NAS North Island”?
1. At the beginning
 2. Immediately after the beginning
 3. In the body of the message
 4. After the message
- 12-20. Assume that you are preparing radio copy for a 30-second recruiting spot that will include 10 seconds of “Anchors Aweigh” music. You should limit your copy to approximately how many words?
1. 50
 2. 75
 3. 100
 4. 150
- 12-21. How should you indicate to the radio station that a spot announcement should not be used indefinitely?
1. Attach a note to the copy saying new material will be furnished every two weeks
 2. Include a cut-off time and “kill date” with the spot
 3. When you hand the radio copy to the news manager, tell him when you will replace it
 4. When you telephone the spot to the station, tell the announcer how many times it may be read
- 12-22. In marking broadcast copy, the single slash mark (/) tells you to do which of the following actions?
1. Make a full stop and take a big breath
 2. Pause and take a short breath
 3. Pause for emphasis, take no breath
 4. Read the next passage carefully due to tricky pronunciation
- 12-23. Which of the following types of production music is used to set the mood for the production?
1. Fill
 2. Background
 3. Theme
 4. Bridge
- 12-24. Which control on the audio console should NEVER be adjusted by studio announcers?
1. AFRTS/Network selector button
 2. Output selector button
 3. Audition/Program master gain control
 4. Monitor selection switch
- 12-25. In which of the following production phases should you review the script for unfamiliar words or names?
1. Preproduction
 2. Production
 3. Postproduction
- 12-26. Which of the following types of special effects adds depth to sounds and is used to enhance the voice?
1. Filtering
 2. Equalization
 3. Reverb
 4. Phasing
- 12-27. Which of the following components is the heart of the TV system?
1. Control room
 2. CCU
 3. Camera
 4. VCR

- 12-28. What causes “snow” on a TV picture?
1. Too little light on the subject
 2. A camera that needs adjusting
 3. A CCU out of sync with the camera it is mated with
 4. Low signal strength on the cable

IN ANSWERING QUESTIONS 12-29 THROUGH 12-31, SELECT FROM THE LIST BELOW THE TYPE OF TV AREA THAT MATCHES THE DESCRIPTION IN THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Essential area
- B. Aspect ratio
- C. Scanning area

- 12-29. All of the area seen by the television camera.

1. A
2. B
3. C

- 12-30. Area seen by the TV viewer.

1. A
2. B
3. C

- 12-31. Handling area that provides protection for a picture or other artwork if dropped.

1. A
2. B
3. C

- 12-32. Which, if any, of the following areas of limitation are required by each television visual?

1. Scanning and border
2. Essential and scanning
3. Aspect ratio
4. None of the above

- 12-33. The aspect ratio of television cameras and television receivers means they are designed in which of the following shapes?

1. Three units wide to three units high
2. Three units high to four units wide
3. Four units high to four units wide
4. Four units high to three units wide

- 12-34. The portion of a picture seen by a television camera that does not appear on television receivers is known by what term?

1. Transmission loss
2. Overscan
3. Essential area
4. Vertical filter

- 12-35. Visual for television should be designed using which of the following elements?
1. Simplicity
 2. Format
 3. Action
 4. Brevity
- 12-36. Which of the following color backgrounds for television visuals causes glitter and flare during camera movement?
1. Blue
 2. Black
 3. Green
 4. White
- 12-37. The brightest area of a television visual is usually no more than how many times as bright as the darkest area?
1. 10 times
 2. 15 times
 3. 20 times
 4. 25 times
- 12-38. Which of the following visual effects creates color vibrations that disrupt the picture?
1. Blocks
 2. Stripes
 3. Single color backgrounds
 4. Horizontal lines
- 12-39. Lettering for television visuals should be kept to what number of lines?
1. 3 or 4
 2. 5 or 6
 3. 7 or 8
 4. 9 or 10
- 12-40. Which of the following television studio production microphones picks up sound in all directions?
1. Omnidirectional
 2. Bidirectional
 3. Unidirectional
- 12-41. Where should a studio boom microphone be placed on a studio set?
1. Above and behind the sound source
 2. Above and top of the side of the sound source
 3. Above and directly over the sound source
 4. Above and directly in front of the sound source
- 12-42. What type of studio microphone is most valuable for audience participation programs?
1. Boom
 2. Hand-held
 3. Lavalier
 4. Desk
- 12-43. Radio frequency (RF) interference could cause audio problems for what type of microphone?
1. Hand-held
 2. Wireless
 3. Lavalier
 4. Boom
- 12-44. What portion of the television screen does studio lighting affect the most?
1. Color separation
 2. Shadows
 3. Illumination
 4. Camera impulses

12-45. Color temperatures of studio lighting is measured in what standard degree style?

1. Contrast
2. Impulse
3. Kelvin
4. Heat

12-46. What is the main studio light for a production set using three-point lighting?

1. Fill
2. Base
3. Back
4. Key

12-47. Which of the following elements is the only true means by which a viewer can adjust the colors on their TV screens?

1. Contrast
2. Brightness
3. Skin tones
4. Shadows

12-48. Portable light kits for ENG work should include all **EXCEPT** which of the following items?

1. Tripods
2. Battery packs
3. Scrims
4. Color scales

12-49. Television sets are normally designed based on which of the following principles?

1. The number of television productions that use the set
2. The number of people on the set
3. The size limitations of the studio
4. The number of cameras to be used in the production

12-50. What type of television set uses abstract shapes or textures to create character or mood?

1. Natural
2. Realistic
3. Futuristic
4. Fantasy

12-51. Television studio camera shots are classified by all **EXCEPT** which of the following terms?

1. ELS
2. MCU
3. ECU
4. BCM

12-52. Movement in front of the camera, usually by the talent, is referred to as what type of movement?

1. Primary movement
2. Secondary movement
3. Tertiary movement

- 12-53. What camera movement will provide the viewer with a high or low perspective of the subject?
1. Pan
 2. Dolly
 3. Pedestal
 4. Tilt
- 12-54. If the ship's homecoming calls for several shooting script closeup shots of persons waiting on the pier and long shots of the ship maneuvering to its berth, how will the close-ups most likely be used in the finished product?
1. As cut-ins
 2. As cutaways
 3. As compilations
 4. As cut-ups
- 12-55. A series of shots shows a Sailor on one of the ships searching the crowd for familiar faces, then waving and finally running down the bow to greet his family. If these scenes were interspersed with shots of his family responding to his wave, then moving closer to the bow as he approached, this method used by the film or video editor would be an example of which of the following transitional devices?
1. Cutaway
 2. Cut-in
 3. Both 1 and 2 above
 4. Crosscutting
- 12-56. When writing the script to accompany a taped or filmed news release, you should observe which of the following practices?
1. Use the pictures to supplement the narration
 2. Let the narration supplement the picture
 3. Never include in the narration details that are presented by the picture
 4. Never include in the narration details not presented by the picture
- 12-57. Which of the following television production personnel is responsible for the special effects bank?
1. Director
 2. Floor manager
 3. Audio switcher
 4. Video switcher
- 12-58. Which of the following television production personnel acts as a liaison between the director and the talent?
1. Floor manager
 2. Camera operator
 3. Audio switcher
 4. Video switcher
- 12-59. What floor manager's hand signal is used to tell the talent to wrap it up?
1. Arm and hand rotating above the head
 2. The letter T formed with both hands
 3. A grabbing motion ending in a fist
 4. Hand across the throat in a slashing motion

ASSIGNMENT 13

Textbook Assignment: “Public Affairs Office Operations,” chapter 16, pages 16-1 through 16-21; and “Home Town News,” chapter 17, pages 17-1 through 17-12.

- 13-1. All **EXCEPT** which of the following are departments within a public affairs office?
1. Media relations
 2. Internal relations
 3. Community relations
 4. Administration
- 13-2. What office or individual is not really responsible for writing command or flag officer’s biographies?
1. Administration office
 2. Public affairs office
 3. The flag officer concerned
 4. The flag secretary
- 13-3. What public affairs file contains information about local military beat reporters?
1. Command
 2. Media relations
 3. Community relations
 4. Future
- 13-4. What public affairs file could contain general background material on the Navy, such as “Navy Fact File”?
1. Command
 2. Project
 3. Speech
 4. Clip
- 13-5. In what public affairs file would you keep query sheets documenting the release of information orally?
1. Media relations
 2. Project
 3. Alibi
 4. News release
- 13-6. All **EXCEPT** which of the following items should be found in a welcome aboard booklet?
1. Mission statement
 2. General unclassified command facts
 3. Biography of all senior officers
 4. Brief command history
- 13-7. What is the most logical order for the portion of a command presentation that describes your unit?
1. Strict chronological order based on when a department or section was established
 2. Straight from the organizational chart, starting at the top and working down
 3. Straight from the organizational chart, starting at the bottom and working up
 4. Start with the most important department and end with the least important

13-8. All **EXCEPT** which of the following are rules for a good command presentation?

1. Avoid Navy acronyms
2. Keep sentences short
3. Keep charts and graphs simple
4. Use a variety of styles for “word” slides

13-9. What is the recommended length for command presentations?

1. 5 to 10 minutes
2. 10 to 12 minutes
3. 15 to 20 minutes
4. 20 to 25 minutes

13-10. In what paragraph of a flag officer’s biography would you find information about marital status and family members?

1. First only
2. Any middle paragraph only
3. Last only
4. Any paragraph

13-11. The standard biography format has what size margins?

1. One-half inch
2. Three-quarter inch
3. One inch
4. One and one-half inch

13-12. Which of the following titles in a flag officer’s biography is correct?

1. “...commanding officer”
2. Fred Lemming, Commanding Officer
3. Training Officer
4. Fred Lemming, an Unrestricted Line Officer

13-13. What office or authority owns an official flag officer’s biography and therefore has the ultimate say over its contents?

1. The public affairs office
2. The flag officer concerned
3. The Navy
4. The flag secretary

13-14. What office or authority determines the newsworthiness of Navy news?

1. The public affairs office
2. The commanding officer
3. The media it is released to
4. The nearest public affairs center

13-15. Which of the following media is the backbone of public information today?

1. Newspapers
2. Television
3. Radio
4. News magazines

13-16. All **EXCEPT** which of the following are advantages of radio as a mass communicator?

1. Immediacy
2. Longevity
3. Aural appeal
4. Mobility

13-17. What media type is the most potent?

1. Newspapers
2. Radio
3. Television
4. News magazines

13-18. You have received a request from *Time* magazine for help in completing an article about your command. How should you respond to this request?

1. Provide the information and file a copy in your alibi file
2. Provide the information and forward a copy to CHINFO
3. Forward the request to CHINFO for approval before providing any information
4. Forward the request to your commanding officer before providing any information

13-19. What type of publication is the Public Affairs Communicator?

1. News magazine
2. Consumer magazine
3. Internal memorandum
4. Trade journal

13-20. All **EXCEPT** which of the following are key words for dealing with the media?

1. Accuracy
2. Promptness
3. Politeness
4. Honesty

13-21. Which of the following is your most valuable asset when dealing with the media?

1. Accuracy
2. Politeness
3. Honesty
4. Promptness

13-22. Which of the following statements is true of reporters traveling aboard Navy ships and aircraft?

1. Travel may be provided when commercial transportation is available, as long as it is necessary to obtain the news material
2. Reporters may not use shipboard communications facilities
3. Transportation does not have to be in the interest of the DoD or DoN
4. Detailed information about media embarks can be found in chapter 8 of PA Regs

13-23. All **EXCEPT** which of the following should be included in a media information kit?

1. Biographies of senior officers
2. Command photographs
3. Welcome aboard booklets
4. Telephone numbers for the PAO and staff

13-24. In a news release about an upcoming day set aside for the public to visit your base, what phrase should be avoided?

1. General public visitation
2. Open house
3. Everyone invited

13-25. The psychological need for Sailors to be recognized and appreciated is addressed by which of the following programs?

1. Community relations
2. Home Town News
3. Internal information
4. CHINFO Merit Awards

13-26. What is the purpose of the Fleet Home Town News program?

1. To provide servicemembers with current news from their respective hometowns
2. To stimulate recruiting efforts in small towns
3. To provide information on servicemembers to major news media outlets
4. To report the status and achievements of servicemembers to the people in the member's home town

13-27. Home towners are processed and disseminated by which of the following activities?

1. CHINFO
2. FHTNC
3. Individual commands
4. Various hometown news media organizations

13-28. The Navy's Fleet Home Town News Center serves all **EXCEPT** which of the following organizations?

1. The Navy
2. The Coast Guard
3. The Marine Corps
4. The National Health Service

13-29. A servicemember from all **EXCEPT** which of the following areas is able to participate in the Home Town News program?

1. Alaska
2. The Republic of the Philippines
3. Guam
4. American Samoa

13-30. To receive hometown material from the FHTNC, clients must meet which of the following requirements?

1. Agree to publish all material received
2. Request the material through official channels
3. Pay a nominal fee for each item received

13-31. Under most circumstances, individual commands are authorized to submit hometown news directly to which of the following activities?

1. All recognized news media
2. The FHTNC
3. All newspapers within 50 miles of the command

13-32. In which of the following publications can you expect to find detailed information on submitting material to the FHTNC?

1. Fleet Home Town News Guide
2. U.S. Navy Public Affairs Regulations
3. Both 1 and 2 above
4. The AP Styleguide and Libel Manual

13-33. Which of the following blocks must be filled out for the form to be accepted for processing by the FHTNC?

1. Block 17 - signature
2. Block 19 - release number
3. Block 7 - name(s) of parent(s)
4. Block 15 - duties to which assigned

13-34. When 10 or more forms are submitted at the same time to the FHTNC, a releasing authority signature on the cover letter will satisfy the requirement for a signature in block 18 on each of the forms.

1. True
2. False

13-35. All **EXCEPT** which of the following news media have requested and receive home town news material from the FHTNC?

1. Newspaper
2. Radio stations
3. Television stations
4. News magazines

13-36. All **EXCEPT** which of the following categories of stories are processed by the FHTNC?

1. Military achievement
2. Personal achievement
3. Wedding announcements
4. Participation stories

13-37. A hold file is a collection of FHTNC forms that have what condition in common?

1. They are all about individuals who do not want any publicity
2. They are all about the members of a unit whose forms are kept at the FHTNC while that unit is on extended deployment
3. They are all of the forms for sea service personnel participating in the program
4. They are all of the forms held by the public affairs office prior to deployment

13-38. If an individual whose name in a hold file reenlists or is promoted in rate during a deployment, what should the administrator of the unit's hometown news program do?

1. Have the individual fill out a new form and mail it to the FHTNC
2. Notify the FHTNC by message of the event
3. Ask the individual to reconsider his "no publicity" stand
4. Nothing, since the individual has already requested no publicity

13-39. How often should hold files be updated?

1. Once a year
2. Once, midway through the deployment
3. Every 30 days
4. Every 60 days

13-40. Under which of the following circumstances should the FHTNC be an addressee on death or serious injury messages?

1. Only when the dead or injured person's name is listed in the hold file
2. Only when the dead or injured person's name is NOT in the hold file
3. Only when the death or injury was-job related
4. Under all circumstances

IN ANSWERING QUESTIONS 13-41 THROUGH 13-48, SELECT FROM THE LIST BELOW THE STORY CATEGORY IDENTIFIED BY THE QUESTION. RESPONSES MAY BE USED MORE THAN ONCE.

- A. Military achievement
- B. Personal achievement
- C. Participating story

13-41. Reenlistment.

1. A
2. B
3. C

13-42. Earned college degree.

1. A
2. B
3. C

13-43. Reported aboard.

1. A
2. B
3. C

13-44. Received award as Coach of the Year from local little league.

1. A
2. B
3. C

13-45. Port visit of ship.

1. A
2. B
3. C

13-46. Selected as Sailor of the Year.

1. A
2. B
3. C

13-47. Promoted to P02.

1. A
2. B
3. C

13-48. Received Good Conduct Medal.

1. A
2. B
3. C

13-49. A story about one person involved in one event would be submitted to the FHTNC as what type of story?

1. Roster
2. Personal
3. Individual
4. Military achievement

13-50. What is (a) the minimum number of prints and (b) the type of prints required when photographs are submitted to FHTNC?

1. (a) Four (b) black and white wallet size prints
2. (a) Six (b) color wallet size prints
3. (a) Five (b) black and white wallet size prints
4. (a) Four (b) color 8- by 10-inch prints

13-51. For single stories, negatives of any size are accepted by the FHTNC.

1. True
2. False

13-52. Your 90-day logbook should contain what information?

1. Number of releases generated by each form
2. News clippings of stories actually printed off each form
3. Date form was mailed to the FHTNC

DISTRIBUTION STATEMENT A: Approved for public release; distribution is unlimited.

Sailor's Creed

"I am a United States Sailor.

*I will support and defend the
Constitution of the United States of
America and I will obey the orders of
those appointed over me.*

*I represent the fighting spirit of the
Navy and those who have gone before
me to defend freedom and democracy
around the world.*

*I proudly serve my country's Navy
combat team with honor, courage and
commitment.*

*I am committed to excellence and the
fair treatment of all."*

THE UNITED STATES NAVY

GUARDIAN OF OUR COUNTRY

The United States Navy is responsible for maintaining control of the sea and is a ready force on watch at home and overseas, capable of strong action to preserve the peace or of instant offensive action to win in war.

It is upon the maintenance of this control that our country's glorious future depends; the United States Navy exists to make it so.

WE SERVE WITH HONOR, COURAGE, AND COMMITMENT

Tradition, valor, and victory are the Navy's heritage from the past. To these may be added dedication, discipline, and vigilance as the watchwords of the present and the future.

At home or on distant stations, we serve with pride, confident in the respect of our country, our shipmates, and our families.

Our responsibilities sober us; our adversities strengthen us. Service to God and Country is our special privilege. We serve with honor.

THE FUTURE OF THE NAVY

The Navy will always employ new weapons, new techniques, and greater power to protect and defend the United States on the sea, under the sea, and in the air.

Now and in the future, control of the sea gives the United States her greatest advantage for the maintenance of peace and for victory in war.

Mobility, surprise, dispersal, and offensive power are the keynotes of the new Navy. The roots of the Navy lie in a strong belief in the future, in continued dedication to our tasks, and in reflection on our heritage from the past.

Never have our opportunities and our responsibilities been greater.

PREFACE

About this course:

This is a self-study course. By studying this course, you can improve your professional/military knowledge, as well as prepare for the Navy-wide advancement-in-rate examination. It contains subject matter about day-to-day occupational knowledge and skill requirements and includes text, tables, and illustrations to help you understand the information. An additional important feature of this course is its reference to useful information in other publications. The well-prepared Sailor will take the time to look up the additional information.

By enrolling in this self-study course, you have demonstrated a desire to improve yourself and the Navy. Remember, however, this self-study course is only one part of the Navy training program. Practical experience, schools, selected reading, and your desire to succeed are also necessary to successfully round out a fully meaningful training program.

COURSE OVERVIEW: In completing this non-resident training course, you will demonstrate knowledge of the subject matter by correctly answering questions on the following subjects: The military postal service, designations and terminations, mail packaging and acceptance, domestic mail, international mail, registered mail, finance, handling and transportation, claims and inquiries, directory service, equipment and supplies, official mail, audits, reports and inspections.

THE COURSE: This self-study course is organized into subject matter areas, each containing learning objectives to help you determine what you should learn along with text and illustrations to help you understand the information. The subject matter reflects day-to-day requirements and experiences of personnel in the rating or skill area. Also, it reflects guidance provided by Enlisted Community Managers (ECMs) and other senior personnel, technical references, instruction, etc., and either the occupational or Naval standards, which are listed in *Manual of Navy Enlisted Manpower and Personnel Classifications and Occupations Standards*, NAVPERS 18068.

THE ASSIGNMENTS: The assignments that appear in this course are designed to help you understand the material in the text.

COURSE OBJECTIVE

The objective of this course is to provide Mass Communication Specialist (MC) with Public Affairs (PA) information.

INSTRUCTIONS FOR TAKING THE COURSE ASSIGNMENTS

The links and material that you are to study are included in each chapter. Study the material and links carefully before attempting to answer the questions. Pay close attention to tables and illustrations, and read the information in the links.

SELECTING YOUR ANSWERS

Read each question carefully, and then select the BEST answer. You may refer freely to the text. The answers must be the result of your own work and decisions. You are prohibited from referring to or copying the answers of others and from giving answers to anyone else taking the course.

SUBMITTING YOUR ASSIGNMENTS

To have your assignments graded, you must be enrolled in the course with the Non-Resident Training Course Administration Branch. Following enrollment, there are two ways of having your assignments graded:

- Use the Internet to submit your assignments as you complete them.
- Send all the assignments at one time by mail to CPPD, NRTC.

Grading on the Internet: Advantages to Internet grading are as follows:

- You may submit your answers as soon as you complete an assignment.
- You get your results faster.
- In addition to receiving grade results for each assignment, you will receive course completion confirmation once you have completed all the assignments.

To submit your assignment answers via the Internet, go to the following site:

<https://www.courses.netc.navy.mil>

Grading by Mail: When you submit answer sheets by mail, send all of your assignments at one time. Do NOT submit individual answer sheets for grading. Mail all of your assignments in an envelope, which you either provide yourself or obtain from your nearest Educational Services Officer (ESO). Submit answer sheets to the following:

*Commanding Officer
Center for Personal and Professional Development
ATTN: VOLED Det. (NRTC)
6490 Saufley Field Road
Pensacola, FL 32509*

Answer Sheets: Each course includes an answer sheet for your assignments. If you are going to mail in your answer sheets, please make copies of the included answer sheet. Explanations for completing the answer sheets are on the answer sheet.

Follow the instructions for marking your answer on the answer sheet. Be sure that blocks 1, 2, and 3 are filled in correctly. This information is necessary for your course to be properly processed and for you to receive credit for your work.

COMPLETION TIME

Courses must be completed within 12 months from the date of enrollment. This includes time required to resubmit failed assignments.

PASS/FAIL ASSIGNMENT PROCEDURES

You will be given the opportunity to resubmit failed assignments. You may resubmit failed assignments only once. Internet students will receive notification when they have failed an assignment; they may then resubmit failed assignments on the Web site. Internet students may view and print results for failed assignments from the Web site. Students who submit by mail will receive a failing result letter and a new answer sheet for resubmission of each failed assignment.

COMPLETION CONFIRMATION

After successfully completing this course, you can download a copy of your letter of completion on the NRTC Web site:

<https://www.courses.netc.navy.mil>

STUDENT FEEDBACK QUESTIONS

We value your suggestions, questions, and criticisms on our courses. If you would like to communicate with us regarding this course, we encourage you, if possible, to use e-mail. If you write or fax, please use a copy of the Student Comment form that follows this page.

For subject matter questions:

Contact the Center for Service Support, Newport, RI

Email: NWPT_CSS_RTM@navy.mil

Phone: 401-841-1057 or DSN 841-1057

For enrollment, shipping, grading, or completion letter questions:

Email: NRTC@navy.mil

Phone: Toll Free 1-877-264-8583

Comm: 850-452-1511

DSN: 922-1511

FAX: 850-452-1370

(Do NOT fax answer sheets.)

ADDRESS:

*Commanding Officer
Center for Personal and Professional Development
ATTN: VOLED Det. (NRTC)
6490 Saufley Field Road
Pensacola, FL 32509*

Privacy Act Statement: Under authority of Title 5, USC 301, information regarding your military status is requested in processing your comments and in preparing a reply. This information will not be divulged without written authorization to anyone other than those within DOD for official use in determining performance.

CHAPTER 1

THE NAVY MASS COMMUNICATION SPECIALIST

Learning Objective: *Upon completing this chapter, you should be able to do the following:*

- *Identify the major tasks and responsibilities of the Navy mass communication specialist.*
 - *Discuss the personal traits required for one to best perform the duties of an MC.*
 - *Identify the applicable NECs.*
 - *State the purpose of the MC Basic Nonresident Training Course (NRTC).*
-

INTRODUCTION

To the young man or woman choosing a Navy career field, whether for one enlistment or for 30 years, the mass communication specialist (MC) rating offers endless avenues for an imaginative, yet mature, thinker.

The MC rating was born July 1, 2006, when the Navy officially merged four ratings – illustrator draftsman, lithographer, journalist and photographer's mate. Each brought to the new rating a rich history and heritage as well as valuable skill sets.

Many of the duties and responsibilities of today's mass communication specialist rank among Americans' favorite hobbies and pastimes, such as writing, photography and graphic design. The Navy MC learns and practices a distinguished profession and is an official representative of the Navy in public affairs and visual information matters.

As public affairs and visual information experts, MCs present the story of America's Navy to audiences in the Navy and to the rest of the world through a variety of mediums. MCs write and produce print and broadcast journalism news and feature stories for military and civilian newspapers, magazines, television and radio broadcast stations. They capture video and still imagery of military operations, exercises and other Navy events. They serve overseas, on ships, and at stateside commands as photographers, videographers, public affairs specialists, newspaper and magazine staff members, and TV and radio station staff and talent. MCs also create graphic designs in support of the public affairs mission, create and manage official websites, and perform high-speed, high-volume graphic reproduction.

MAJOR TASKS AND RESPONSIBILITIES

In our representative republic, government depends on the consent of the governed. This important principle means that, in the long run, the U.S. government does only what the people want it to do. Therefore, we can have a Navy only if the people know and understand the importance of the Navy and support it.

The Navy, like other services, depends on this country's citizens for the four key tools of its trade — personnel, money, materials and the authority to carry out its mission. As a Navy MC, your main function is to make available the facts about your Navy to the Navy's three main publics —the people at your command, Navy people in general and the people of the United States as a whole.

As written by the current Chairman of the Joint Chiefs of Staff and former Chief of Naval Operations Adm. Mike Mullen: "Effectively communicating with our Sailors, their families and the American people is one of our most important responsibilities. Like the battle for people, this responsibility is one that must be embraced every day. If we don't take the lead in the communication business, we are forced to react to other competing, and in some cases incorrect, messages."

Although the responsibility of communicating the Navy's message to both internal and external audiences lies in the hands of our commanders, the Navy MC successfully completes this mission from the deckplates by delivering the message in a way everyone can understand.

In order to perform these duties, the MC must master verbal, oral and visual communication techniques. He must be a constant reader who is always abreast of current events in and out of the Navy as well as with professional trends from around the visual communication specialty. He must know enough about the Navy to interpret and translate its activities and actions intelligently to the civilian public. In other words, an MC must stay up to date with what ships or units are on deployment, what new technology is being used in the Navy, who is in the chain of command, etc.

As a mass communication specialist, you must have the ability and the desire to learn and grasp new ideas. You must be better than average in your use of the English language, know your way around camera equipment, and be proficient in your computer skills. Your aim is to create news-quality products in minimal time and with minimal need for editing or reproduction.

The major areas in which you will be expected to develop knowledge and skills are audio/visual production, digital imaging, information and newsgathering, multimedia production, photography, print production, planning, public affairs and writing.

As you progress in experience, maturity and service seniority, you likely will become the trusted executive of the public affairs officer (PAO). As such, you will find yourself performing many of the functions of a PAO. This will be particularly true if your boss is a collateral-duty PAO. Collateral duty means that the individual has other assignments that are considered primary duties. In such cases, the collateral-duty PAO's primary responsibilities often allow only minimum time for public affairs work. Therefore, you also must learn the theory and practice of public affairs policy.

A COMMON MISPERCEPTION

There is a tendency for Navy MCs to believe they are part of America's free press and thus part of the investigative photojournalism genre. This notion could not be further from the truth.

Navy MCs are assigned combat camera, visual communication, command information, public information and community relations duties. Navy MCs write releases to tell the Navy story and to respond to queries by the investigative free press. When assigned to command information staffs, MCs may write for civilian enterprise (CE) or command-funded newspapers — what the industry terms "in-house" publications. (*We will discuss in-house publications in subsequent chapters.*)

Just as a writer for commercial industry would not write investigative articles concerning his company for the in-house publication, Navy MCs do not write investigative pieces concerning their own commands or the Navy. Navy MCs may tackle controversial social issues, but they must avoid works that attack or injure, or give the impression of attacking or injuring their commands or the Navy. MCs serve as the window for all Americans to see into the Navy.

The Navy community is much like a company town. Your job within this community is to enhance morale, to increase readiness and productivity, to be the voice of the commanding officer to his community, and to inform, educate and entertain the Navy's internal audience.

PERSONAL TRAITS

The Navy MC must possess certain personal characteristics. Some are general in that they can contribute to success in any rating, but others are an integral part of the public affairs/visual information profession. Appearance, voice, military bearing, courtesy and personality will become more evident as you read and complete this Nonresident Training Course (NRTC), informally known as a rate training manual.

APPEARANCE

Good personal appearance is especially important to the Navy mass communication specialist. Since your duties place you in a position to meet visitors, escort media, interview senior leadership, cover high-level events, and serve as a tour guide, to name a few, impeccable appearance is more necessary than in some other jobs in the Navy. Always make sure every aspect of your personal appearance – from your haircut to the edge dressing on your shoes – is first-rate.

VOICE

Navy MCs must be well spoken; voice and manner of speaking are important. To meet this standard, you should avoid an overly loud voice; but likewise, you should avoid speaking too low or indistinctly. Localisms of vocabulary or an accent may be merely pleasant marks of individuality, or they may be hindrances because they make the speaker hard to understand. If you have conspicuous speech habits of this sort, you should attempt to correct them. Remember, MCs are often the voice of the command, so your attention to the proper pronunciation of words will always be worthwhile.

MILITARY BEARING

All Sailors have an obligation to conduct themselves with dignity and in such a manner as to reflect credit on the naval service. Dignity exists only where the individual has a proper sense of his own worth and of the worthiness of his cause. The person who possesses true dignity also will respect the dignity of others.

Military bearing is dignity within military relationships. It exists when the individual is proud of his military organization and of his part in it. He respects his seniors and is guided by the example of those he admires most among them. He also respects his juniors and provides an example they will be proud to follow. Whether he is squaring his hat, rendering a salute, carrying on the work of his office, or going on liberty, his manner says he is proud of America's Navy and is doing his best to make the Navy proud of him.

More than any other rating in the Navy, MCs interact frequently with senior leaders as well as the civilian community. It is for this reason that your military bearing must be top-notch.

NAVY ENLISTED CLASSIFICATIONS

MCs can be found throughout the Fleet, serving aboard aircraft carriers and large-deck amphibious assault ships, with Seabees, at Defense Media Activities, with combat camera, at shore

facilities, recruiting commands or with the Navy Public Affairs Support Element. And, they support the fleet with a wide variety of skills and expertise. These job skills are categorized as Navy Enlisted Classifications (NECs). NECs are four-digit numbers that indicate special qualifications earned by an individual. The NECs described below are available to MCs.

8143—MOTION MEDIA CAMERAMAN

A motion media cameraman primarily functions as a camera operator who creates controlled and uncontrolled motion media productions, prepares shooting scripts and performs post-production editing. An 8143 MC also acts as a director on small production crews.

To earn the 8143 NEC, you must complete the 33-day Video Production and Documentation course at the Defense Information School (DINFOS).

8144—MOTION MEDIA EDITOR/DIRECTOR

A motion media editor or director serves as the senior editor for motion media productions and combat camera missions and acts as the on-scene crew chief for video and multimedia products. In doing such, an 8144 MC must determine equipment and material requirements, direct action in the production of scenes and episodes, analyze existing scripts and recommend appropriate revisions, determine scene composition, coordinate action of performing personnel, direct audio recording during filming, supervise the preparation of the set, and approve set design and props to be used.

To be an 8144 NEC, you must attend the 10-month advanced motion media program at Syracuse University. This is a selection-only program that requires a submission package. A NAVADMIN released annually outlines submission requirements. Upon completion of the program, graduates earn approximately 30 college credit hours. Through the course, you learn from some of the industry's finest professionals to create professional, high-impact communications and become top-quality storytellers.

8147—PHOTOJOURNALISM SPECIALIST

Sailors with this NEC cover and photograph events of news or documentary interest, while supporting and effectively meeting the public affairs objectives and programs of the military services. They apply layout and design principles, news and feature writing, basic and advanced photographic techniques and production, and demonstrate writing and photographic skills.

To earn this 8147 NEC, you must complete the eight-week Intermediate Photojournalism Course (IPC) offered at DINFOS. The course requires one-year minimum fleet experience as well.

8148—PHOTOJOURNALIST

Sailors with the 8148 NEC photograph newsworthy events, prepare photography in news form, write captions and text for news stories, and maintain liaison with their counterparts in the news media. They also train personnel in photojournalism techniques.

To earn the 8148 NEC, you must attend the 10-month advanced photojournalism course at Syracuse University. As with the 8144 NEC, MCs interested in this program must submit a package. Package requirements and deadline submissions can be found in the annual NAVADMIN. Upon completion of the program, graduates earn approximately 30 college credit hours. Through this

course, you will learn to tell the Navy's story with pictures by attending courses in graphics, news writing and photography.

Note: This program may be cut due to budget constraints. Talk to your chief or career counselor for more details.

8150—BROADCASTER

Navy broadcasters collect, evaluate and prepare military information for broadcast over the airways via Armed Forces Radio and Television (AFRTS) networks as well as over Shipboard Information, Training and Entertainment (SITE) closed-circuit television systems. They use all skills gained in their public affairs and visual information experience to visually and verbally tell the story of America's Navy. Broadcasters will most likely be assigned aboard aircraft carriers and large-deck amphibious ships or at the Defense Media Activity or its subordinate commands.

To earn the 8150 NEC and become a broadcaster, you need to attend the Basic Combat Correspondence Course at DINFOS. A voice audition is required before a quota in the course is granted, and you must hold a secret clearance.

8151—GRAPHIC ILLUSTRATOR

The graphic illustrator is an expert at design and layout, color theory, realistic drawing, color media, and desktop publishing with a strong background in computer management and visual communication.

To earn the 8151 NEC and become a multimedia illustrator you must attend the Basic Multimedia Illustrator Course at DINFOS and to be in paygrades E-1 to E-6. A secret clearance, normal color vision and distance visual acuity correctable to 20/20 are also required.

8152—PUBLIC AFFAIRS OFFICER (ENLISTED)

An 8152 MC performs master-level duties as a public affairs officer or special assistant to his or her commanding officers. The enlisted PAO may also serve as a spokesperson for the Navy and the Department of Defense.

The enlisted PAO NEC is open to pay grades E-7 through E-9 (waivers for MC1s with orders to specific billets may be available through the detailee). To earn the 8252 NEC, you must attend the Public Affairs Qualification Course at DINFOS and be eligible for a secret clearance.

8153—PUBLIC AFFAIRS SUPERVISOR

Public affairs supervisors manage public affairs programs as command representatives or special assistants by gathering information for press releases, answering media and public questions, and being command spokespersons. In this job, MCs work independently and with public affairs officers and senior public affairs enlisted personnel.

The 8153 NEC is earned by attending the Intermediate Public Affairs Specialist Course at DINFOS and is open to personnel in paygrades E-5 through E-7. You must be eligible to hold a secret clearance.

8193— ELECTRONIC IMAGING SYSTEM SPECIALIST

An MC who holds the 8193 NEC installs, configures and operates advanced electronic imaging systems to acquire, import, enhance, print, store, export and electronically transmit and receive digital images from shore-based, afloat or airborne platforms.

To earn the 8193 NEC, you must attend the Digital Multimedia Course at DINFOS; however, waivers are available when specialized university training in photojournalism has been completed. For more information on submitting a waiver, talk to your career counselor and review the *Navy Enlisted Manpower and Enlisted Classification and Occupational Standards* ([NEOCS](#)) Manual, NAVPERS 18086F.

8288—AERIAL CAMERAMAN

An MC qualified as an 8288 performs in-flight duties as an aerial cameraman and is knowledgeable of photographic equipment, aerial photographic techniques, aircraft equipment, emergency procedures and flight procedures.

To earn this 8288 NEC, you must attend the Naval Aircrew Candidate School at Naval Air Station Pensacola, Fla. More information on the program can be found in the *Naval Military Personnel Manual* ([MILPERSMAN](#)).

3251—BROADCAST MANAGER

The MC broadcast manager directs the operation of radio, television, satellite, cable, and shipboard SITE systems as coordinated elements of the command information broadcasting function. She also coordinates with the Defense Media Activity to support American Forces Information Service products and taskings.

To earn the 3251 NEC, you must attend the Broadcast Managers Course at DINFOS or by completing at least two previous management assignments with AFRTS activities.

5345 —SCUBA DIVER

MCs who possess the 5345 SCUBA diver qualification provide underwater photographic support to the Navy diving community during underwater operations, detailed ship-bottom repairs, SEAL delivery team (SDV) training and operations, explosive ordnance disposal (EOD) missions, and search and recovery operations. MC Billets requiring the 5345 NECs are unique to combat camera.

To earn the 5345 NEC, you must be placed in one of the combat camera billets and attend the SCUBA Diver Course at the Naval Diving and Salvage Training Center in Panama City, Fla.

NOTE: You may obtain further information on all NECs by consulting the Manual of Navy Enlisted Manpower and Personnel Classifications and Occupational Standards ([NEOCS](#)) Manual, Volume I (Navy Enlisted Classifications), NAVPERS 18068F. Additionally, the MC Learning and Development Roadmap (LaDR – pronounced "ladder") is a navigable rate-specific guide that provides an overview of what is required from E-1 to E-9 with regards to professional development. A link to the MC rating roadmap is available via the Mass Communication Specialist page on Navy Knowledge Online (NKO).

SUMMARY

In this chapter, you learned what it takes to be a U.S. Navy mass communication specialist and about the many jobs you can perform within the rating. More information about the Navy MC rating can be found in the *Navy Enlisted Manpower and Personnel Classifications and Occupational Standards (NEOCS) Manual*.

As you continue through the pages of this manual, you will build upon this knowledge, gaining a strong base of knowledge to draw on for the rest of your career, but this is only the beginning. Every day should be one of learning new skills to perform your role as the Navy's storyteller.

(This page intentionally left blank).

CHAPTER 2

PRINCIPLES, FUNDAMENTALS AND ORGANIZATION

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Identify the Navy principles of public affairs.
 - List the Department of Defense Principles of Information.
 - Identify the role of the Chief of Information.
 - Discuss the Navy public affairs organization.
 - Discuss the roles of CHINFO field activities.
-

INTRODUCTION

As a member of the Navy public affairs and visual information team (PA/VI), you will be responsible for delivering truthful, timely and accurate information to your audiences. The following chapters will provide you with the basic tools needed to become an effective communicator. However, these tools provide only the basics. Every day spent as a Navy MC should be spent building upon what you learn here.

More detailed information and resources can be found in Department of Defense (DoD) Directive 5400.13 (Defense Public Affairs Doctrine), Joint Publication 3-61 (Joint Public Affairs Doctrine), SECNAVINST 5720.44 (Public Affairs Policy and Regulations – PA Regs), *Public Affairs Tactics Manual*, [P-A Net](#) and [Navy Knowledge Online](#).

Note: To access P-A Net you must have log-in information, this is discussed further in Chapter 3.

PRINCIPLES

In the Navy, our job as PA/VI communicators is driven by basic principles – accountability to the public, full disclosure, expeditious release, message alignment and ethics.

Accountability to the Public - An open, ambitious public information policy is the assurance that the Department of the Navy (DON) remains accountable to the public. We accomplish this by encouraging a free flow of information, restricted only by legitimate constraints of security, accuracy, propriety and policy (SAPP).

Full Disclosure - For a government founded on the principle of an empowered public, the default position is full and prompt disclosure. Withholding information must be the exception and justified for specific and legally defensible reasons. Potential embarrassment is not justification to withhold information. Delays in the release of information can be damaging and even more embarrassing.

Expeditious Release - Information should be released as quickly as practical, and from the lowest possible level, consistent with release policies and required reviews. As a junior MC, you should verify local releasing procedures within your leadership chain. Chapter 2 of the *Navy Public*

Affairs Regulations and Chapter 3 of this manual further outline policy and guidance on the release of information.

Message Alignment – Message alignment is crucial to ensuring audiences receive consistent information through all internal communication mediums. Message alignment is accomplished through development, approval, distribution, and use of command-generated and higher-level public affairs guidance and CHINFO products. In addition to specific public affairs guidance, other examples of message-alignment tools include Rhumb Lines, quick responses and the maritime strategy. These items will be defined in detail in Chapter 3.

Ethics - Ethics is the discipline of moral duty and obligation. The Navy holds itself to a high ethical standard. In its dealings with the public, DON must adhere rigorously to such a standard, because a loss of public confidence can undermine DON's ability to complete its mission on all levels. Thus, the loss of confidence can have negative consequences on the Navy's warfighting capability.

The Navy public affairs principles of information are founded on the DoD Principles of Information. While the differences are minimal, it is important to be familiar with both sets of principles. DoD principles of information apply to all Navy public affairs and visual information products:

DoD PRINCIPLES of INFORMATION

Note: To download a full-color graphic of the DoD Principles of Information, follow click [here](#).

a. Information shall be made fully and readily available, consistent with statutory requirements, unless its release is precluded by national security constraints or valid statutory mandates or exceptions. The Freedom of Information Act (FOIA) will be supported in both letter and spirit. FOIA will be further discussed in Chapter 3.

b. A free flow of general and military information shall be made available, without censorship or propaganda, to the men and women of the armed forces and their family members.

c. Information will not be classified or otherwise withheld to protect the government from criticism or embarrassment, when the information itself is unclassified.

d. Information shall be withheld when disclosure would adversely affect national security, threaten the safety or privacy of U.S. government personnel or their families, violate the privacy of the citizens of the United States, or be contrary to law.

e. The DoD obligation to provide the public with information on its major programs and operations may require detailed public affairs planning and coordination in the DoD and with the other government agencies. Such activity is to expedite the flow of information to the public; propaganda has no place in DoD public affairs programs.

FUNDAMENTALS

The foundation of public affairs rests upon a four-step, cyclical process known as RPIE, pronounced "are-pie." The RPIE process includes research, planning, implementation and evaluation. Every event, incident or occasion – planned or unplanned – covered by PA or VI requires you to go through these steps. Each step is as important as the next, and none should be skipped.

Research is the starting point for developing any project you need to accomplish. In this step, you will gather information and define the situation, problem, event or opportunity. You will also identify your audiences and needed resources. Resist the tendency to skip this step; research is the foundation set for the other steps to be successful.

Planning is the second, and most important, step. In this step, you build upon your research, using information gathered to make your plan, considering your goals and identifying what needs to be done.

Implementation is the third step. This is the time to put your research and planning into action. Resist the urge to make changes when carrying out the plan, because it usually will create more problems than it will solve. Don't discard proposed changes; however, make note of them. These notes will come in handy when you are evaluating.

Evaluation begins during the implementing phase as you are jotting down any changes or improvements you want to make. It is an assessment of the preparation, implementation and outcome (impact) of the situation. Results of the evaluation should be documented for use in future projects. Lessons learned, as these results are commonly referred, are invaluable for not only planning future events, but also in handling unexpected crises.

ORGANIZATION

Public affairs organization, as with all other aspects, within DON is designed to provide maximum flow of information to the American people with minimum delay, subject only to operational security, statutory limitations and the safety of personnel. Further explanation of this organization is found in [SECNAVINST 5720.44](#) (PA Regs).

Multiple Channels of Authority - U.S. national policy is multifaceted, and a number of agencies execute portions of that policy. This gives rise to multiple channels of authority within the U.S government and the Navy.

ASD(PA) Authority - The Secretary of Defense (SECDEF) delegated authority to the Assistant Secretary of Defense for Public Affairs, or ASD(PA), to communicate directly with DoD components on public affairs matters, provide public affairs guidance directly to the Unified Commanders and direction to the Navy and Marine Corps through the Secretary of the Navy (SECNAV).

Department of the Navy - SECNAV is responsible for establishing DON public affairs policy and directing its implementation. SECNAV monitors and controls Navy and Marine Corps relations with Congress, SECDEF, other principal government officials and the public. Implementation of SECNAV'S policies is the responsibility of the Chief of Naval Operations, the Commandant of the Marine Corps and other senior commanders who report directly to the SECNAV. The [SECNAV Organization](#) page can be found on Navy.mil.

Chief of Information (CHINFO) - As the direct representative of SECNAV, CHINFO is the Navy's information chief and is delegated the responsibility for coordinating, planning and implementing the Navy's public affairs policies and programs. This includes exercising command of the Navy Offices of Information and other CHINFO field activities and providing direction to public affairs programs throughout the DON.

CHINFO Field Activities - To achieve the public affairs objective in an efficient and cost-effective manner, CHINFO must communicate at the regional and national levels with local and

regional news media, local governmental leaders, key community leaders, key educators and local/regional business leadership. Through its field activities, CHINFO is responsible for Navy reputation management, including national image and branding efforts, by bringing the Navy message directly to the American public.

CHINFO Field Activities include two Navy Offices of Information (NAVINFO), Navy Public Affairs Support Elements (NPASE) and the Fleet Hometown News Center (FHTNC).

Navy Offices of Information

- NAVINFO East, headquartered in New York, informs the men and women of the U.S. Navy, their families and the American public of key issues relating to the Navy. From assisting Girl Scout troops during Operation Cookie Drop to escorting embarks at Fleet Week, to informing media on the commissioning of USS New York (LPD 21), NAVINFO East is involved in many diverse activities in the New York metropolitan area. NAVINFO East also serves as a Navy contact for publishers requesting Navy support in coordination with CHINFO and related Navy commands and assists with requests for Navy props and assets for productions in the New York area.
- NAVINFO West coordinates requests for Navy support with the major film, television and documentary production companies both throughout Los Angeles and worldwide. Production assistance from the Department of Defense means filming access to the Navy's professional people and the most modern equipment.

Navy Public Affairs Support Element, formerly known as the Fleet Public Affairs Center, is headquartered in Norfolk. However, the CHINFO field activity is divided into NPASE East and West, located in Norfolk and San Diego respectively. NPASE teams, made up of public affairs officers and MCs, provide expeditionary public affairs forces and support the fleet with scalable and deployable forces trained and equipped to support current and emerging public affairs requirements. NPASE detachments are located in Jacksonville, Fla.; Bremerton, Wash.; Honolulu; Yokosuka, Japan; and Naples, Italy.

Fleet Hometown News Center is headquartered in Norfolk and is a sub-command of NPASE. The mission of FHTNC is to tell the story of the Navy, Marine Corps and Coast Guard one hometown at a time. FHTNC will be discussed in Chapter 4 of this manual.

Defense Media Activity (DMA) – Was established in October 2008 as a result of the Defense Base Realignment and Closure Act. DMA consolidates the Soldiers Media Center, Naval Media Center, Marine Corps News, Air Force News Service and American Forces Information Service into a single field activity. DMA also includes Stars and Stripes newspaper and the Defense Information School.

DMA is the Department of Defense's direct line of communication for news and information to U.S. forces worldwide. The agency presents news, information and entertainment on a variety of media platforms, including radio, television, Internet, print media and emerging media technologies. DMA headquarters is currently under construction at Fort George G. Meade in Maryland.

Operating Forces - Subject to the direction of senior authority, each officer who exercises command authority is responsible for the conduct and planning of public affairs. Public affairs is a command function, and public affairs officers report to their respective commanders or commanding officers on all PA issues. In most instances, however, commanders and COs delegate public affairs planning and execution to PAOs.

Public Affairs Officers - Public affairs officers serve as principal assistants to combatant commanders and commanding officers, advising them on all public affairs matters. Additionally, the PAO is the primary spokesperson for the command and liaises with media.

SUMMARY

In this chapter, you learned the basic principles and fundamentals of DoD and Navy public affairs. Chapter 3 builds upon this foundation by delving further into policies, procedures and guidance that govern public affairs in today's Navy.

(This page was left blank intentionally).

CHAPTER 3

POLICIES AND GUIDANCE

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Identify the instructions that govern DoD and Navy public affairs.
 - Identify the procedure for releasing information to the public.
 - Identify the basic provisions of the Freedom of Information Act.
 - Explain defamation and copyright laws.
-

INTRODUCTION

Department of Defense (DoD) and Navy policies, instructions and guidance exist to assist you with your duties as an MC. This chapter will briefly touch on the most common of these. More detailed information and links to the documents discussed in this chapter can be found on the [DoD Issuances](#) and [DON Issuances](#) websites as well as on [P-A Net](#).

PUBLIC AFFAIRS GOVERNING INSTRUCTIONS

DoD Instruction 5400.13 (Public Affairs Operations) – This instruction addresses PA roles and responsibilities across the Department of Defense, including the secretaries of the military departments, the joint chiefs of staff, combatant commanders and the heads of the other DoD components.

Joint Publication 3-61 (Joint Public Affairs Doctrine) – This PA publication provides joint doctrine for public affairs support during joint operations and U.S. military support to news media in conjunction with military operations. It provides guidance to the joint force commander (JFC) when communicating with national, international and internal audiences.

SECNAVINST 5720.44 (Public Affairs Policy and Regulations) – Known as the PA Regs, this instruction provides basic policy and regulations for carrying out public information/media relations, community relations and internal information for the Department of the Navy. As an MC, this should be your primary resource and should be referenced whenever questions about Navy public affairs arise.

Public Affairs Tactics Manual - The PA Tactics Manual is a “how-to” partner to the PA Regs, SECNAVINST 5720.44. The “Regs,” in general, is the “what-to-do” and “what-not-to-do” complement to this partnership. Used in tandem, these documents address most public affairs issues you and your PAO will face. Referring to them frequently is a wise tactic. The tactics manual can be found on P-A Net.

OPNAVINST 3104.1A (Navy Visual Information Policy and Responsibilities) – This instruction provides information on forms of visual or pictorial representation, either with or without sound. Visual Information (VI) includes still and motion imagery; hand- or computer-generated graphic art and animations; related captions, overlays and intellectual control data; and the processes and resources that support them. Module 2 of this manual focuses on VI and provides more in-depth information into this instruction.

Public Affairs Guidance (PAG) – PAG’s overarching purpose is to ensure message alignment, and it is tailored to specific events, subjects or issues. Within PAG, you will find themes and messages, possible questions and proposed answers, and background information. As an

MC, you should use PAG in the development of all your products, to include print stories, imagery captions and multimedia productions. Examples of previous PAG, Rhumb Lines and quick responses can be found on [P-A Net](#).

- *Rhumb Lines* – CHINFO produces *Rhumb Lines* weekly for senior Navy leadership, including SECNAV, the CNO, flag and general officers, and civilians to give them the situational awareness and information they need to effectively communicate Navy priorities. In every Rhumb Lines, you will find quotations from senior leadership, talking points, key messages and pertinent facts and figures. *Rhumb Lines* is CHINFO's principal message alignment tool for ensuring that the diverse and dispersed cadre of naval leaders can speak with one voice on critical issues.
- *Quick Responses* – A "quick response" summarizes a specific issue or incident and provides background information, while giving the response information for a potential media query. Facts or talking points are also included.

P-A Net – The Navy public affairs and visual information community of practice, is CHINFO's integrated suite of knowledge management, workflow processes and collaboration tools. P-A Net gives us the opportunity to share information across the entire enterprise. Since P-A Net is Web-based, it can be accessed from any computer with Internet connectivity. Access to P-A Net is obtained through CHINFO's policy, doctrine and technology division. However, prior to requesting access, you must be registered with up-to-date information in the [Navy PA Directory](#).

The Associated Press Stylebook and Briefing on Media Law - The AP Stylebook is the "gold standard of news writing" and allows you to write with the consistency and professionalism of civilian news writers throughout the world. Not only does it offer more than 3,000 A-to-Z entries, but also includes rules on grammar, spelling, punctuation, capitalization, abbreviation, and word and numeral usage. Additionally, as the name implies, the AP Stylebook provides guidance on business reporting, sports reporting and media law, to include libel and copyright infringement. Such legal concerns will be further discussed in the media law portion of this chapter. The Associated Press updates this reference annually; however, periodic updates are available through the [online version](#).

U.S. Navy Style Guide – Unless otherwise noted in the [U.S. Navy Style Guide](#), MCs should follow the most recent edition of the Associated Press Stylebook. Like the AP Stylebook, the Navy reference provides guidance unique to the Navy. Local style items, specific to your command or unit, should also be established and maintained to ensure consistency not only for MCs, but also for the command's audiences.

These references are the foundation for Navy MCs. However, many additional documents exist to aid us with our job as Navy PA/VI specialists. Various instructions and directives are interwoven into this manual.

GUIDELINES FOR RELEASE

Understanding the basic policy on the release of information is the cornerstone of everything we do in Navy public affairs. It affects what information we release to the public, how we handle the media, what we publish and how we respond to the public in general. Remember, DoD and Navy public affairs policies mandate us to be as open as possible and release information with minimum delay.

Some information is not releasable, such as that which would adversely affect national security, threaten the privacy or safety of personnel or their families, violate the privacy of an individual or that which is contrary to law. Command leadership is responsible for all public affairs activities, including the release of information; however the authority to release information is often delegated to the public affairs officer.

As a junior MC it is not likely that you will be given the authority to release information, but it's imperative for you to understand the guidelines. For more information, see Chapter 2 of the PA Regs and when in doubt a good rule of thumb is to consult your PAO or your chief.

The general limitations to the maximum disclosure policy can be easily remembered by the acronym SAPP, pronounced "sap", which stands for security, accuracy, propriety and policy.

- **Security** – Security is the first and most important limitation. It refers to information that is formally classified or falls under operational security (OPSEC) or the Essential Elements of Friendly Information (EEFI). Release of this type of information could cause harm to national security. OPSEC and EEFI guidance can be found in [OPNAVINST 3432.1](#) (Operations Security).
- **Accuracy** – The second most important limitation is accuracy. As an MC writing a story, shooting imagery or producing a multimedia production, you won't normally be the subject-matter expert. However, your job requires you to verify all information for accuracy **BEFORE** the product is released. **NEVER** shall you release information unless you are sure it is accurate. Inaccuracy wrecks credibility.
- **Propriety** – Ensuring propriety means verifying all released products are in good taste. For example, if you write news or a feature story, it is inappropriate to include tasteless humor, embarrassing comments, etc. Propriety also applies to photographs. Don't release photographs that may cause distress to members of your audience. An obvious example is a photograph of a deceased service member. If ever in doubt, ask your chief or supervisor.
- **Policy** – In some situations, policy may specify release guidance. For example, DoD policy calls for releasing at the seat of government the names of personnel killed in action. Here are some other examples of a DoD policy that must be followed:

ACCIDENTS and INCIDENTS – Major accidents or incidents require public affairs support immediately as well as around the clock in the days following. It is a good bet that you will never be 100-percent prepared for all accidents and incidents, but as mentioned earlier in the manual, planning is key.

In the event of a significant accident or incident, it is imperative the information is made available to the public using the maximum disclosure, minimum delay guideline and not be held pending inquiry. Per Chapter 2 of the PA Regs, the goal is to release the information within one hour of the time the command is notified. However, releases should not be distributed before the situational or operational reports (SITREPS and OPREPS) have been sent. Doing so can unduly influence an investigation and inadvertently drive the crisis.

Nuclear Accident and Incident guidance – According to [DoD Directive 5230.16](#), Nuclear Accident and Incident Public Affairs Guidance, responses to all public queries about the locations of nuclear weapons must include one of the following statements, as appropriate:

- "It is U.S. policy to neither confirm nor deny the presence or absence of nuclear weapons at any general or specific location."
- "It is general U.S. policy not to deploy nuclear weapons aboard surface ships, tactical submarines and naval aircraft. However, we do not discuss the presence or absence of nuclear weapons aboard specific platforms."

More information on producing news releases in conjunction with accidents and incidents can be found in limited length in Chapter 5 of this manual and more indepth in the PA Tactics manual.

PERSONAL INFORMATION – Information released on military and civilian personnel is governed by the Privacy Act of 1974 and [SECNAVINST 5211.5](#) (Department of the Navy Privacy Program). Generally, the following personal information is releasable and not considered an invasion of personal privacy:

For civilian employees:

- Name
- Present and past grades
- Present and past salaries
- Present and past duty stations
- Office or duty telephone number(s)

For military service members:

- Name
- Rank and date of rank
- Gross salary
- Present and past duty stations
- Future assignments that are officially established
- Office or duty telephone number(s)
- Source of commission
- Promotion sequence number
- Awards and decorations
- Attendance at professional military schools
- Duty status at any given time (active, reserve)

While this information is releasable on a case-by-case basis, blanket requests seeking information on a group of individuals or records should be considered with the help of a Privacy Act expert. If ever in doubt, talk to your chain of command.

The Freedom of Information Act (FOIA) – In 1966, FOIA gave the public the right to access records of the executive branch of the federal government, establishing for the first time in U.S. history the right of "any person" to seek access to these records. FOIA requests often center on the programs and activities of the DoD, including, but not limited to, the following:

- Projected retirees
- Deck logs
- Investigations
- Contracts
- Nuclear weapons
- Disposal of toxic substances

FOIA requests must be made in writing to be official. Once received, the Navy must respond to the request within 10 working days. However, you may make a written formal time-extension request back to the requester of up to 10 additional working days. This letter must be approved and signed by higher authority and include the reason for which an extension is required. The letter must also indicate that the requester may make an appeal to the appropriate appellate authority within 60 calendar days.

- The FOIA generally provides access to U.S. government records that result from the gathering of data. While many records qualify for release under FOIA, some records that do not include:
 - Objects or articles (such as structures, furniture, paintings, sculpture, three-dimensional models, vehicles and equipment)
 - Administrative tools (such as computer software)
 - Intangible records (such as an individual's memory or oral communication)
 - Personal records not subject to agency creation/retention (such as notes to jog the memory of an employee)
 - Unaltered publications and processed documents available to the public through other means (such as regulations, maps and manuals)
- According to the PA Regs, however, "information releasable under FOIA will be released without the requestor having to submit a FOIA request, particularly if the requestor is a news media representative. Release of information without requiring a FOIA request will often save labor and cost for both the requestor and the DON activity." Always check with your chief and/or PAO before making this exception though.

More information regarding FOIA can be found in the Department of the [Navy FOIA program instruction](#) (SECNAVINST 5720.42) and in Chapter 7 of the PA Regs.

WEBSITE POLICY – The management and oversight of all content on a publicly accessible Navy command website is a public affairs function, while the design and layout of websites is a visual information function.

The instruction governing official command websites is SECNAVINST 5720.47, entitled [Department of the Navy Policy for Content of Publicly Accessible World Wide Web Sites](#).

MCs serving as webmasters, however, should become familiar with all regulations governing websites and should bookmark [DoD's page for webmasters](#).

The need to provide public information to the Navy's various audiences must be balanced with the need to protect operational security, privacy of information, information security and personal safety. The appearance, accuracy, currency and relevance of the information presented by Navy commands on their websites reflect on the Navy's professional standards and credibility. Commands should limit posted information to information unique to their command. If you don't own the information, don't post it directly. Linking to other government sites is best practice here. Another tip for managing and maintaining websites is to visit other Navy command sites and talk to other webmasters about what works and doesn't work with their audiences.

MEDIA LAW – As you have learned in this chapter, nearly everything you do as an MC is governed by policies and directives. Yet, in addition to our military regulations, your products are also governed by federal and state laws, which include communications law.

The Constitution's First Amendment states Congress will make no laws abridging the freedom of the press. To the grief of many a publisher and reporter, the First Amendment does not give reporters and editors a free license to print whatever they please.

Free speech and free press, as guaranteed by the Constitution, have two sides: on one side, the right to use them; on the other, the duty not to abuse them. Because your job is to tell the Navy's story, you should become acquainted with defamation laws, the right of privacy and copyright laws.

DEFAMATION, the harming of one's reputation, is typically broken up into two types – libel and slander. Libel is published defamation, while slander is spoken. As it may be clear that defamation printed in a newspaper or on a website is libelous, it may not be as clear when it comes to broadcasted products on television or radio.

Libel laws are state laws not federal laws, thus meaning that what is libelous and how it will be punished is different in each state. In most states, libel is a civil offense and convictions typically result in monetary damages instead of jail time.

Staff judge advocates can assist you in understanding local libel laws. Additional information on media law can be found in the latest version of the [Associated Press Stylebook](#) and Briefing on Media Law. (*Subscription required to browse online version of AP Stylebook.*)

PRIVACY RIGHTS – While the right to privacy is not specifically stated in the Constitution like freedom of speech, it is often regarded as one of our most cherished rights. In 1890, future Supreme Court Justice Louis Brandeis said in the Harvard Law Review that privacy is "the right to be left alone — the most comprehensive of rights and the right most valued by civilized man." The Privacy Act of 1974 gives citizens the right to control information about themselves.

MCs must not violate a person's privacy. Privacy can be violated by disclosure of private facts, if the facts are offensive to a reasonable person and are NOT newsworthy.

More information regarding the Privacy Act of 1974 can be found in SECNAVINST 5211.5 at the Navy [Privacy website](#).

COPYRIGHT LAWS – Copyright is the right of an author, composer, artist, photographer, etc., to own, control and/or profit from the production of his or her work. Copyrighted material may not be republished without consent of the copyright owner, who is not always the author. Facts, historical events and titles cannot be copyrighted, nor can work produced by government employees (MCs included) working within the scope of their jobs.

Generally, copyrights issued since 1978 are good for the author's life plus 70 years, and those issued before 1978 are good for 75 years and are renewable. The Library of Congress contains more information on length of copyrights.

The Fair Use Doctrine legally allows use of portions of copyrighted work without permission in certain instances. These exceptions are:

- Criticism: In reviewing books, television programs, movies and music, portions of the work may be repeated in the review. However, the portions used cannot give away resolution of major plots
- Comment: In commentaries, you may use portions of other works to make or refute a point
- News reporting: At times, a book, television program, movie or song becomes a news item. Relevant portions of the work may be used to support the article

- Teaching: Teachers may use portions of other people's work in their instruction
- Scholarship: Term papers, theses and dissertations may be used; however, footnotes and bibliographies must be used to give credit to these pieces
- Research: This includes documents such as research papers, magazine/journal articles and books produced outside of an academic requirement. Again, remember to use footnotes and bibliographies.

If you have any doubt about copyright or fair use, you should err on the side of caution and receive permission from the copyright owner prior to use. More information and an example template to request copyright permission can be found in [SECNAVINST 5870.4 Copyright](#). Supplemental copyright information specific to public and visual information can also be found in the [Associated Press Stylebook](#) and Briefing on Media Law as well as OPNAVINST 3104.1 (series) (Navy Visual Information Policy and Responsibilities).

SUMMARY

In this chapter, we discussed policies, guidances and directives an MC lives by and should have on hand as she goes about day-to-day operations in support of the Navy. As a reminder, further information on these items can be found on the [DoD Issuances](#) and [DoN Issuances](#) websites as well as on [P-A Net](#).

(This page intentionally left blank).

CHAPTER 4

PUBLIC AFFAIRS FUNCTIONS

Learning objectives: Upon completion of this chapter, you should be able to do the following:

- Discuss the three functions of public affairs and how MCs use each to tell the Navy's story.
 - Explain the types of media and their characteristics.
 - Discuss the Fleet Hometown News Program.
 - Identify the information included in a media query.
 - Assemble a media information kit.
 - Assemble a welcome aboard kit.
 - Discuss steps necessary to escort media.
-

INTRODUCTION

Public affairs can be divided into three functions – internal information, public information and community relations. To be successful in public affairs, you must master all three functions and incorporate each into the command's mission. In this chapter, we will discuss the basics of each function and how they work together to inform our audiences and tell the Navy story.

PUBLIC AFFAIRS APPROACH

Internal information, public information and community relations are directed toward internal and external audiences. As an MC working within these three functions, you must decide what approach you will take when reaching out and releasing information to your audiences. The two approaches are proactive and reactive.

PROACTIVE (PREVENTIVE) - This approach requires you to plan ahead and include the day-to-day activities of the office and regularly occurring events, such as changes of command, tours, distinguished visitor or media embarks, etc. Being proactive adheres to the maximum disclosure policy and is always the preferred approach, as it spells out what needs to be done and identifies opportunities to provide good exposure for your command and your Sailors and Marines. Proper planning is the foundation of successful public affairs.

REACTIVE - This is simply the surprise (often crisis or bad news) situation that cannot be predicted or hasn't been practiced or fully planned. However, a PA shop is better equipped to handle an unexpected crisis if there is a plan in place. There is no substitute for a good crisis communication plan.

All three functions of public affairs are equally important to reaching your intended audiences. You must be familiar with all three functions and how they work in concert to tell the Navy's story. Whether you take the preferred preventive approach or circumstances dictate a reactive approach, timely and accurate information flow is the key to successful public affairs operations.

INTERNAL INFORMATION

Your internal audience consists of active and Reserve Navy and Marine Corps members, Navy and Marine Corps families, civilian employees, contract employees, retirees, and Navy and Marine Corps organizations. The primary internal communication goal is to ensure our people and their families understand they are at the core of readiness and operational effectiveness.

There are six general internal information goals you should always keep in mind:

1. Link Sailors, Marines and their leaders through a free flow of news and information.
2. Help Sailors and Marines understand their roles in the Navy mission.
3. Explain how policies, programs and operations affect Navy members.
4. Promote good citizenship and build pride.
5. Recognize individual and team achievements.
6. Provide avenues for feedback.

There are many ways in which you can "get the word out" to accomplish these six goals. Often the best method is to use as many communication channels as possible for one piece of news. Once you know all of the options, you can best select how to publicize information of importance to your audience.

PRINT PRODUCTS

COMMAND NEWSPAPERS

- Official command or region newspapers fall under the purview of the PAO, your best one-stop adviser for information distribution.
- They reach broader audiences: active duty, families, civilian employees, Reservists, contractors, etc.
- People have had lifelong training at reading and comprehending news. It's far more reader-friendly and personal than official correspondence.
- Newspapers enhance the Navy's and your command's themes and messages with photography and graphics. Visual elements such as photos, graphics and headlines have proven to dramatically improve comprehension.

Command newspapers are produced as two types – civilian enterprise and command-funded.

— The civilian enterprise publication is the preferred type, because it is printed at no cost to the command. Advertising sold by the commercial printer covers the publishing costs. The contract between the command and the commercial printer stipulates the Navy will specify design and layout of editorial content, and advertising will not exceed 60 percent of the space. Additionally, advertising shall not violate DoD equal opportunity directives.

— Command-funded publications do not contain advertising, so they are paid for by the command and printed on base, aboard ship or at a commercial printer. The command owns 100 percent of the layout space.

— The civilian enterprise publisher is typically responsible for distributing a civilian enterprise publication, though official channels may be used. Whether you're distributing a command-funded paper or civilian enterprise newspapers should be placed in high-traffic areas, such as the Navy Exchange, commissary, housing areas, mess decks or break rooms. Newspapers may also be mailed, via third- or fourth-class mail, or made available online for viewing or download.

More information on CE newspapers can be found in the PA Regs and DoDINST 5120.4, Department of Defense Newspapers, magazines and Civilian Enterprise Publications.

FAMILY NEWSLETTERS

Surveys have found the overwhelming majority of Sailors and family members find family newsletters helpful in keeping families informed of Navywide and command information.

- They can be used to ...
 - Transmit information from the command to family members.
 - Inform readers of community and Navy services available.
 - Express the command's interest in the morale and welfare of family members.
 - Encourage, inspire and uplift.
- The benefits of newsletters include ...
 - Reducing misinformation and rumors by providing firsthand, accurate information.
 - Reaching a large number of people at one time.
 - Introduction and establishment of command leadership and the ombudsman as a credible source of information.
- The distribution of the family newsletter can be coordinated with your command ombudsman or family readiness group for the most up-to-date family member mailing or e-mail list. The newsletter can be produced as a hard copy to be mailed, distributed electronically or both. Typically, a newsletter should be no more than four pages, front and back. Some commands now use social media sites in addition to or in lieu of hard-copy family newsletters. We will discuss social media in more detail in the public information portion of this chapter.

PLAN of the DAY/WEEK (POD/POW/POM)

Although this channel is primarily an administrative function, MCs should recognize this medium as a viable avenue for command information. Characteristics of the POD/POW/POM include:

- Designed for short news blurbs.
- Businesslike in tone; good for policy news.
- Acts as the official command voice; it carries weight.
- An excellent way to move information quickly.

— Most effective when combined with other channels, such as command newspapers, welcome aboard packets, and face-to-face meetings such as morning quarters. In doing such, you expound and broaden your coverage.

ELECTRONIC MEDIA

Examples of electronic media include Internet, e-mail, radio, television (shipboard or local closed-circuit), the 1MC, and the telephone.

- *Internet.* The Internet offers PA/VI specialists an interactive means of disseminating information to all audiences. From the Navy's official website (discussed later in the chapter) to command-sponsored websites and social media sites, MCs can upload news, photos, videos and multimedia products as well as static information about their commands and the Navy. The sky is the limit to how MCs can use the Internet. However, in doing such, you must adhere to [SECNAVINST 5720.47](#), Policy for Content for Publicly Accessible World Wide Web Sites.
- *SITE TV.* Your Shipboard Information, Training, and Entertainment Closed-Circuit Television (SITE-CCTV) system is an excellent vehicle for delivering critical information and maintaining crew morale.

— The Direct to Sailor (DTS) program, a satellite-based source of programming, provides news and entertainment on television and radio channels. More information can be found in DoDINST 5120.2, American Forces Radio and Television Service (AFRTS).

— SITE is an excellent system for real-time programming of command events, news and information that can directly impact the lives of Sailors and their families. Use the system's character generator to scroll important Navy, national and international news items during the workday and between movies.

FACE-to-FACE

Morning quarters, captain's calls, division or department head meetings, visits by the CO, formal addresses to groups by ombudsmen or family readiness groups, pre-deployment/post-deployment briefs, and command/department indoctrination are invaluable means of disseminating information to internal audiences. MCs should ALWAYS be involved in these events.

COMMAND EVENTS

Family and Tiger cruises, command picnics, Navy and Marine Corps birthday celebrations, Sailor of the Month/Year events are among the ways in which MCs can get involved to tell the command and the Navy story to many people at one time.

DEFENSE MEDIA ACTIVITY

A number of additional products produced by Defense Media Activity, developed with the guidance of CHINFO, are outstanding outlets to deliver your command's message, tell your Sailors' stories and expand your audience. They are ...

Navy.mil - The Navy's official website is managed and maintained by the Defense Media Activity. It is targeted to the Navy's internal audiences and anyone seeking information about the

Navy. The site includes information on many facets of the Navy, ranging from daily news to digital images of Sailors and Navy events fleetwide. You should use Navy.mil as an information resource and as an outlet to release your command's media products to a wider audience. To upload stories to Navy.mil, your command must use the Navy [management console](#), a password-protected site.

By updating your information in the [PA directory](#) you can elect to receive daily updates from Navy News. The e-mailed updates include the day's stories, photo of the day and a daily historical fact.

All Hands Magazine – In print since August 1922, All Hands is the Navy's flagship publication. Approximately 65,000 copies are distributed worldwide every month with an intended 1:6 copy-to-reader ratio. As an MC, you should ensure All Hands is widely distributed at your command and encourage personnel to pass it along to others when they have finished reading it. For more information about All Hands magazine or to view current and archived editions, visit the [All Hands Website](#).

All Hands Television - Teaming with All Hands Magazine to form the CNO's primary means of informing the internal audience is All Hands Television, a 30-minute monthly feature program produced and distributed by the Defense Media Activity. AHTV reaches Sailors aboard deployed ships and those assigned with their families overseas at remote shore locations. It is also available online at Navy.mil and broadcast on the American Forces Network, commercial television stations across the U.S. and the Pentagon Channel.

All Hands Radio - The flagship broadcast for the U.S. Navy, All Hands Radio is broadcast daily online at Navy.mil and on American Forces Radio stations worldwide.

All Hands News Update - Formerly known as Daily News Update, All Hands News includes six television news packages per day — a two-minute TV package and five, one-minute TV packages broadcast on the Pentagon Channel, American Forces Television and online at Navy.mil. The goal of All Hands News is to tell your story to the fleet and to keep the fleet informed of the best, newest, greatest things going on in today's Navy and Marine Corps. All Hands News Update is a great outlet for broadcasting your command-generated news packages to the fleet. Contact DMA for specific submission guidelines.

Really Simple Syndication (RSS) - Many of the products listed above are also available via podcasts and RSS feeds. These feeds deliver audio and video broadcasts to your desktop or a portable device. Navy podcasts and RSS feeds can be found by following the [Media Resources](#) link on Navy.mil.

PUBLIC INFORMATION/MEDIA RELATIONS

Public information, also known as media relations, refers to the collection, analysis and dissemination of unclassified, official or otherwise releasable information to the public. This is the chief underlying function of all public affairs activities and fulfills the responsibility of all federally funded agencies for accountability to the taxpayers. However, in order to build a strong public information/media relations program, you must establish and maintain credibility.

IDENTIFYING YOUR AUDIENCE

Your ability to effectively communicate hinges on properly identifying your audience and using the most appropriate media type to deliver the intended message. For example, if your audience is a group of World War II veterans, the Internet may not be the best way to reach them.

MEDIA TYPES

Your command should be familiar with the following media types and their requirements to properly coordinate coverage.

Civilian Newspapers - Next to public speaking, newspapers are the oldest medium of mass communication. Despite the growth of television and the Internet; however, many believe newspapers remain the backbone of public information. MCs should understand the significant differences in news coverage that may exist between metropolitan dailies, neighborhood dailies and weekly newspapers in the same locale. Many, if not most, newspapers are now online.

Wire Services - A large part of the news read in newspapers or heard on the air originates from one of several major press associations or wire services. Below are some of the major news services covering international and national news.

- Associated Press – According to the organization's website, the [Associated Press](#) was founded in 1846 and is headquartered in New York. It is a "not-for-profit news cooperative owned by its American newspaper and broadcast members. It serves thousands of daily newspaper, radio, television, and online customers with coverage in text, photos, graphics, audio and video."
- [United Press International](#) – UPI, as it is most widely known, reaches about 2.8 million folks a year via its website. In the business since 1907, UPI provides information to media outlets, businesses, governments and researchers worldwide.
- [Thomson Reuters](#) (more commonly known as "Reuters," pronounced "roy-ters") – Founded in 1851 and headquartered in London, Reuters is a United Kingdom-based news service that provides news, opinion, and analysis.
- Agence France-Presse – AFP traces its history back to 1835 and Agence Havas, which claims to be the first international news agency. [AFP](#) covers the world with thousands of stories daily and is translated into English, French, Spanish, German, Portuguese and Arabic.
- Xinhua News Agency (pronounced "sheen hwah") – Xinhua, which translates to "New China," has provided information about the Peoples Republic of China since 1931. Today, Xinhua translates its news across the world in six languages.
- *The New York Times*, *Los Angeles Times* and *Washington Post* each have their own wire services.
- Gannett is a news service that owns USA TODAY, Navy Times, more than 100 local dailies and has significant holdings in broadcast media.

Fleet Hometown News Center – One of the most successful mediums in getting Navy news to civilian newspapers or on the various wire services is through the Fleet Hometown News Center (FHTNC). Whether you're assigned to a shore command or a deployable unit, one of the most effective ways to recognize your personnel is through Fleet Hometown News. FHTNC stories are used by more than 12,000 hometown news media organizations including newspapers, radio and

television stations and college/alumni publications throughout the United States and its territories. Each year, FHTNC distributes several hundred thousand news releases to these outlets in its effort to build morale and highlight the achievements of hardworking Sailors, Marines and Coast Guardsmen to their family and friends back home.

Newsworthy events for FHTNC release submissions include (but not limited to):

- Reporting Aboard
- Promotions and advancements
- Reenlistments
- Awards and medals
- Marine/Sailor of the Quarter/Year
- Retirements

Although FHTNC releases emphasize the accomplishments and activities of the individual, use of the program is an exceptional way for commanders to educate the American public about a ship or unit deployment, operation, exercise and/or volunteerism.

There are three basic components of the program – [hold files](#), [short features](#), and more-involved [feature stories](#). The latter includes travel by FHTNC personnel travel to your unit to conduct interviews and take photographs. FHTNC uses Navy form NAVSO 5724/1 to gather biographical data for all three components.

In accordance with the Fleet Hometown News program instruction, [SECNAVINST 5724.3](#), any unit or detachment deployed for 45 days or more or deployed in support of a high-level event (Fleet Week, Pacific Partnership, D-Day Commemoration, etc.) shall establish a hold file. A hold file is a collection of FHTN forms completed by individuals in a unit and held in an active status at the FHTNC to generate FHTN releases while the unit is deployed. The unit staff should maintain a copy of the hold file as well.

Coordination with FHTNC should begin 60 days prior to the unit's scheduled deployment, and the hold file should be sent 30 days prior. Milestone information should be verified every 60 days throughout the deployment to ensure accurate and newsworthy information is delivered. FHTNC will maintain the hold file until 60 days after the unit's return from deployment. Hold files for surging units will be kept on file indefinitely.

Program guidelines, hold-file instructions, examples, downloadable forms, and more "how-to" information can be found on [CHINFO's FHTNC website](#). The FHTN program is governed by [SECNAVINST 5724.3 FHTN Program Policy and Regulations](#).

Television – Television combines the impact of image and movement with the immediacy of radio. This makes it the most potent of mass communication media.

Radio - The medium of immediacy, radio broadcasts are faster and less cumbersome than television. Radio is also more accessible to the public than any other medium and offers coverage of a news event as it happens. In some areas of the world, such as Iraq and Afghanistan, the external media is dominated by word of mouth and radio. Listeners can stay abreast of events with little effort. However, radio has no permanence or depth of coverage. Each radio station has its own particular

production requirements. Yet, Navy PA staffs can assist radio station managers in producing news and features on military topics that can be mutually beneficial.

Emerging Media - Social media has grown exponentially in the past few years, and the public's increased use has made this avenue of communication extremely effective in reaching our audiences quickly and personally. In many cases social media sites have blurred the lines between professional and personal networks. Professionalism and adherence to operational security on social media sites must be maintained at all times, whether you're posting as an official command representative or to friends and family in a civilian capacity. Command updates to social media sites are not intended to replace the traditional news release or command website but to provide accompaniment to enhance our stories and reach a different audience.

Operational security should be given the highest consideration when dealing with social media. Social media sites are NOT private. An opinion in the social media realm is an opinion in a public domain. Not only are the public and media there, so are our adversaries. If you wouldn't display and sign your opinion on a placard in a public place, you shouldn't post it in cyberspace. More guidance on social media can be found on the [Defense.Gov website](#) and [CHINFO website](#).

Remember, you must not favor one medium over another; however, you should take advantage of the potential and recognize the limitations of each for circulation, selectivity of publics, influence or prestige, appearance and flexibility in the timing of your products. One common limitation is that coverage does not guarantee public knowledge or understanding of an issue. You cannot expect radio to do a job that is better suited for a newspaper or for a newspaper to do the entire job of communicating in an era when the electronic media have access to virtually all American homes.

ESTABLISHING GOOD MEDIA RELATIONS

Similar to SAPP (security, accuracy, propriety and policy), there are four key words that govern your relations with representatives of the mass media. They are as follows:

- Security -- Make sure the information you release to the media does not contain security violations. In addition to getting yourself in trouble, you may endanger the welfare of your country. You should adopt the slogans "when in doubt, check it out" and "loose lips sink ships"
- Honesty – Your good name (as well as the Navy's) is your most valuable asset and the foundation of credibility. Justify the media's belief and trust in the Navy by playing the news game honestly. Never fake a story or serve a selfish interest. Do an honest, straightforward job of reporting the news. Credit your source, and never plagiarize or use copyrighted material without permission
- Accuracy – Every news release or statement released to the media must be 100-percent accurate. Make one blunder and the media could lose confidence in you. Be sure to check and double-check all statements, names, addresses, dates and numbers. Be sure your personal opinions do not interfere with your media relations. Your job is to tell the facts and tell them accurately.
- Promptness – A good MC aims for speed without sacrificing accuracy. Reporters want their material quickly because competition is keen, and the public demands fresh news.

Media Relations Do's And Don'ts

Building relationships with the media in your area is key to a successful public information program. As in any area of human relations, treat others as you would want to be treated. Be professional. Remembering a few simple do's and don'ts will help guide you, as well as help you set an example for your MC peers.

Do ...

- Be available at all hours
- Tell the truth
- Tell reporters up front if you cannot comment on a particular subject or if the answer is classified
- Get the facts, get them right and get them out
- Be aware of time or space limitations, deadlines or other special requirements
- Know the audience of each medium
- Know the people who work in the media.

Don't ...

- Lie
- Speculate
- Beg for coverage
- Ask a reporter to kill a story
- Be partial in dealing with media representatives for any reason
- Release information to other newsmen that has been given to you by a newsman
- Be a publicity hound.
- Ask news people to slant their copy, withhold information or do favors.

Media Queries

A media query is a request for information made by a reporter, usually by telephone or e-mail, thus indicating that the reporter is looking for a rapid response. To properly respond to media queries, your shop should have a media query form that will walk you through the information you need to gather for the reporter making the query. The form should include the following items:

- Date and time of the media query
- Name of person taking query
- Reporter's name and organization
- Reporter's contact information (phone, fax, e-mail)
- Reporter's deadline

- Subject of reporter's focus
- Background
- Specific question(s) being asked by the reporter
- Desired response (phone interview, written response, visit, etc.)
- PAO point of contact information
- Staffing information
- Tracking number – A media query log will help track and file media queries and responses.

If you receive a query from the media, record as much information listed above as possible. And, do so legibly. As a rule, you should immediately refer the query to your chief or PAO. The PAO will most likely be the authority to release information and is more likely to know the representative calling. When your PAO or chief is not available, you should only answer the query if you have been given the authority to do so and the requested information is releasable and within the limits of SAPP. In most public affairs offices, a set of established ground rules cover responses to routine queries.

However, always keep in mind that the reporter is most likely working against a rapidly approaching deadline. Therefore, if the information is not readily available or you do not have the authority to respond to a query, respectfully explain this to the reporter and promise to call back. Never brush off a reporter with a vague promise, such as, "I will see what I can find out." Be courteous and remember you are representing your command and America's Navy. If you say you are going to get back to the reporter, then get back to that reporter. Your credibility and the credibility of the Navy could be at stake if you do not.

If you receive more than three queries on a particular subject, you should consider sending out the information via an external news release as soon as possible. See Chapter 5 for more information on external news releases.

Media Visits

Members of the media may not only request information via queries, they may also request a visit to your command or simply be invited. In any event, when media visit your ship or station, you will often be tasked to escort them. Media representatives are considered guests of the commanding officer, even when they are covering an assignment. As guests, members of the media are due the utmost courtesy and respect. When you are assigned to escort media, make sure you are prepared. The following items must be coordinated and reviewed with your supervisor, chief and/or PAO prior to the visit:

- Tour route through command – include as many points of interest as possible with security limits
- Interviewees and subject-matter experts
- Times and locations of interviews
- Media information kits.

Once you meet up with the media, you should be relaxed and natural in your actions, and do not try to talk above your level of expertise. If the reporter asks questions you do not know how to

answer, make note of the questions and get back to him or her as soon as possible just as you would with a media query.

If a reporter approaches you for an exclusive, you can work that angle only if the angle is the reporter's original idea. If not, you have to include all other media interested in the subject.

Media Information Kit

The media information kit (also known as a media kit or press kit) is one way to provide visiting reporters with valuable background information on your ship or station. A typical media kit contains the following materials:

- Command historical timeline
- Brief description of the command's mission
- Welcome aboard brochure
- Biographies of CO, XO and/or other subject-matter experts you may have lined up for the media visit
- Multimedia products (photos, videos and graphics may be provided to the media on CDs, DVDs, or a link to a downloadable website where media can find these products)
- Any other appropriate information to supplement the subject on which they intend to write, such as news releases, [fact files](#), etc.

To assemble the items for your media kit, use a standard-size, double-pocket folder. You can arrange the items in a variety of ways, but one common method is to place the static items (command history, leadership biographies, welcome aboard booklet, etc.) on the left and amplifying, event-specific events on the right. Media kits must be reviewed regularly, because the material quickly becomes outdated.

Media information kits serve many other useful purposes, too. For example, you may give them to visiting dignitaries or guest observers during fleet exercises and operations. They are also used during public visitations, commissioning ceremonies and other special occasions. While on deployment, media kits can be forwarded with advance news releases to local editors in ports scheduled to be visited. American officials in foreign countries also need kits for publicity purposes when ships visit them.

Media Lists

An important part of building relationships with the media in your area is knowing what media is in your area. As part of your shop's files, you should have a detailed list of all the media in your area. The list breaks the media into specified groups, such as newspapers, television, radio and social media.

Finding out what media are in your area is not as difficult as you may think. An Internet search for media as well as networking with area MCs and PAOs should set you on the right path to developing your local media list. For each media outlet you should include the following information in your database:

- Name of the organization

- Names of managing editors and/or general managers
- Names of editors, news directors and assignment editors
- Names of military beat reporters
- Names of public affairs directors
- Mailing address, including street, city, state and zip code, for the organization
- Telephone numbers
- Fax numbers. Though fax machines may seem out of date, if the media outlet has a fax number, include it in your listing
- E-mail addresses
- Affiliation, e.g. CBS, NBC, or FOX, if applicable
- Wire service, e.g. Gannett, Reuters, AP, if applicable
- Notes about the organization to include previous articles, tone of articles, views on military, social media involvement, etc.

By having a detailed media list, you will be prepared to contact them for media availabilities or to distribute news releases and media advisories quickly. A news release, also known as a press release, is written correspondence directed at the media to inform them of a newsworthy event, service, product or person. A media advisory is an abbreviated news release that invites the media to cover an event themselves. Newsgathering and newswriting will be discussed in subsequent chapters of this module; however, further information regarding media relations and the release of information can be found in CHINFOINST 5720.8, *PA Tactics Manual*, via [P-A Net](#).

COMMUNITY RELATIONS

Community relations is the third function of public affairs. Also referred to as COMREL, community relations is defined as a planned series of events and activities that fosters communication and understanding between military and civilian communities. It encompasses all official and private contact between the command and its personnel and local communities.

Fostering and furthering good relations with communities at home and abroad is in the best interest of the Navy. A well-planned community relations program will help earn public support and understanding of the Navy's mission and capabilities by increasing public exposure to, and understanding of, military personnel, facilities, equipment and programs. COMREL also works to support recruiting goals and inspires patriotism.

Military organizations should be concerned with community relations because the business of the military is the people's business. Military organizations have a responsibility to report to the public on the conduct of military business. In a democratic nation, the individual citizen has a right to know how efficiently, and to what purpose, his armed forces are employing his sons and daughters and using his tax money -- plus what the returns on his investment are in personal and national security. The effectiveness of military operations depends upon public understanding, support and cooperation.

ELEMENTS of a COMMUNITY RELATIONS PROGRAM

Among the main elements of a community relations program are publics, communication channels and community relations projects designed to accomplish an organization's goals in the community.

Identifying Publics – Collectively, a Navy command's public consists of many groups, both internal and external. As with any community, however, you will find key publics or leaders in the community. To be successful in your community relations program, you should identify and be familiar with these publics. As with the media relations program at your command, your shop should maintain a file of civic and community leaders. This file should include all point of contact information, to include names, phone numbers, addresses, websites, etc.

Internal publics

- U.S. Naval Academy midshipmen
- NROTC midshipmen
- Military auxiliary organizations
- Career civilian employees
- Families

External publics

- The general public
- Community organizations (civic, trade, industrial, veterans, fraternal, youth, women, religious, educational)
- Congress
- Members of committees involved in armed forces matters
- Key governmental officials
- Local government officials
- News media
- Professional organizations
- Well-known local businesses
- Professional people
- Elder statesmen

Community leaders can also be categorized into decision makers, opinion leaders, influentials and the general public. *(Click on links to read Navy news stories that highlight these community members.)*

- Decision makers are elected or appointed officials in the community who vote on issues that may affect the community relations climate. [Mayors](#) and [city council](#) members are examples of community leaders.

- Opinion leaders are community leaders, though not elected or appointed, who still have the power to shape public opinion. They gather a following based on their perspective on a single issue or a group of related issues. An example of this would be school board members, [civic organization leaders](#) and religious leaders.
- Influentials are key persons in the business world. They are the CEOs and chamber of commerce members or other business associations in local community. Click [here](#) for an example of how influentials support America's Navy.
- Possibly the most important external audience is the public – our neighbors, our fellow American citizens, taxpayers and voters. Relationships we build with the general population in [our communities](#) leave lasting impressions.

Communication Channels – Several communication channels are available to carry out a good community relations program. A channel is a method used to reach out to your publics. Of course, we have telephones and Internet, but what about getting out in the public to reach your audiences? Service members' participation in community, church, and athletic and social activities is the most important and effective communication channel. The majority of people in your community will base their opinion of the military on the individuals with whom they come into contact.

Projects and Activities

Projects and activities such as Navy Weeks, installation/ship tours, exhibits, bands, color guards and other planned activities aimed at communicating with the public are essential.

Tours – Navy commands, regardless of their size or mission, generate community interest. For this reason, tours are often an important part of any community relations program, as visitors witness firsthand the Navy in action. The public affairs office is responsible for handling requests for tours, selecting and training tour guides, and planning and coordinating tours.

Just as you will serve as a media escort while serving as an MC, you will also be tasked as a tour guide for your command. As a tour guide, you become the face of the command is imperative you learn as much about your command as possible, but never speak about topics you don't know about. Saying "I don't know, but I will get back to you" is never a bad answer, just make sure you find the answer for the requestor and follow through on your promise to get back with them. The following guidelines can be applied to most installation visits and shipboard tours:

- All hands must be reminded they are representatives of the Navy, and their conduct and attitude are important when conducting tours
- For foreign port visits, ship's company and embarked personnel should prepare for visitors by receiving briefings on local customs and traditions
- "Welcome Aboard" packets or brochures supplement the guided tour. Similar to media kits, a welcome aboard kit typically contains significant events in the ship's history, photographs of the ship, historical and unclassified statistical data, a discussion of the ship's mission and your commanding officer's biography. If foreign port visits are anticipated, packets should be translated

- Explanatory signs or photo boards should be prepared directing visitors through the ship and explaining systems and equipment. When overseas, the signs should be in both English and the host-nation language, if possible. To translate these items as well as items like welcome aboard brochures, the PAO will most likely coordinate with the command's operations department and with host-nation and embassy personnel
- Opportunities should be arranged for local citizens to meet with members of the ship's company to share interesting backgrounds
- An adequate number of selected and trained tour guides or escorts should be selected based on appearance, enthusiasm, ability to be personable and skill in expressing themselves. In all cases, guides should be trained and briefed in advance. A quick inspection of your tour guides' uniforms is a must. Of note, those who speak the host country's language should be used as hosts whenever possible
- Particular care must be exercised when news media representatives are invited aboard in a capacity other than their professional one. They should be treated as news media representatives regardless of their status as invited guests.

More information regarding the coordination and approval authorities for visits and embarkations can be found in OPNAVINST 5720.2, Embarkation in U.S. Navy Vessels. Instructions can be found at the [Navy Instruction Issuances Web page](#).

Participation in Community Events – Military members may support community requests to participate in local events as part of an honor guard, science fair, marching unit, etc. Generally, efforts involving service members, such as joint cleanup ventures or blood drives, are most productive. Support must be confined to activities of common public interest and benefit a local, state, regional or national interest, unless specifically authorized by public law or executive order. When in doubt, talk to your chief or PAO.

More information regarding community relations can be found in the [PA Regs, SECNAVINST 5720.44](#) and the [PA Tactics Manual, CHINFOINST 5720.8](#).

Navy Office of Community Outreach

The Department of the Navy has long realized the importance of community relations as it relates to our overall public affairs mission. The Chief of Information established the Navy Office of Community Outreach (NAVCO) as a field activity to serve as the central point of coordination for Navy community outreach programs throughout the continental U.S. with the exception of fleet concentration areas and the Los Angeles and New York metropolitan areas. The goal of this coordination is to conduct and align national Navy image, awareness and branding efforts by coordinating existing assets for maximum community-relations impact. NAVCO is governed by OPNAVINST 5726.8, Outreach: America's Navy. More information about NAVCO can be found at www.navy.mil/navco/.

The primary means of outreach is through Navy Weeks, which work to bring a concentration of Navy assets and personnel to America's heartland. This is done through programs like the Navy Speakers' Bureau, Navy Band support, Navy Aviation support, Caps for Kids program, media outreach, and namesake visits during Navy Weeks.

- The speakers bureau program is a way of getting your messages to various facets of the local community by sending speakers to talk about their jobs, the installation and its mission. Your installation is full of people with special skills, talents and interests. Civic groups are always on the lookout for speakers. The public affairs staff is responsible for maintaining a roster of speakers, evaluating requests and coordinating speaking engagements
- Military band performances – Military bands can provide patriotic or military music in the local community when sponsored by non-federal entities. However, Navy bands are not allowed to provide background, dinner, dance or other social music at programs held away from an installation. This would compete with local private bands. They can, however, perform their patriotic or military music and can be used to support recruiting activities. More information on the Navy Bands program can be found on the [NAVCO website](#).

SUMMARY

In this chapter you have learned about the three functions of public affairs – internal relations, public information and community relations. Equal emphasis should be placed on all three, because as a junior MC, you'll likely find yourself working with all three, sometimes simultaneously. With proper planning, each function will work to support the other, satisfying each of your audiences and supporting your command's overall public affairs' goals.

CHAPTER 5

INTRODUCTION TO NEWSWRITING

Learning Objectives: *Upon completing this chapter, you should be able to do the following:*

- *Identify newsworthiness.*
 - *Identify the basic elements of a news story.*
 - *Define the ABCs of journalism.*
 - *Discuss the use of attribution in a news story.*
 - *Explain security, accuracy, propriety and policy (SAPP) in a news story.*
 - *Explain process of localizing and rewriting.*
 - *Explain difference in print newswriting and broadcast newswriting.*
 - *Discuss process of copyediting.*
-

INTRODUCTION

In previous chapters, you read about the fundamentals and functions of public affairs. As you learned, MCs serve as internal media and work with external media and communities to tell the Navy story. For these reasons, you must possess strong writing skills and understand the "nature of news," or what makes a situation newsworthy. This allows you to successfully promote issues and events to the media and your audiences.

The exact definition of news varies from one person to the next; however, one common thread is that news is information people want and need. News is written to inform, peak interest or entertain. News is the timely report of an event of sufficient importance that interests a number of people and possesses a combination of elements of mass appeal.

This chapter covers the elements of mass appeal and writing essentials. To understand and employ these skills is to understand how to efficiently and effectively prioritize your efforts as an MC.

ELEMENTS OF MASS APPEAL

As mentioned above, the definition of news changes from person to person. However, what makes news, news remains typically consistent. We will use 10 major element of mass appeal to identify the nature of news here. To help you remember these elements of mass appeal, use the acronym "SPICE COPPS" to identify them. See Table 5-1.

Table 5-1

- | | |
|---------------------|----------------------|
| • Suspense | • Consequence |
| • Prominence | • Oddity |
| • Immediacy | • Proximity |
| • Conflict | • Progress |
| • Emotion | • Sex |

Suspense

You most often see the suspense element presented in a day-by-day or hour-by-hour account of a high-visibility event. Examples are a desperate search for a lost submarine or rescue operations for trapped miners. A news story may not build to a climax the way a mystery does, so it is important that you cite the most important facts first. This practice helps to heighten the suspense of many stories because the ultimate outcome is unknown and is usually revealed through progressive, periodic installments.

Prominence

Prominence is a one-word way of saying "names make news." When a person is prominent, like the President of the United States, almost anything he does is newsworthy. Several hundred civilians may visit your unit in the course of a month without raising a stir. Yet, if one happens to be a state governor or celebrity, you have a news story packed with prominence. Prominence is not restricted or reserved for VIPs. Some places, things and events have prominence. For example, the White House (a place), the Hope Diamond (a thing) and Fourth of July (an event) all awaken interest.

Immediacy

Immediacy is timeliness. An event that has just happened is news. One that happened a few days ago is history. Few events of major significance can stand up as news if they fail to meet the test of timeliness. The key here is to get your story out quickly.

Conflict

Sporting events, wars and revolutions are the most common examples of conflict in the news. Stories that contain this element generally draw the most interest. Man may be pitted against man, team against team, nation against nation or man against the natural elements. Examples are a story about a pilot struggling to land a crippled plane, a coxswain's heroic efforts to keep his crowded boat from capsizing in heavy seas, or Navy taking on Army in the big game.

Emotion

The emotional element, sometimes called the human-interest element, covers all the feelings that human beings have, including happiness, sadness, anger, sympathy, ambition, hate, love, envy, generosity and humor. Emotion is comedy. Emotion is tragedy. It is the interest man has in mankind. Stories following natural disasters often have emotional ties.

Consequence

News of change or news that affects human relations is news of consequence. The more people affected, the greater the news value. A story on the advancement of 2,500 petty officers has consequence within the Navy, especially to those who took the exams. A congressional act that raises basic pay by 2.6 percent for everyone in the armed forces is of great consequence both to the Navy and to the public.

Oddity

An unusual or strange event will help lift a story out of the ordinary. For example, 100-percent advancement to master chief petty officer is definitely newsworthy, considering typical advancement to E-9 is about 1 percent.

Proximity

Readers are interested in what happens close to them. Proximity is the nearness of an event to the readers or listeners and how closely it touches their lives. People are interested news that affects them, their families, their ships or stations, their friends, and their hometowns. If Capt. John Smith of Newport, R.I., relieves Capt. Bill Stone of Charlotte, N.C., as commanding officer of Naval Station Annapolis, it is news in the Annapolis, Baltimore and Washington areas and in the two officers' hometowns. It is not news in Huntsville, Ala., where no one knows either captain or cares particularly who commands a naval station in Maryland.

Progress

In our technologically advanced society, we are interested in advancements in science, technology, medicine, etc. Progress in the Navy may not be as dramatic, but it remains significant to our audiences. For example, an improvement in mooring lines, shoe leather or leave chits can be significant progress. There is a great deal of progress in Navy news stories. The Navy is constantly making progress in seamanship, weapons systems, aeronautics, nuclear propulsion, medicine, habitability, education, human relations, leadership and other fields.

Sex

Sometimes sex is the biggest, single element in news, or at least it appears to be the element that attracts the most readers. Consider all the stories in papers that involve men and women — military, sports, financial news, society and crime. The element of sex, however, ranges from front-page sensationalism to news involving women serving on submarines. Having all Navy Sailors of the year being female definitely fits into this category. One word of caution is be careful not to overemphasize the sexual element unnecessarily as it may be in poor taste for an official Navy release.

THE ABCs of JOURNALISM

Now that you know what makes news, it's time to discuss writing the news. When writing, you should adhere to the basic principles of newswriting, otherwise known as the ABCs of journalism — accuracy, brevity and clarity. By doing so, you will build trust and credibility from your audiences.

Accuracy is a must for spelling, facts, figures, style, grammar, and policy. If the information you're releasing is incorrect in any way, what's the point? People have to trust you to get the news **right**. If you can't, you've lost your credibility.

Brevity is all about keeping it short. Be concise, and eliminate wordiness and redundancy.

Clarity means writing in a way that is understandable to your audience. It's writing at a middle school reading level. It's putting numbers/statistics in context. It's staying away from slang, technical terms or acronyms and abbreviations readers may not understand. Sometimes, it's very easy to forget that not everyone reading your article is IN the military. You should always write with the knowledge that John Q. Public is also a big part of your audience, even for your internal publication.

SAPP

Before you proceed further into this chapter, take a moment and review SAPP, discussed in Chapter 3 of this module. Like the ABCs of Journalism, SAPP is extremely important in your role as a Navy MC. SAPP stands for security, accuracy, propriety and policy. **DO NOT VIOLATE SAPP.**

EDITORIALIZING

The writer's personal opinions should never be injected into a news story – this is called editorializing. The only persons permitted to express an opinion in a news story are those identified in the story itself. Even then, the opinion quoted must be attributed. Attribution will be discussed later in this chapter.

News stories should be written in the third person and facts should be reported as they are found, without personal pronouns referring to the writer.

Consider the following examples of editorializing in straight news copy, then note the following suggestions offered to eliminate the implied opinions:

- **Poor:** Lt. Steven Post is exceptionally well-qualified for the position
- **Improved:** Lt. Steven Post, with a degree in law, has eight years of experience as a legal officer
- **Poor:** An interesting program is planned for tonight at the Officer's Club
- **Improved:** The program scheduled for the Officer's Club tonight includes...
- **Poor:** The punishment was unjust
- **Improved:** The U.S. Court of Military Appeals ruled the punishment imposed by the court-martial was unjust.

ANATOMY OF A NEWS STORY

An internal news story is one of the best ways to get information out to your command as has been discussed. Taking all of the many things you have learned to this point, it's time now to start building a news story. But where do you start?

Inverted Pyramid

Statistics have shown that the average person may only spend about 15 minutes a day reading the news in hard-copy form or online. Therefore, basic news is written in the inverted pyramid style, which means front-loading the most important facts then continuing through the article in descending order of importance.

The inverted pyramid (See Figure 5-1) can be broken into three parts – the **lead**, **bridge** and the **body**. This structure allows readers to get the news they want fast so they can move on to the next news item without missing anything essential.

In addition to meeting the needs of the typical newsreader, the inverted pyramid also benefits editors and publishers. With the average commercial newspaper or online news source containing about 60 percent advertising and 40 percent news, editors and publishers look for ways to save space. So, they cut copy. By using the inverted pyramid, they can delete copy from the bottom up and still tell the story without adversely affecting the reader's understanding of the content.

Figure 5-1, Inverted pyramid.

Lead

The lead is at the top of the inverted pyramid. It is not only the first and most important paragraph of a news story; it is the essence of what you know about the event. It is written crisply and tightly and provides the important facts first.

Along with a headline, the lead brings the reader into the information. Your lead grabs the reader by the collar and screams "READ ME!"

Summary (News) Lead – The most common news lead is the summary lead. A summary lead gives the reader the facts that most clearly and compellingly tell what the story is about, without editorializing or including any unnecessary wording. If you've done your job, the summary lead will draw the reader into the rest of the story, where other details will be provided.

Summary leads contain the five W's and H of the news story – who, what, why, when, where and how. Why and how are sometimes a given or left out when the information is not available. For example, if a helicopter crashes on a flight deck, the initial news story will not have a why element. This is because an investigation into the "why" must be conducted.

A summary news lead is a one-sentence paragraph, 30 words or less. Brevity is important – shorter leads can be hard-hitting – but be certain not to leave out critical information. Another reason for limiting the length of a summary lead is that 30 words equals about one column inch of copy in print. This is long enough for the writer to provide the essential facts, but short enough to keep the reader's interest.

News Peg – A news peg is found in the lead and is the most significant or interesting fact in a story. It is the reason you are writing the news story. Something happened or is scheduled to happen, or there wouldn't be any reason for you to write a story. For example, if there was a fire in housing, then you'd write a story about the fire for the newspaper. The fire is the news peg.

Lead Emphasis – From the news peg comes the lead emphasis – the most important of the five W's or the H. This item is the very first piece of information presented in the summary lead; it

receives the most "emphasized" position in the lead. The key to selecting the right lead emphasis is to remember the reader's point of view and the elements of mass appeal.

Here are some general rules to guide you in selecting a good lead emphasis:

- **Who** or **what** is most commonly used for the lead emphasis, because readers want to know about other people or what they are doing
- If the event affects one person, a **who** lead emphasis works well (e.g., who is receiving an award)
- If the event affects more than one, a **what** lead emphasis would work well (e.g., a concert)
- **When** and **where** are seldom used as lead emphases, because they are rarely as important as the who or what. Remember these items must still be included in the lead
- **Why** and **how** are used only when extremely important or unusual. Most often, **why** and **how** lead emphases are used in follow-up stories after incident/accident investigations are complete.

Impersonal Who – Think back once again to the elements of mass appeal and the nature of a subject's prominence. In newswriting, if you can't be sure your **who** will be easily recognized, you will use an impersonal who to identify that subject in the lead. Full identification of your **who** will then be made in the bridge, the second paragraph of your inverted pyramid news story. The impersonal who contains two primary elements – the person's job title and unit/organization. Here is an example of an impersonal who used in a Navy story:

Georgia governor welcomes Navy week

By Mass Communication Specialist 1st Class (SW/AW) Davis Anderson, Navy Office of Community Outreach Public Affairs

The governor of Georgia welcomed Atlanta Navy Week 2010 with a proclamation ceremony held at the North Wing Rotunda of the Georgia State Capitol building Oct. 13, coinciding with the U.S. Navy's 235th birthday.

During his opening remarks, Gov. Sonny Perdue expressed his appreciation for the Navy.

Dateweek

Before we move on to discuss the bridge of a news story, it's important to take a minute to discuss the "when" element found in the lead. **Dateweek** is the tool journalists use to determine whether they should use the day of the week (Sunday, Monday, Tuesday, etc.) or the month and date (Sept. 12, Jan. 13, April 10, etc.) to tell readers the when of the news event. Although a common practice in some publications, using both the day of the week and the month/date is redundant.

The first step toward understanding dateweek is to remember that it contains a total of 13 days. It doesn't matter whether your publication is a daily, weekly or monthly -- it's still 13 days from one end to the other.

The 13 days of the newspaper dateweek break down like this:

- The day in the center is the day your newspaper gets published (hits the streets to be picked up and read by your audience)
- There are six days before the publication date
- There are six days after the publication date.

The six days before and the six days after the publication date are within the newspaper dateweek for that week's publication. When an event has taken place or is scheduled to take place within that dateweek window, the when of the event is given using the day of the week (Monday, Saturday, etc.). If the event is scheduled for the day of publication, you should use the word "today." Your verb tense lets the reader know the event has happened or is going to happen. Do not use "tomorrow," "yesterday," "next" and "last."

Example (publication day is Thursday, Oct. 21, 2010):

The annual haunted trail opens today at Carr Point and will run each evening through Halloween from 7 to 9 p.m. (Trail opens the day the publication hit the streets.)

The annual haunted trail is scheduled to open Friday at Carr Point. (Trail opens Oct. 22.)

A meeting to discuss telecommuting for Sailors stationed in the Jacksonville area was held Monday in the base auditorium. (Event was held Oct. 18, prior to the publication day.)

The USS Crommelin's Family Readiness Group will welcome new members Nov. 2 during its monthly meeting in the Fleet and Family Service Center conference room. (Scheduled date is out of 13-day dateweek range.)

When writing about something that is happening or happened in a different year, the year should be included. Punctuation of a day, month and year in a sentence is (notice the year is set off in commas):

The U.S. frigate Constitution launched on Oct. 21, 1797, in Boston.

Bridge

After you have written the lead for a story, what do you do next? In some stories, you will find the transition from the lead to the body of the story a bit awkward. To transition smoothly and stay within the inverted pyramid structure, use a writing device known as a bridge. A bridge is a connecting paragraph between the lead and the body of the story.

As with the lead, the bridge is limited to 30 words or less. The bridge builds upon the information found in the lead. You can use the acronym WAITS to determine what kind of information might be important to include in the bridge. A bridge contain at least one of the five elements in the acronym WAITS but will usually include at least two.

- **W** = W's or H not included in the lead
- **A** = Attribution
- **I** = Identification

- **T** = Tieback information
- **S** = Secondary facts.

Five W's and H — As you learned above, the summary lead must contain at least four of the six news elements: **who**, **what**, **when** and **where**. These elements of information are reflective of the first questions a reader will usually ask. The **why** and **how**, if available, are routinely placed in the bridge, because they are usually not considered so crucial that they must be part of the lead. They also tend to be longer pieces of information, which often precludes them being included in the lead.

Example:

- (Lead:) The deadline to update emergency data forms for Sailors here has been extended to Wednesday
- (Bridge:) The personnel office staff wants to be sure all Sailors have the opportunity to update this information.

Attribution – Attribution tells readers the **source** (person) or **authority** (directives, regulations, etc.) from which information was obtained. Because a writer cannot inject his own opinions into news, attribution lends credibility to the information. Attribution is seldom used in the lead, but often appears in the bridge.

Example:

- (Lead:) Male Sailors stationed here will no longer be allowed to wear earrings while off duty, beginning Monday
- (Bridge:) The jewelry has contributed to several fights at downtown clubs, **according to Capt. John G. Jones, commanding officer**, who instituted the policy after consulting with the base legal office.

NOTE: *The writer identified a policy change in the lead. An MC doesn't have the authority to make such changes, so he or she must identify who is setting this policy. In this case, the bridge also contained the **why** element.*

Information that needs to be attributed includes:

- sources of direct or indirect quotes
- statements of fact that are not readily verifiable or facts that are disputable
- information that is not common knowledge
- policy changes
- opinions – professional (doctors, lawyers, governmental experts, police, etc.) or otherwise. Opinions are views, judgments or appraisals formed in a person's mind about a particular matter.

Not everything absolutely must be attributed, however. Generally, you do not need to attribute

- facts that are historically true, such as the year the Battle of Gettysburg was fought (1863)

- facts that are easily verifiable, clearly self-evident, commonplace or clear, such as the fact that in our solar system, Venus is the second planet from the sun.

When in doubt, ATTRIBUTE. Attribution allows the reader to judge the value of the facts based on the prominence/authority of the source. Guidelines for use of quote and attribution will be discussed later in this chapter.

Identification – The “I” in WAITS is identification. This element builds from an impersonal who found in the lead. If an impersonal who is used in the lead, full identification is required in the bridge. Full identification includes the following items (These requirements apply to full identification of sources used in the story body as well):

- Service — if the person is not a member of the host service, identify the person’s service affiliation. For example, if you’re writing for publication on a Navy base, it’s not necessary to identify Navy individuals as being in the Navy. However, you DO have to identify by service any non-Navy service members mentioned in your stories. Example: Army Staff Sgt. Mary Ferguson participated in the training ...
- Rank/paygrade – List rank according to the AP Stylebook (unless the person is a civilian) for external news releases, but follow Navy style for Navy.mil and internal publications
- Full name – Include a person’s middle initial unless person requests otherwise or does not have a middle initial
- Age – If the person is deceased or the age adds interest to the story, it should be included. Releasing someone’s age is not always possible due to privacy issues; ages of the dead are releasable, but ages of the living may or may not be. In some cases, age is considered essential to the story because it has direct bearing on the story’s importance. For instance, if a 27-year-old climbs Mount Everest, it’s not as big a deal as it would be if an 88-year-old did it. In the case of the 88-year-old, it’s essential
- Hometown – Listing the person’s hometown adds marketability to the story. However, similar to listing one’s age, ensure there are no reasons why this item should not be included. Remember Fleet Hometown News.
- Job title – Unless used in the lead, include the person’s job title
- Organization – Same as job title above.

NOTE: *Be very careful not to confuse job title, rank/paygrade and service. Each is a completely separate type of identification. "Coast Guard" is not a job title, it's a service. "Petty Officer 2nd Class" is not a job title, it's a rank/paygrade.*

Once a person has been fully identified, use only the last name in subsequent references unless there are two or more people with the same last name mentioned in the story.

Example:

- (Lead:) A journalism instructor at the Defense Information School was named Fort Meade Sailor of the Quarter in a ceremony Tuesday at the post’s Club Meade.
- (Bridge:) Navy Petty Officer 1st Class Dwight J. Evans teaches basic videography for the Basic Mass Communication Specialist Course.

- Tieback – This newswriting device brings the reader up to date on past and present events. It is a short recap frequently is used in follow-up stories.

Example:

- (Lead:) The Canadian icebreaker MacDonald, with the help of U.S. icebreakers Glacier, Staten Island and Northwind, is free from the arctic ice pack that threatened to maroon it until next summer
- (Bridge:) MacDonald was making the trip back from the research station ice-island T-3 when it began experiencing difficulties in the polar ice.

Secondary Facts – Secondary, but significant, facts serve as a transition from lead to body. The bridge is often used to give the reader information that is significant, but not important enough to be placed in the lead. Since the bridge often amplifies the lead with attribution and identification, secondary facts are often part of this paragraph.

Example:

- (Lead:) Most of Naval Station Newport was without electrical power for three hours after Tuesday's thunderstorm
- (Bridge:) In addition to downed power lines, several trees were uprooted, and considerable damage to mobile homes was reported at the post trailer court.

If well written, you could theoretically print just the lead and the bridge without depriving readers of any vital information; note how many newspapers use "news briefs" that are only two or three paragraphs in length.

Body

To produce a smooth, final story, the lead, bridge and body must coincide. The body is the detailed portion of a news story that develops and explains the facts outlined in the lead and bridge. Here again, the importance of a neatly tailored lead cannot be overemphasized. A cumbersome lead is most often followed by a cumbersome body. But when a lead has done its job, it provides a blueprint for the orderly organization of facts in the body of the story.

Guided by the idea of news importance, the writer proceeds through the story by selecting the next most important incident, fact or detail, then the next important, and so on, until reaching the least important of all. At this point, the writer has reached the apex of the inverted pyramid with material of least value. The writer now knows that the editor can slice one, two, or three paragraphs from the bottom of his story without depriving the reader of the story's chief news elements. The table below shows a diagram of a straight news story structure.

SUMMARY LEAD	A Navy officer who had never before taken control of a single-engine aircraft brought an Air Force spotter plane in for a rough, but-successful landing Oct. 12 at Eglin Air Force Base.
FACT 1 (bridge)	Lt. John G. Smith of Jackson, Miss., walked away from the emergency landing only "slightly shaken up," said Air Force Col. Arnold Phillips, Eglin's senior medial officer.
FACT 2	The incident came about after the pilot, Capt. Fred Johnson, 28, died of a heart attack during a routine training mission over the Gulf of Mexico in an area 60 miles southwest of the base.
FACT 3	A former enlisted man, Smith served as an aerial photographer for several years and credits his general familiarity with aircraft in helping him land the plane.
FACT 4	Presently assigned to Eglin as a Navy liaison officer, Smith reported to his present duty station in July 2009.

A hard news story doesn't have a formal conclusion. It just ends when you run out of information that pertains to the story. Remember, after the lead and the bridge, all or part of the body should be easy to cut without losing valuable information; that's the beauty of the inverted pyramid.

Organization is the key. Answer the questions that are most important to the readers first. And produce in the body what you promise in the lead: if the lead says the story is about a fire, then you must restrict the body of the story to giving information only about that fire. Always include all available information that does not violate security, accuracy, policy or propriety. It is not your job as a reporter to decide what gets cut and what does not; that's the editor's job. If you've written the story in inverted pyramid style, nothing truly important will be lost.

Tips for writing the body:

- Don't bury important information in the body. Never assume readers will get that far into your story
- After the lead and bridge, stick to "one idea per paragraph" construction, but break up paragraphs that get too long (three sentences per paragraph is about the max)
- Keep sentences short: 30 words or less works all the way through a news story
- Keep sentences simple: whenever you can, use subject-verb-object structure. That doesn't mean you will never use passive voice. Considerations such as the correct lead emphasis may force you to write a passive-voice sentence
- Use easy-to-understand words and phrases. Write to EXpress, not IMpress!
- Use strong, active, accurate verbs, but be careful with adjectives. Do not editorialize
- Be specific and accurate. Is he a sergeant or a technical sergeant
- Avoid repeating facts
- Smooth out your writing by eliminating words that do not add meaning. Remember brevity
- Don't use the same word to start every sentence/paragraph. A commonly repeated beginning word is "the"
- Use vivid quotes to liven up the story
- Let the editor decide what to discard, but if a quote or phrase is speculative and/or lacks authority, throw it out.

Using quotes – Quotes should not only be used in the bridge but also in the body of the story. They add variety, authenticity and a "voice" to the news. Unfortunately, some reporters don't attribute the spoken word correctly. They think they can just put quotation marks around anything they like, or toss in an opinion and not mention the source of that information.

When using quotes, remember this very basic, but important, rule: Direct quotes are verbatim spoken words or to-the-letter published material. Anything else is paraphrased, or indirect, information.

NEVER fabricate a quote or alter a quote and leave it in quote marks, not even to fix someone's grammar. Doing so is the same as altering a photograph (as you will learn in Module 2): it is *unethical* and *dishonest* because it is changing the facts. *It is not a journalist's job to change the facts, but to report them.*

Use quotes sparingly and only when they are memorable. Quotes set off controversial material, helping fortify a point and highlighting language.

Quote abuse is one of the most common problems in journalism. Beginning journalists tend to quote material that doesn't say anything unique. For instance, if you quoted the commander saying, "*The duty day runs from 0730 to 1630,*" you would start losing your readers. This type of quote is neither memorable nor effective. It's common, easily verifiable information.

A good rule for knowing when to use quotation marks, according to successful freelance writer Art Spikol, is to "Use them to set off revealing, significant statements -- not to give statements significance."

Direct Quotes – A direct quote states EXACTLY what a person said, EXACTLY the way he or she said it, and it appears inside quotation marks:

"Our graduates serve both soldiers and the American taxpayer," said Hobson. "The public's interest must be our interest. There is no excuse for fiscal irresponsibility; the public won't accept it, and neither should we."

Direct quotes must never be altered, for any reason whatsoever. If a quote is too "bad" to use verbatim because of grammatical errors or for other reasons, paraphrase and run it as an indirect quote.

Indirect Quotes – When you change the words someone said while leaving the meaning intact, the result is an indirect quote, or paraphrasing. Quotation marks are NOT used with indirect quotes:

School graduates serve both soldiers and the American taxpayer, said Hobson. "The public's interest must be our interest. There is no excuse for fiscal irresponsibility; the public won't accept it, and neither should we."

When paraphrasing, make absolutely sure you ARE NOT changing the meaning of what the person said. If you do, you have not reported the facts accurately.

Partial Quotes – When you use some, but not all, of a direct quote, you're using a partial quote. Only the portion of the quote that's used verbatim should appear inside quotation marks.

Direct Quote: "For 50 years, we have tried to provide the Army with finance officers who can move tanks, troops and mountains with their comptroller skills," Hobson said. "That's the power of the

purse string in today's Army. We need finance officers who can handle the task fairly and with fiscal responsibility."

Combination using partial quotes (underlined for training purposes): For 50 years, the school has worked to provide Army officers who can "move tanks, troops and mountains with their comptroller skills," said Hobson. "That's the power of the purse string in today's Army. We need finance officers who can handle the task fairly and with fiscal responsibility."

Partial quotes should not be used frequently. If you use them at all, try to limit them to one or two per story, maximum. Usually it's better to use a direct or indirect quote than to resort to a partial quote, but they can be used occasionally for variety.

Here's why:

- People begin to wonder what you're omitting -- and why
- Partial quotes can be hard to read and interpret
- They interrupt the normal flow of a sentence.

Tips for using quotes (reiterating from the information above):

- Don't let quotes tell the entire story. Sprinkle them throughout. Don't "slosh" them everywhere
- Provide the quote itself before the attribution most of the time, because what is said is more important than who said it. Mix it up occasionally only for variety's sake
- Keep the person's name and the attributive verb together
- Correct example: "...," *said Carlton F. Fisk, a civilian machinist*
- Incorrect example: "...," *Carlton F. Fisk, a civilian machinist, said*
- Don't use words such as "thinks," "feels," "believes," etc., as attributive verbs; "said" is the best attributive verb for ANY type of attribution
- Be consistent with attributive verb tense: use either past tense (said) or present tense (says) throughout, but not both in the same story. Past tense is preferred. (This applies to other verbs in the story, too)
- Use first-person personal pronouns (I, me, we, our, us, etc.) only in direct quotes. If you paraphrase a quote, you must change personal pronouns to words such as he, she, they, them, etc
- When you begin to quote a new person, begin a new paragraph. Mixing quotes/information from two or more people in the same paragraph causes reader confusion
- When mixing direct and indirect quotes in the same paragraph, place the attribution with the direct quote. Never leave a direct quote hanging without attribution
- NEVER alter a quote and still use quote marks — not even to "fix" grammar problems. *However, punctuation is fixable as long as it does not change the meaning of the quote*
- NEVER FABRICATE A QUOTE. Your job is to report the news, not make it up.

EXTERNAL PRESS RELEASES

The information above outlines the anatomy of a news story. This structure is geared toward internal news releases, but the information is also applicable to externally released products. **External releases** are sent to external news media for dissemination to the American public.

Before you send an external release to the media, be sure to carefully evaluate the information's news value and related it to the external audience. By doing so, you stand a better chance of having the release used by the media.

News/Media/Press releases

The primary difference between the internal news stories written for your command publication and the external release written for the news media is the **audience**.

External releases are used to send stories outside your internal audience area. Most public affairs offices have release forms and established formats. While form styles and formats may differ from shop to shop, the information is released basically the same way.

Types of external releases

Hard news external releases fall into four general categories:

- "Kudos" stories feature hometown stories or award ceremonies. (Do not release proposed awards)
- Announcement stories feature contract awards, public safety announcements, gate closings, exercises and their impact on communities, etc
- Public event stories feature public visitation, tours, changes of command, etc
- Accident/incident releases inform of accidents/incidents involving military assets, including people and property.

Note: An external release can also be a feature story. You'll learn more about features in Chapter 7.

Datelines

A dateline is a journalist tool unique to external releases. It tells the reader where the story originated (was written). It does not necessarily tell where the news event happened, which is why we often use words like "here" as the where element in leads.

Datelines must be used on all releases sent to external media. You should also find them on stories received from outside sources. The reason for this is to make sure the reader understands the story was not written at your unit but was filed or submitted from another source. Commonly, you will see datelines from Navy News Service, Army News Service, Air Force Print News, Navy Exchange Command, etc.

Datelines are not needed for internal stories you generate that will appear in your internal publication.

A little history: Before modern technology, when news took days to travel across the Atlantic or across the country, the date the story was written was much more in doubt than it is today. Therefore, the date the story was written appeared in the dateline — hence the name. Today, the date is usually within 24 hours and can be easily determined by reading the time reference in the lead (date-week). So while we still call them datelines, a more accurate description might be "placelines." You may still see dates in datelines in news sites on the Internet, but they are not commonly used elsewhere.

Format – Datelines are written in a specific format to ensure consistency throughout the media. The dateline is found at the very beginning of the news story in the same paragraph as the lead. It consists of a city and state or city and country, and is followed by a dash – a dash, not a hyphen. The city is written in capital letters, while the state or country is not.

Some cities, both nationally and internationally, are prominent enough, however, that the state or country is not needed. These cities are identified in the datelines entry of the AP Stylebook. For releases sent to Navy.mil, Great Lakes, Norfolk, San Diego, Pearl Harbor and Arlington stand alone as well due to their strong Navy ties.

EXAMPLES:

NEW PORT RICHEY, Fla. — Navy Junior Reserve Officers Training Corps (NJROTC) units from schools throughout Florida gathered to compete in personnel inspection, drill, color guard, academics and athletics at the 3rd annual Mitchell Mustang Stampede at J. W. Mitchell High School, Oct. 16.

NEW AMSTERDAM, Guyana — The Continuing Promise 2010 (CP10) Partnership of the Americas mission aboard USS Iwo Jima (LHD 7) dropped anchor just off the coast of New Amsterdam, Guyana, Oct. 17.

The local angle

The lead for an external release differs from an internal news lead. One of the 5Ws or the H is still used for lead emphasis, but the information is evaluated and applied a little differently. In an external release, you must establish two things. The first is the **local angle**.

- The local angle lets an editor immediately recognize why the story is important to his audience
- The local angle is the lead emphasis; it will be the first few words of the lead, immediately following the dateline.

Say you are in Peoria, Ill., and you see a story with a lead that reads (*Original article edited to be used as an example:*)

PEARL HARBOR — The director of the Universal Picture's movie "Battleship" hand-picked a Sailor assigned to the aircraft carrier USS Ronald Reagan (CVN 76) to be a part of the movie while it was filming at Joint Base Pearl Harbor – Hickam on Sept.13-14.

Petty Officer 2nd Class Jane L. Sailor was playing soccer for a U.S. Navy team during a Rim of the Pacific (RIMPAC) 2010 sports game last July when the director, Peter Berg took notice of her and wanted her to be part of the movie as an extra and a military technical advisor to Rihanna.

Why would the audiences in Peoria care about this news story? By reworking the release a bit, you can target the article to the Peoria audience.

PEARL HARBOR — A 1992 graduate of Peoria High School, currently serving as a gunner's mate aboard the aircraft carrier USS Ronald Reagan (CVN 76), was hand-picked by the director of the Universal Picture's movie "Battleship" to be a part of the movie while it was filming at Joint Base Pearl Harbor-Hickam on Sept. 13-14.

Petty Officer 2nd Class Jane L. Sailor playing soccer for a U.S. Navy team during a Rim of the Pacific (RIMPAC) 2010 sports game in July when the director, Peter Berg, took notice of her and hired her to be the military technical advisor to Rihanna.

Military tie

The second necessary item in an external news lead is the **military tie**. This is the public relations side of PA. If you don't have a military, or Navy, tie to the release, you have no reason to send from your PA shop. The military tie explains to the editor why it is coming from your command on your news release letterhead.

In stories about individuals, the individual's job title (or rate/rank) and unit often double as the military tie. In these cases, the military tie is often set off by commas:

PEARL HARBOR – A 1992 graduate of Peoria High School, currently serving as a gunner's mate aboard the aircraft carrier USS Ronald Reagan (CVN 76), was hand-picked by the director of the Universal Picture's movie "Battleship" to be a part of the movie while it was filming at Joint Base Pearl Harbor-Hickam on Sept. 13-14.

The rest of the lead

Remember, whether a lead is for internal or external publication, you must still ensure:

- It contains a who, what, when and where (at a minimum).
- It is one sentence, 30 words or less.
- It contains an external dateweek.

An external dateweek for external releases you send out is figured the same way as for an internal release, **but the publication date is different**. The publication date for an external releases is the day the release is sent to the media. This date is also found in the header of the release (more to follow on release headers). When you use the word "today" in an external release, it means the date on the release.

The date on the header must be correct. If you put the wrong date on a release and use the word "today" in the story, you have created a major error in fact.

External release header

The template used by your shop for external releases is at the discretion of the PAO. However, the header of your choice must contain the command's name and address, point-of-contact information, a release number and release instructions. Recipients of the release will need this information if they have follow-up questions or concerns. One word of caution when creating your template: Using

your command logo or creative graphics is discouraged as these items are typically large and will clog people's inboxes.

NEWS RELEASE	
COMMAND ADDRESS COMMAND NAME PHONE/EMAIL	DATE OF RELEASE
RELEASE NUMBER/YEAR (#1-10)	RELEASE INSTRUCTIONS [FOR IMMEDIATE RELEASE OR EMBARGO UNTIL (DATE HERE)]
HEADLINE Byline DATELINE – NEWS LEAD BRIDGE FACT FACT ###	

Release Number – News releases should be tracked for accountability and cataloging purposes. Most shops use the number, hyphen, year format. In the example above, the release number, #01-10, identifies that the release is the first release for 2010. Traditionally, hard copies of releases were logged and kept in the office. Today many shops keep only electronic copies.

Release Instructions – Most of the external releases you send will be "FOR IMMEDIATE RELEASE," which means you want the media to use the information right away. Another option is to use "EMBARGO UNTIL <date>", telling the editor to hold the information until the date specified. Keep in mind, editors and journalists are under no obligation to honor an embargo. Some shops use "hold for release" vice "embargo until."

External Release Bridge/Body

Rules and guidance for writing the bridge of an external story remain the same. The bridge should be kept to one sentence, 30 words or less.

In the body of an external release, you will again use the inverted pyramid style of newswriting. The difference is the audience and the organization of the remaining facts. What is important to a military audience may not necessarily be the same with an external audience. Therefore, the order of the information should be arranged to include any local angle information up front. When organizing your facts, ask yourself what impact each has on the reading audience. Don't leave out information; just arrange it differently if necessary.

All releases, internal and external, should end with a code to let the reader know that there is no additional copy. Historically, the codes "XXX" and "-30-" have been used. "XXX" originated during the Civil War when copy was sent over telegraph lines. It is also the Roman numeral for 30, thus inspiring the "-30-" ending. Modern press tends to use "###," while many Navy commands use "USN."

MEDIA ADVISORY

A media advisory is an abbreviated form of a news release intended to encourage the media to cover an event themselves. The news advisory is normally no more than a page in length and includes a compact-description of the event. Pertinent information, such as the date, time, location, specific details, and the significance of the event, also should be included. You may disseminate the news advisory in the same manner as a news release.

This is an example of an advance story. When constructing an advance story, you must develop strong local angles, noting events or items that will be of particular interest. The inverted pyramid structure is appropriate for the advance story. Consider the elements of mass appeal when you are formulating your lead. Emphasize the magnitude of the story or stress the unusual, depending on the topic. The lead will generate interest by stating the most notable parts of the event first.

As with all public affairs products, planning is key. Schedule your advance stories appropriately, ensuring that you give the media adequate time to plan coverage. However, don't exploit the event and always ensure the event is a legit one.

ACCIDENT/INCIDENT STORY

Accidents and incidents happen in the Navy, and Navy MCs play a key role in informing the public during these times. As mentioned in earlier chapters, the principles of information guide us to release as much information as we can with a minimum time delay. The goal for releasing an initial accident story is one hour with coordination with all other pertinent persons at your command.

The initial release is written as a hard news story with some exceptions. The initial release will leave many unanswered questions, because within one hour of such an event, much may not be known. However, you should be able to gather basic information:

- A dateline
- Initial number of killed and/or injured
- Brief description of the accident or incident, to include the what, when and where
- A next-of-kin statement – "The names of the dead and injured are being withheld pending notification of next of kin"
- Information regarding search and rescue operations
- A statement of investigation. "The cause of the accident (incident) is under investigation."

You must ensure no information is released that violates privacy rights of surviving service members or their family members. Home addresses must never be released.

LOCALIZE AND REWRITE

In the external release portion, you learned that in a PA shop you not only send out news stories, but you also receive releases from outside sources. Before you publish this information, you must localize and/or rewrite the release to meet the needs of your audience. The principles of localizing and rewriting are the same as those for newswriting. The following are six reasons for localizing and/or rewriting:

- To localize general information
- To improve poor copy
- To update material
- To transform informal reports into properly written news stories
- To combine two or more stories
- To change story emphasis.

Once you identify a story that may be of interest to your readers, it's time to begin the localization and rewriting. Localizing straight news stories means gathering facts about the local news peg, writing a lead that emphasizes the local angle, then providing the other details (both local and nonlocal) in descending order of importance. Localize by gathering information from local sources, subject-matter experts at your command who can help tell how the story affects your audience.

For example, when the Navy released information about the rolling out of the new working uniforms, MCs fleetwide contacted local uniform shops and command leadership to find out when the uniforms would be available in their area and what local policies would be set regarding the wear of the new uniforms.

Attributing sources – Readers want to know the source of the material they're reading, so they can trust in it. So, be sure to credit the news service material you localize. You can do this by including a tagline at the end of your story. For example: (Information from a Navy message was used in this story.)

Remember that just because you are crediting the news release does not mean you will always use all of the information verbatim. The majority of the information will be rewritten and reorganized to best serve your audience.

Quotations – Direct quotations from the original news release, however, should be used verbatim, but make sure you accurately adjust the source's identification information for use in your publication. For example, in a news release with a Washington dateline, a source identified as Navy Capt. John J. Smith, the director of emergency services here, should be rewritten to properly ID where Capt. Smith is located. In your updated article for a Norfolk publication, you would list him as Capt. John J. Smith, the director of emergency services in Washington, D.C.

FOLLOW-UP STORY

A follow-up story is one that ties back to a previous story and informs the reader of the most up-to-date information. A follow-up story is only released when new information is available. For example, information received about a Sailor previously listed as missing has been found calls for a follow-up story.

When writing the follow-up story, the new information becomes the lead emphasis and a new lead is written surrounding this information.

Original release:

NORFOLK – A search is underway today off the coast of Cape Hatteras, N.C., for a USS Mitscher (DDG 57) Sailor who was reported missing today after not showing up for a 12:15 p.m. muster.

Follow-up story:

NORFOLK – A Sailor assigned to USS Mitscher (DDG 57) was rescued at 5:40 p.m. today after spending five hours in the water off the coast of North Carolina.

The Sailor, whose identification is being held pending the notification of his next of kin, was reported missing following a 12:15 p.m. crew muster.

If you are following up on an accident story to identify people who were killed or injured, you must ensure that all next-of-kin notifications have been made and you meet the 24-hour requirement. The names of the killed and injured are typically found in the bridge of the story. However, if 10 or more people were involved you may want to consider waiting until the end of the release. No matter where you place the information, it is important to list the individuals in alphabetical order.

SPORTSWRITING

The straight sports story is no more than a straight news story about a sports event. The same rules for accuracy, brevity and clarity apply. The summary — although it contains seven elements — should summarize the story.

- Who played whom
- What sport did they play
- What was the score (who won)
- Where did the event take place
- When did it take place
- How was the contest won (last-second field goal, etc.)
- What happened.

EXAMPLE:

MUNCIE, Ind. (AP) — Junior Chandler Thompson poured in 32 points and hauled down 14 rebounds to lead the Ball State Cardinals to their 14th straight victory, a 78-61 rout of Nebraska, in college basketball here Saturday.

In the **bridge**, you should provide a solid transition into the body. It can introduce information about the significance of the contest or add supporting facts.

EXAMPLES:

The victory improved the Cardinal's record to 21-5 and marked the third straight year they have won at least 20 games.

OR

Thompson, a 6-foot-4 forward with a vertical leap of 44 inches, has now scored 30 or more points six times this season and grabbed 10 or more rebounds 11 times.

The **bridge** in the second game story can tie back to the earlier game by recapping how game one was won. With the significance of the outcome, don't wait until the bridge to tell readers someone won the championship. This must be in the lead.

EXAMPLE:

- (Lead) Three-hit pitching by Toby White sparked Naval Station Norfolk's Sharks to a 4-1 triumph in Game 2 and a championship win over Joint Expeditionary Base Little Creek's Gators in Hampton Roads' slow-pitch softball action Wednesday night at D.B. Sailor Memorial Stadium here.
- (Bridge) In Game 1 on Tuesday night, Sharks shortstop Tom Theodonis led the lineup with three hits, including a three-run home run, giving the Sharks a 5-4 win.

The **body** should provide detailed information, inverted pyramid style. However, a new writer or non-sports fan may not be able to distinguish most important to least important, so chronological order can be used until the writer becomes more familiar with the sport.

Common sense - and that really is what sportswriting is -- should dictate what details are included. In **football**, scoring plays usually are relatively infrequent. So, you probably should mention each one, usually in a one-or two-sentence paragraph.

In **basketball**, on the other hand, individual scoring plays are numerous. To recount how every point was scored would require a small booklet. The story, consequently, should include key scoring plays and a listing of collective scoring contributions for both teams.

True sports fans greatly appreciate a **box score**. Sports fans are statistic-oriented, and the more statistics, the better. A box score is usually added at the end of the story in bold type smaller than regular copy type.

The **sports headline**, like its straight news counterpart, is a "superlead" condensed summary of who-beat-whom-by-how-much. Usually there isn't room to get into the How element in a headline, but if the room is there, it makes for stronger headline content. *(We will talk about headlines in a subsequent chapter of this module.)*

Sharks clip Gators 7-6

Unlike many other areas of potential coverage, there's usually a lot more sports at the average installation than the newspaper has the staff to cover or the space to print. So some selection process is necessary.

Your unit, for example, probably has six to 12 slow-pitch softball games on tap Mondays through Thursdays during the softball season. To cover each game with a story and photos would require a huge sports staff and many pages of copy. A better idea is to select a weekly game or two to cover in complete story forms.

Criteria for picking the games might include consequence (a meeting of two undefeated teams or even two winless teams) or prominence (the defending unit champions against last year's runners-up).

Other games can be covered by publishing results in "line score" form. Included at the end of the synopsis could be the schedule for upcoming weeks.

Some knowledge of the sport you're going to write about is necessary. No matter if you are a sports' fan or not, research of the subject should be conducted before heading for the ball diamond or gym. Read the news, check out the sports chapter in the AP Stylebook, and watch television to learn about sports.

The guideline for coverage is the newspaper audience. If enough people at your command participate in an activity, they deserve space in the sports pages. If someone relevant to the readership wins a marksmanship contest, races go-carts, runs the Boston Marathon or once played against LeBron James, that someone is an excellent subject for the sports page in the form of a feature.

Whatever the sport, enough research material is available to enable the writer to write a good story. Remember, the sports story is just a straight news story about a sports event.

Sports verbs

The basic sports story is about someone losing and someone winning. To make that worth reading, sports writers and their editors have developed synonyms without end for **win** and **lose**. Still, working against a deadline, writers are likely to go with a handful of old favorites. Some guidelines and an incomplete glossary of accumulated sports slang below may be helpful in preventing such embarrassments.

- Avoid kill, murder, assault and the like. These are serious criminal offenses and are not appropriate for describing sporting events
- Take care with names that have other meanings: O'Rourke crucifies St. Paul
- Intransitive verbs need no object and make shortest heads
- Be precise. When the score is 4-2, the verb is not smash, slaughter or skunk.

— **WIN**: win, rip, nip, axe, bag, top, set, get, nail, lead, trim, beat, best, clip, down, dump, fell, lead, lick, post, sink, slam, whip, score, upend, topple, defeat, subdue, sew up, outrun, deliver, advance, overhaul, overcome, outclass, pull off/down, outpoint, outfight, knock off/out/over, clinch title, turn back, polish off, advance on/over, nail down (a championship).

— **CLOSE WIN**: nip, trim, clip, snip, edge, squeak, slither, hold off, eke/edge/nose out, outlast, stagger in, squeeze by/through, come from behind.

— **SURPRISE WIN**: foil, halt, stun, upset, shock, stupefy, surprise, roll/turn back, overturn, bring to a halt (a winning streak).

— **EASY WIN**: push/walk over, coast past, romp/waltz/breeze in, romp/waltz home.

— **BIG WIN**: zap, ruin, whip, drub, romp, rout, bury, blast, sting, whomp, crush, wallop, riddle, smash, whack, wreck, punish, roll to/over/post, thrash, squash, sweep, shellac, dazzle, plaster, clobber, explode, mop up, humble, burn up, overrun, trample, flatten, ca-

kewalk, triumph, triumph over, humiliate, trounce, clean up, annihilate, slaughter, pulverize, wipe out, mow down, massacre, bulldoze, steam-roll, romp/bowl/trample over, overwhelm, overpower, embarrass, exterminate, walk/climb all over, run/walk away with, give a plastering/shellacking/trimming.

— **PREVENT SCORING:** zip, ace, deny, sack, blank, skunk, choke (off), shut off/out/down, hogtie, whitewash, paralyze, goose egg, short-circuit, scuttle.

— **TIE:** ("ed" verbs need two subjects) tie, draw, break even, stalemate, deadlock. Also: even series at, break even with, deadlock with.

— **FAIL TO SCORE:** draw a blank, lay a goose egg, blanked, shut off/out/down (Use suitable verbs from PREVENT SCORING list and make passive).

BROADCAST WRITING

As an MC your first encounter with broadcast writing will be as a radio or television newswriter or the editor of an electronic newsgathering package. In one of these assignments your job will be to meet the deadlines and rigid standards of the electronic media with the Navy's news story.

Radio news style is dictated by the need for grabbing and holding the attention of an audience. When scripting broadcast copy, you will face many subjective choices that can only be made by using your own common sense. For copy to serve any worthwhile purpose, it must be the kind of news story or radio spot the individual radio stations in your geographical area desire and are able to use.

Initially, be aware that writing for broadcast media is not the same as writing for print media. While the same rules of SAPP apply, there are a number of differences, particularly in writing style. Broadcast copy is written and designed for the ear, so the listener becomes involved and feels as though he is a part of the event being reported.

Each line of broadcast copy, or 10 words, equals approximately four seconds on air. Therefore, you will need seven to eight lines, on average, to produce a 30-second piece.

THE SIX C's

Broadcast copy must measure up to the following six C's: Clear, Concise, Complete, Conversational, Current and Correct

Clear

Clear copy is written in a simple, easy-to-understand manner. It is developed in a logical way, flows smoothly and is easy for the listener to follow. Even the simplest story may be misunderstood on the basis of one's hearing. The listener's attention may be divided between any number of distractions. Therefore, a radio news story should be perfectly clear to avoid misinterpretation.

In broadcast writing, simple words say it best. Choose words that everyone will understand—the announcer as well as the listener. Do not ignore colorful or descriptive words. However, steer clear of flowery phrases and clichés that simply take up time and are of no value. Avoid slang and always translate military, technical, legal and foreign terms into simple language.

Concise

Avoid jamming too many thoughts or numbers into one sentence. Generally, sentences that are more than 25 words contain more than one thought and should be rewritten into separate sentences. The same principle applies to dependent and independent clauses. They are often very cumbersome, so write them as separate sentences. You have concise copy when all unnecessary words have been trimmed away and only those words essential to convey your thoughts remain.

Complete

For the broadcast story to be complete, you must include in it at least four of print journalism's five "Ws." You will normally state what happened in your lead sentence, to whom it happened, when it happened, and where it happened. Why and how generally are not critical, although to be complete, some stories will require this information.

Conversational

Like good conversation, broadcast writing is informal and free-flowing. Write the way you talk. Let the story tell itself. Conversational tone sounds "right" to the audience and allows the announcer to easily decipher the idea of the story. Do not include hard-to-pronounce words or combinations of words that are awkward to the ear. Also, rid your copy of words that might be unfamiliar to your listeners.

Current

News of a perishable nature is usually hard news. If you have a story of immediate news value, you should expedite its completion and delivery to the media. By the same token, if there are new facts or circumstances relevant to your initial release, a follow-up story should be provided (and marked as an update). The new or changed elements of the story should be identified to reduce possible confusion with information in the original release.

Correct

The hallmark of writing, whether print or broadcast, is the accurate presentation of facts. Your finished product must correspond accurately with the facts of the story. In the field, you will follow every possible lead to get the facts as well as report them.

BROADCAST COPY FORMAT

When writing broadcast copy, start with a general "what-happened" lead followed by a body of significant facts. This body of information does not have to include all the facts of the story, since including the who, what, where, when, why and how in the lead would be too cumbersome. The lead sentence must gain the attention of the listeners and orient them on the facts that will follow in the body of the story.

When you begin a story with a person's name or a number, you risk the possibility of that information escaping your listener. It is much better to say, "A San Diego Sailor was cited for heroism today," than to say, "Seaman Phillip Jones was cited for heroism today." Start the story with a general "what happened" lead; then mention the recipient by name.

Names and Titles – In the case of names and titles being used together, titles should precede names. It should be "San Diego Mayor Jerry Sanders" not "Jerry Sanders, San Diego Mayor." Alert your listener to whom you are about to name by prefixing the name with the person's title.

You should refer to federal office holders by title or as "mister." For example, you would use "President Obama" or "Mr. Obama," "Mr. Biden," or "Vice President Biden," "Senator Sanders," or "Mr. Sanders."

If a difficult name is unessential, use only the person's title, such as "The Ambassador from Nigeria ..."

Initials – Generally, it is better to omit middle initials unless it is a well-known part of the person's name, such as William F. Buckley or John F. Kennedy. In the case of former president George W. Bush, using his middle initial is crucial so that he is not confused with his father, former president George H.W. Bush.

Words – In broadcast writing, you must be aware of certain categories of words that are potential trouble areas. These categories are explained in the following text.

- **Contractions** – In day-to-day conversations, contractions are used liberally. Therefore, you should use contractions whenever possible to add to the "conversationality" of your broadcast copy
- **Pronouns** – Using personal pronouns in broadcast copy can cause confusion. When you use "he," "she" or "they," make certain there is no doubt in the listener's mind to whom you are referring. The ear cannot go back and pick up the identification. Repeat the noun if there is any question
- **Alliterations** – Beware of alliterations. When you compose a sentence consisting of several words beginning with the same vowels or consonants, you have alliteration, and the announcer may have a problem. For example, "**THE WESTERLY WIND WHISTLED WILDLY.**"
- **Sibilants** – Beware of too many sibilants, or "s" and "sh" sounds, as they tend to create a hissing sound when read aloud
- **Phonetic Spelling** – If you are concerned about mispronouncing names and places, you can limit the possibility by writing the phonetic spelling of the word in parentheses immediately following the troublesome word. For example: **CAPTAIN ANTOINE (AN-TWAN) SPOKE TODAY ...** The Associated Press online offers phonetic spellings and pronunciations of items of news interest
- **Numbers** – Numbers present special problems to the broadcast writer. For the sake of clarity, broadcasters have developed their own style with numbers. Any number that begins a sentence is always written out
- **Conversational Numbers** – Make numbers conversational. Round out figures unless the exact figure is essential to your story. For example, \$1,527 would become 15-HUNDRED DOLLARS. However, exact numbers must be used if your story deals with deaths or other subjects requiring exact statistics
- **Dates** – Write dates as **OCTOBER 1ST, 2ND, 3RD, 4TH** and **31ST**, and use four-digit numerals for years, such as **1979** or **1994**.

BROADCAST COPY STYLE

The most successful broadcast writers write the way people talk in their daily conversations. They write as if they were telling the story to a friend. As an experiment, start noticing the lengths of sentences used in normal conversation. You will even find that we do not always talk in complete sentences. Quite often we speak in fragments, especially if everyone engaged in the conversation is familiar with the subject matter.

Uppercase vs. Lowercase – Broadcast copy is written in all capital letters or uppercase and lowercase. There are merits for each style. We are used to reading in uppercase and lowercase, and the patterns of words are easier to distinguish. If both uppercase and lowercase are used, you can also use caps for emphasis. However, the wire services use all caps and the all-capital style conforms to that format. Your job is to determine the best style for your releases and use it. Sticking to one style only, within the context of a story, also is important. Be consistent!

Present Tense – Using the present tense in broadcast news gives the copy an air of immediacy and it gives the listener a sense of participation. However, the verb tense that is most natural to a situation will be the most effective. Every story does not have to sound as if it happened the moment before the newscaster went on the air.

Active Voice – Write your broadcast copy in the active voice. Active voice provides impact, which is extremely important to a broadcaster. Passive voice can weaken the impact of a sentence. Look at the following example:

MILITARY POLICE SEIZED THE EVIDENCE. (Active)

THE EVIDENCE WAS SEIZED BY THE MILITARY POLICE. (Passive)

Do not confuse the active voice with past tense. The active voice can apply to past, present and future tenses. Active voice does not necessarily mean the present tense! Subject-verb-object is the best indicator of the active voice structure.

Punctuation – Punctuation in broadcast writing is used to help the announcer read the copy aloud.

The Period – The period indicates the end of a sentence or thought. More periods are used in broadcast writing because broadcast writing sentences are generally shorter and more conversational.

The Comma – Use a comma to indicate a pause shorter than that of the period. Do not use a comma unless you want the announcer to pause.

The Hyphen – Use the hyphen to help announcers in phrasing difficult words and to instruct them on how to pronounce individual elements distinctly. Note the following examples: RE-ADJUSTED, RE-EVALUATE, CO-OPERATE, RE-ALLOCATE, W-C-O-A, F-B-I, Y-M-C-A

COPYEDITING

Learning how to write for publication or broadcast is only the beginning of telling your story. Before you send copy to your editor, you have to check and recheck your work. This is called copyediting. The ability to copyedit is the cornerstone of all public affairs products – your command newspaper, a news release for the external media, public affairs guidance, the unit website or any other

product your shop produces. Every time you produce a product, you are putting your credibility on the line – your credibility with your commander and your customers, those who use your product.

When the paper looks bad and contains a lot of errors, the trust is gone – both from your commander and all of your various audiences. Stories are harder to come by because potential sources are afraid to talk to you. When you need subject-matter experts to brief the news media or handle a tour through their units, they may be less inclined to support.

You need to learn to write in a manner that conveys what you want to say quickly and clearly. To do that, you need to be able to copyedit.

Helpful tips when copyediting:

- When submitting your copy for editing
 - Put your last name on the draft at a minimum.
 - Include "more" at the bottom center of each page; "30," "USN," or similar command-specific notification at the bottom center of the last page. This lets the editor know to expect more or not when he reaches the end of each page.
- Try reading and copyediting the text using a step-by-step method
 - Read copy once without making any changes.
 - Read copy backward, focusing on the spelling and usage of each word. When you find a synonym, you will need to read the sentence forward to ensure proper usage.
 - Read the copy forward, sentence by sentence, checking for errors in grammar, punctuation and logical flow.
 - Read one more time for missed errors.
 - Send to editor.
- Read out loud
- Copyediting is employing a combination of good English skills and simple common sense. Put punctuation where it belongs, remove unnecessary punctuation, eliminate wordiness, make sure sentences make sense, and watch for misspellings, typos and other errors. If the story sounds good when you read it aloud, you are on the right track
- Copyediting isn't easy for everyone though. If you do not have a natural eye for errors in grammar, spelling, punctuation, style, etc., you may want to ask someone else to copyedit your story. However, you should copyedit the piece as well, and then compare notes. This helps you hone your copyediting skills as well as your writing skills
- Do not copyedit immediately after you finish writing your story, put the story down for a bit and come back to it to copyedit. Give your mind a rest.

Before you sit down to copyedit, it is imperative that you have a dictionary, the AP Stylebook, a copy of the Navy Style Guide, your local style guide if you have one and other supporting references with you. This will ensure you are consistent in your copyediting.

To help you with your copyediting, here are a few grammar and style rules you won't necessarily find in the AP Stylebook.

Editorializing

To report news accurately, you must keep yourself detached from the story. Whether you are doing interviews, writing your story, or conducting research, you must keep your objectivity throughout. Your job is present unbiased facts. When you are copyediting, always check for lack of objectivity and editorializing. Don't forget attribution!

Word Choice

Word choice (also known as syntax) in your writing goes hand-in-hand with accuracy, brevity and clarity as well as with SAPP. Therefore, the words you choose should not leave any doubt in your reader's mind as to what you are saying, nor should they offend or confuse your readers. This is especially true when writing an accident story or a news feature following an incident, accident or tragedy. Some important word choice examples:

- Death may occur following an operation or during an operation, but not as a result of an operation. The latter implies negligence
- Accidents happen and explosions occur; neither "takes place," because they are not scheduled events
- Ultimately, everyone dies of heart failure, not of a heart ailment
- A fire is not a conflagration; it's a fire. A bruise is a bruise, not a contusion, etc.

In addition, watch for wordiness and passive sentences. If you see a sentence that begins with "there is," "there are," or "it is," take a second to see if you can rewrite. For example:

- **Unnecessary** – There are some recent movies that have become classics already
- **Better** – Some recent movies have become classics already.

Contradictions

Sometimes a writer may contradict himself and not even realize it. For example, what if an MC wrote about a Sailor's recent promotion to E-4, referring to the Sailor as a 16-year veteran? With today's high-year tenure regulations, a Sailor should not be a 16-year third class petty officer. This could have been a typographical error or misinformation. Either way, as the copy editor, you should find inaccurate facts such as this.

Incompleteness

With experience, an MC will be able to gather all the facts necessary to tell the story. As the copy editor, it is your job to ensure the writer answered all the pertinent questions. Remember the 5 W's and H, and read the story as if you are the intended audience. If the MC failed to answer ques-

tions you have, chances are your readers will have the same questions. Return to the MC to complete the story at this time.

Proper Names and Figures

As discussed several times throughout this manual, accuracy is the key to being a good reporter of facts. The copy editor is counting on the writer to have proper names spelled correctly. But, how do you know that the name IS spelled correctly? One helpful method to ensure accuracy and avoid confusion is to have the writer draw a box around the name and make tick marks with his or verification of each properly placed letter. This works for statistical data as well. Better safe than sorry!

Spelling

Mentioned above in your list of "gotta-have" references to have available during copyediting is a dictionary and your style guides. These are a must, because spelling rules have many exceptions, and spell check doesn't always catch misspellings. Knowing a word's correct pronunciation will help you when you are looking up the word as well.

Punctuation

Punctuation serves the same purpose in writing as voice inflection does in speaking. Proper phrasing avoids ambiguity, ensures clarity and often lessens the need for unnecessary punctuation. The AP Stylebook contains a thorough section on punctuation. You should have this section bookmarked and study it often. Mastering punctuation will go a long way in any writing you do for the Navy.

Capitalization

Knowing what to capitalize and what not to capitalize is also specific in newswriting. Again, the AP Stylebook and U.S. Navy Style Guide are important tools to help with capitalization.

Acronyms and Abbreviations

One of the chief complaints of civilian editors and Navy family members who read military news is the excessive use of abbreviations and acronyms for titles and organizations. Acronyms and abbreviations (making a word or phrase shorter by leaving out or substituting letters) are used throughout the military and are necessary when trying to keep your writing brief. Some titles and terms are so long that abbreviation is a must. However, on first reference most acronyms and abbreviations must be spelled out. The AP Stylebook and Navy Style Guide contain abbreviations and acronyms and rules to whether they must be spelled out on first reference. A local style guide is important for your internal audience as well. Remember, brevity is important, but so is clarity.

Sentence Structure

Words, sentences and paragraphs are the building blocks of writing, and to be a good writer you need to know how to use them to build your stories. Each must be well chosen, effective and grammatically correct with a goal of clarity, emphasis and interest.

Sentence Fragment

Sentence fragments are incomplete sentences. For a sentence to express a complete thought, it must contain two necessary parts – a subject and a predicate (or verb). It is possible, however, for the subject to be understood, but you should be sure in such cases that the subject is clearly defined.

An incomplete sentence often results from the writer's failure to recognize that a modifying phrase or clause is really part of another sentence. For example, "The cruiser was headed east. Steaming through the Caribbean."

As a copy editor, however, you may not be aware that the writer, especially in feature writing, is using a fragment purposely, purposely for effect. In this case, the writer should leave a message for you that he or she is doing that.

Run-on Sentences

Another common error in sentence structure is the punctuation of two or more sentences as if they were one. This usually occurs with sentences that are closely related in thought. For example, "The ship's crew had its first swim call, the water was four-miles deep." These are two completely separate thoughts. "The ship's crew had its first swim call. The water was four-miles deep."

Dangling Modifiers

A writer's misplacement of a modifier will confuse the meaning of a sentence, often with silly results. Modifiers should be positioned close to the words they modify; otherwise, they may seem to modify something else. This error is common when using participles with other adjectives or with ab-verb modifiers.

For example, "Returning to the ship, the package was found on the bunk." In this example, you are saying the package was returning to the ship. A better way would be to say: "Returning to the ship, he found a package on his rack."

The word "only" is also often misplaced. By moving the word around in a sentence, you can change the sentence's meaning.

- Only he could read the unfamiliar dialect (Nobody else could?)
- He could only read the unfamiliar dialect (He could not write or speak it?)
- He could read only the unfamiliar dialect (He couldn't read other dialects?)
- He could ready the only unfamiliar dialect (Only one dialect was unfamiliar?).

Misplaced Correlative Conjunctions

Correlative conjunctions, such as not/only, but/ also and either/or, are often misplaced. The correct position is just before the words or groups of words they are connecting.

- **Misplaced** – The Navy letter form not only omits the salutation but also the complimentary close
- **Correct** – The Navy letter form omits not only the salutation but also the complimentary close.

Other frequently used correlative conjunctions are *both/and*, *neither/nor* and *whether/or*.

Split Infinitives

Before you can understand what a split infinitive is, you need to know what an infinitive is. An infinitive is a verb paired with the word "to," like to leave, to run, etc. A split infinitive, then, occurs when you add an adverb between the word "to" and the verb, *to quickly leave*, *to vigorously run*, etc.

Although many editors stand true to not splitting infinitives, some believe it is necessary for emphasis. Best rule of thumb, however, is to hold to tradition and keep the adverb out of the way.

Errors in Agreement

As you have read in this section, a sentence is a complete thought when it contains a subject and a verb. This subject and verb must agree with one another in number. For example, if you have a singular noun, you must pair it with a singular verb; with a plural noun, a plural verb.

- A Sailor runs
- Sailors run.

In a compound subject with "and" as the connector, the sentence takes a plural verb. When you use "or" or "nor" as a connector, the verb should agree in number with the last noun in the subject.

- The propeller and shaft were damaged
- Neither the propellers nor the rudder was damaged
- The cat or the dog sleeps on the back porch.

Again these are simple, sentence-construction examples. Most errors in subject-verb agreement occur with more complex sentence structures that contain more than one noun. Many writers mistake a noun not acting as the subject as the verb, because the noun is the closest in proximity.

- **Incorrect:** The primary duty of the staff dental officers are very similar to that of the district dental officer
- **Correct:** The primary duty of the staff dental officers is very similar to that of the district dental officer.

NOTE: *The subject here is "duty," therefore, the subject must be singular.*

In addition to errors in subject-verb agreement, many writers have trouble with noun-antecedent agreement. A pronoun is a word we use to take the place of a noun (he, she, it, they, we, us, them, etc.), and a pronoun functions as a noun. The replaced noun is the antecedent. The antecedent controls what number (singular or plural) of pronoun you use.

Collective nouns and pronouns cause error in agreement as well. Collective nouns are nouns that refer to things or people as a unit. Examples are family, class, teams, crew, etc. Collective nouns can be used in both the singular form and the plural form. Singular collective nouns refer to one unit of people or things; they take a singular verb. Plural collective nouns refer to two or more units of people or things, and they take plural verbs.

If you are unsure of a sentence's subject-verb or pronoun-antecedent agreement, break the complex sentence down to its foundation and take it from there.

Gerunds

When a verb ends in "-ing," it may be a gerund or a present participle. It is important to understand that they are not the same. When we use the -ing verb like a noun, it becomes a gerund: Fishing is fun. When we use the -ing verb as a verb or an adjective, it is usually a present participle:

- John is fishing.
- John has a boring teacher.

The above-mentioned items are but a few grammar and style issues you will run into when writing and editing. Get into your stylebook, your dictionary and other grammar and punctuation handbooks to help hone your skills.

Copyediting vs. Proofreading

Copyediting as mentioned above is the tedious, but important, job of going word-by-word, sentence-by-sentence, through text to ensure adherence to SAPP and the ABCs of journalism. This process takes place following production of the product, before it is sent to the publisher to be set.

Proofreading, on the other hand, is the final check after the article has been set into publication. Traditionally, proofreading was done during review of newspaper galleys (proofs not yet made into pages). Final corrections for typos or errors get a final look here.

Today, these words are often used synonymous. Overall, they have the same purpose of ensuring accuracy.

Copyediting/Proofreading Marks

When copyediting or proofreading your work or the work of a Shipmate, corrections are made by using copyediting or proofreading marks. Most copyediting marks are universal across newswriting lines. On the next page, you will find one example of copyediting marks; however, the AP Stylebook offers another example. Following the copyediting marks, the last page of the chapter contains a chart of proofreading marks from [Merriam-Webster](#). Whatever marks your shop decides to use, keep them consistent. Refer to Figures 5-2 and 5-3.

Copyediting Marks

SYMBOL MEANING	EDITED COPY	EFFECT
Insert quotes, apostrophe	"We believe..."	"We believe..."
Insert exclamation point, question mark	Wow!	Wow!
Delete punctuation	white) and blue	white and blue
Transpose letters	captain	captain
Transpose words	run fast	fast run
Transpose sentences, paragraphs	Apply same principle as above, or circle first item and draw arrow to desired position; note with (1)	
Abbreviate or spell out	Doctor Dr. ninety-two 92 more	Dr. Doctor 92 ninety-two
More of story to come		
End of story	-30-, -end- or -un-	
Not a new paragraph	battle. Sailors are	battle. Sailors are
New paragraph	battle. Sailors are	battle. Sailors are
Correct as written	Jane Austen	Jane Austen
Let it stand as before corrected	the F-14 Tomcat	the F-14 Tomcat
Center in column (heads and subheads)	Navy Day	Navy Day

SYMBOL MEANING	EDITED COPY	EFFECT
Capitalize	north island	North Island
Make lower case	the commander	the commander
Make caps and lower case	JOHN PAUL JONES	John Paul Jones
Insert letter	news stories	news stories
Change letter(s)	action photo	action photo
Delete letter, close up	typewriter	typewriter
Delete letter, leave space	petty officer	petty officer
Insert word	news photos	news and photos
Change word	record pictures	record pictures
Delete word, close up	news worthy	newsworthy
Delete word, leave space	the men	the men
Insert space	news photos	news photos
Close up	news paper	newspaper
Insert period	the end. The	the end. The
Insert comma, colon, semicolon	three, four and	three, four and
Insert hyphen	re-enter	re-enter
Insert dash	fact--for example	fact--for example

Figure 5-2, Copyediting Marks.

PROOFREADERS' MARKS

Symbol	Meaning	Example
↵ or ♂ or ¶	delete	take it out
⊞	close up	print as <u>one</u> word
⊟	delete and close up	close up
^ or > or ˆ	caret	insert here <i>(something)</i>
#	insert a space	put on [#] here
eg#	space evenly	space [^] evenly [^] where [^] indicated
stet	let stand	let marked text stand as set
tr	transpose	change / order the
/	used to separate two or more marks and often as a concluding stroke at the end of an insertion	
[set farther to the left	L too far to the right
]	set farther to the right	too I far to the left
ˆ	set as ligature (such as)	encyclo ^ˆ pædia
≡	align horizontally	align [≡] ment
	align vertically	 align with surrounding text
x	broken character	imperf ^x ct
□	indent or insert em quad space	
¶	begin a new paragraph	
SP	spell out	set <u>5 lbs.</u> as five pounds
cap	set in CAPITALS	set <u>nato</u> as NATO
sm cap or s.c.	set in SMALL CAPITALS	set <u>signal</u> as SIGNAL
lc	set in lowercase	set <u>South</u> as south
ital	set in italic	set <u>oeuvre</u> as oeuvre
rom	set in roman	set <u>mensch</u> as mensch
bf	set in boldface	set <u>important</u> as important
= or -/ or ⌵ or /M/	hyphen	multi-colored
¼ or en or /N/	en dash	1965–72
¾ or em or /M/	em (or long) dash	Now—at last!—we know.
ˆ	superscript or superior	2 ^ˆ as in π ²
ˆ	subscript or inferior	2 _ˆ as in H ₂ O
◊ or ×	centered	◊ for a centered dot in <i>p · q</i>
⸣	comma	
⸢	apostrophe	
⸣	period	
⸣ or ⸣/	semicolon	
⸣ or ⸣	colon	
⸣ or ⸣	quotation marks	
(/)	parentheses	
[/]	brackets	
OK/?	query to author: has this been set as intended?	
↓ or ⊥ ¹	push down a work-up	an unintended mark
⊞ ¹	turn over an inverted letter	inve [⊞] ted
wf ¹	wrong font	wrong si ^{wf} ze or styl ^{wf} g

Figure 5-3, Proofreaders' Marks.

SUMMARY

In this chapter you learned about taking the fundamentals of public affairs you read about in previous chapters and applying them in writing for publication or broadcast. You also learned that strong writing skills are essential to a successful career as a Navy MC or as an editor of others' work. In the next chapter, we will move from the news story to accompanying items – headlines and captions.

CHAPTER 6

WRITING HEADLINES AND CAPTIONS

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- *Recognize the functions, components and attributes of a headline.*
 - *Write a headline.*
 - *Identify components of a photo caption.*
 - *Write a photo caption.*
-

INTRODUCTION

You have just delivered a story to your editor that is the best you have ever written with accompanying imagery that is some of the best you've ever taken. However, the story and imagery might vanish into obscurity on any newspaper or Internet page if the accompanying headline or caption does not entice or inform the reader. Headlines serve to grab the reader's attention and to quickly find the stories of interest to them. Photographs have unique storytelling abilities, but that story can often be lost without a caption that allows your reader a glimpse behind the scenes.

In this chapter we will discuss the elements of headlines and captions and how each enhances your media products.

HEADLINES

Headlines use words to sell a story and a variety of sizes and shapes to gain the reader's attention and improve publication design. Some headline writers use varying type fonts, sizes and forms to create a visual impact your eyes can't miss.

Headlines are powerful tools you simply cannot neglect. They set the tone for your entire publication (and, therefore, your entire unit or organization).

In a print publication, headlines set the look for the entire paper. Headlines are sometimes as important for how they make the page look as for what they say; they dress up a page, catch the readers' eyes and make it look and "feel" more accessible.

Just as the inverted pyramid helps emphasize the important information up front in news and allows readers to decide if they want to or need to keep reading, the news headline tells readers what the story is about quickly and in as much detail as space will allow.

CATEGORIES

Headlines fall into three general categories: straight news, feature and editorial.

(SIDENOTE: Features will be discussed in a subsequent chapter, while editorials will be taught in the advanced manual due out late 2011. However, to give you a quick peek into editorials,

they are similar to arguments in court cases. They give commanders and readers a chance to present policies and arguments in a structured, professional manner.)

Summarize the story: Even before the lead, the headline provides a general idea of the story to the reader. Straight news story headlines tend to be written "straight" – no fluffy stuff – while feature, news feature and editorial headlines can and should be more creative, catchy and enticing.

- **Attract attention/advertise the story:** A headline helps the reader skim a page and pick out what's important to him or her. Swallow your ego; this is reality. People typically read only what they find interesting. So, if you know it's important for them to read, give it a headline that highlights why it's important to them. Here are some examples:

— *Vague: Tuesday's open forum draws 315*

— *Better: Commander: 'I'll fix the sewer problem'*

- **Dress up the page design:** Headlines add bold, dark accents to what otherwise may be dull, gray pages. Feature headlines, in particular, may add a bit more. When creating feature headlines, you should explore different fonts and font treatments as a departure from the "everyday."

HEADLINE WRITING PROCESS

Read the story: The first step to writing a good headline is to read and understand the story. Remember, you're not writing a headline based solely on the lead; you're writing a headline for the entire story. The headline must give readers an idea of what the story is about and what kind of story it is: breaking news, humorous feature, personality profile or so on. Nothing misleads readers or angers writers more than a headline that misses the point.

Summarize the story: Once you've read and edited the story completely, summarize it into one sentence – a focus sentence. The sentence must have a specific subject and an active verb, and it must show how this particular story differs from every other.

Telegraphic English: When writing headlines, articles (a, an, the) and conjunctions are not used, because they take up too much space. The whole point is to say as much as you can in the space provided. So if you have lots of space, why is it wrong to use them? Because there is usually a better way to reword the headline to include more and better information than what is communicated by a conjunction that adds no meaning. It's a question of disciplined use of the headline space, and it makes for much better news headlines. Contrary to Associated Press style, headlines also call for using numbers in all cases and abbreviating days of the week and months. This shorthand way of writing headlines is called telegraphic English.

- Wrong: A fire destroys a house and a garage
- Right: Fire destroys house, garage
- Wrong: A gunman kills three at a school
- Right: Gunman kills 3 at school.

Headline style: From the focus sentence, you then eliminate unnecessary words such as forms of the verb to be (is, are, was, and were), leaving on the action verb to tell the story. Headline verbs are always in the present tense to show immediacy and to put the reader in that moment. This

is known as using historical present tense. If the event has not yet occurred, infinitives, the "to" forms of verbs, are used to indicate future action:

- Past: School cadre builds global relations
- Future: School cadre to build global relations
- Verb Usage.

For headlines to pack a lot of punch, the writer should use **accurate, dynamic** verbs and avoid using past tense and passive voice. If faced with passive voice, change the subject and focus on a different grammatical angle. For example:

- Passive: President killed by gunman
- Active: Gunman kills president.

Try to use SUBJECT - VERB - OBJECT construction. Historical present tense is one way to avoid past tense. **Future tense** – Congress to raise military pay.

- PAST TENSE: Fares dropped by airlines
- HISTORICAL PRESENT TENSE: Airlines drop fares
- PAST TENSE: Airplane crashed, killed 2
- HISTORICAL PRESENT TENSE: Airplane crash kills 2.

Punctuation

Again, as mentioned above, AP style and grammar are often not followed when writing headlines. This is also true for punctuation. Below are some basic guidelines.

Periods are not used at the end of a headline, but they may be used for abbreviations:

- N.C. town welcomes Fleet Week

Commas may be substituted for "and"

- Sailors make history, promote to CPO

A semicolon is used instead of a comma when a headline contains two complete thoughts (two subjects and two verbs).

- Judge suspends trial; defendant goes free

A colon may be used to indicate "said" or to create a pause for effect

- Obama: Bin Laden must go
- Chesty Puller: Not an average Marine

Quotation marks set apart direct quotes, as well as jargon quotes that are tossed around by the experts. Always, to save space, use single quotation marks.

- CVN 77 welcomes new 'fun boss'

- Lincoln: 'The war has begun'

Other types of punctuation, such as exclamation points, question marks, etc., should be used sparingly and only when necessary.

Headline Style

Many of the headline guidelines above run consistent from media outlet to media outlet; however, one thing that does vary is uppercase vs. lowercase style. The three main styles are downstyle, uppercase/lowercase and all capital letters.

"Downstyle," regular uppercase and lowercase letters used in standard sentences, is preferred and easier to read than capital letters, while uppercasing all major words takes a lot more space. However, some publications, to include Navy.mil and The Washington Post, use the uppercase method, or all caps. Regardless of the style you choose, it should be consistent with the rest of your publication.

- Downstyle: Brother and sister to reunite aboard Truman
- Uppercase: Brother and Sister to Reunite Aboard Truman
- All Caps: BROTHER AND SISTER TO REUNITE ABOARD TRUMAN.

Abbreviations and acronyms

Abbreviations save space in headlines; however, you should avoid acronyms whenever possible – especially unusual ones. Remember, your newspaper or online publication will have shadow audiences who may not understand military jargon. Use only abbreviations the general public would understand. Otherwise, the headlines indicate to your shadow audiences that the paper is an in-house newsletter and doesn't apply to them. Also, don't clutter up a headline with more than one abbreviation per line.

Bad splits

Headlines may spread over more than one line in print publications, thus running the risk of creating a bad split, a strange pause or phrase. The end of the line is a place where the reader naturally pauses; it's almost like inserting commas in a sentence. One way to keep from having a bad split is to not separate an adjective from the word it modifies or a preposition from its subject. If you wouldn't logically put a comma at the location of the split, it isn't a good place to split.

Wrong:

- Commander wants 'pot'
- program to be tough

Right:

- CO calls for change,
- Tougher 'pot' program

Types of Headlines

Although there are three categories of headlines, there are **many** types and variations of headlines. Here, we will discuss some of the more common ones. All variations are viewed in terms of their visual impact when used with basic headline styles. Some of these variants are explained in the following text.

Standing Head – A standing head (See Figure 6-1) is a label used for regular or recurring content, such as sports and chaplains' columns. It does not change from issue to issue.

Figure 6-1, Standing Head.

Jump Head – A jump head (See Figure 6-2) helps the reader find a portion of a story continued from another page. The jump head uses one or two keywords from the headline that introduced the story. It is set flush left followed by the words "Continued from Page ##" and usually set in italic type. A two-point line may be used to extend from the side of the head over the width of the article.

Figure 6-2, Jump Head.

The jump line is the line of text that appears at the point where the story has been jumped to another page. The jump head is the headline on the remainder of that story.

Overall, jumps are best avoided. Most readers do not "follow the jump" and finish reading the story; it's simply too much trouble. USA Today, a paper that prides itself on ease of reading, allows only one story per front-page section to jump into the paper.

Drop Head – Also called dropout or deck, a drop head (See Figure 6-3) is another headline below the main headline. The drop is smaller than the main headline, gives additional information and stands alone as a secondary headline.

Think of the main headline and the drop head like the lead and bridge of a story. The main line is similar to the story lead as it holds the most important information. The drop is like the bridge in that it complements the main headline without repeating the information.

Figure 6-3, Drop Head.

Crosslines – A crossline runs across more than one column. A banner headline, spoken of below, is a type of crossline.

Banner – Banner headlines (See Figure 6-4) give major news events their required importance. They are typically aligned left (flush left) and span across three or more columns of text. Modern newspapers overuse banner headlines, so they don't command the instant attention they once did. Too many banner headlines lead to a boring publication, so these headlines are often combined with drop headlines and limited to one every page or so at most.

Families affected by flooding advised to complete assessments

BY BRUCE MOODY

Commander, Navy Installations Command, Navy Family Readiness Program

WASHINGTON, D.C. — Navy personnel affected by the recent flooding in Tennessee are encouraged to communicate their needs and update their current contact information using the Navy Family Accountability and Assessment System (NFAAS). NFAAS is found at <https://www.navyfamily.navy.mil>.

"Through NFAAS, affected Sailors, Navy civilians or Navy families should provide current contact information," Mike Bruner, the Navy Family Emergency Response

"We've had earthquakes rattling all ends of the planet, tsunami warnings, volcanic clouds over Europe, flooding, and June 1 is the start of the hurricane season. The ideal time to log on is now."

Bruner said that people should log on, have a look at the site and see where they'll check in their family, and get familiar with how they would conduct a needs assessment.

"This won't be so easy to do when people are stressed from having to evacuate their home," Bruner said. "It's also a good idea to see if contact information needs updating, since many families are moving this time of year."

Figure 6-4, Banner Head.

Tripod Head – A tripod head (See Figure 6-5) is a single, short line of larger type set to the left of two lines of smaller type. The tripod portion (larger wording) should be twice the size of the definition or main headline. For example, a 36-point tripod would dictate the main head be set in 18-

point type to give the true tripod appearance. A colon is required when the tripod conveys a separate thought.

Figure 6-5, Tripod Head.

Wicket Head – A wicket headline is a tripod in reverse (short line of larger type set to the right of two lines of smaller type). The colon is not used in the wicket. Although seldom used, a wicket should be considered when trying to vary your newspaper design.

Kicker – The kicker (See Figure 6-6) introduces a feature article with a pun line above the main head. The information for the kicker is extracted from the bridge or the body of the story. When using a kicker, do not repeat words in the main headline. The kicker is underlined and about half the size of the main headline.

Homes receive personal touch

Fix it store helps improve quarters

Figure 6-6, Kicker.

Hammer Head – Often called a reverse kicker (See Figure 6-7), the hammer head is twice the size of the main head, set flush left, and is no wider than half the width of the headline area.

Figure 6-7, Hammer Head.

Novelty Head – A novelty head (See Figure 6-8) features typographical tricks, such as setting part of the head upside down, using an ornate typeface or substituting artwork as characters. Use the novelty headline sparingly with appropriate feature articles. Overuse of this headline may lead to your readership questioning the credibility of the newspaper.

CAPTION WRITING

In addition to headlines and leads, photo captions are among the most read items in any publication; therefore, we must take the time to discuss the anatomy and the importance of these elements. Captions are sometimes referred to as cutlines.

(NOTE: Photography will be discussed in the visual information section of the manual.)

As the old saying goes, "a picture paints a thousand words." However, most would argue that photographs are most effective when accompanied by explanatory text. Writing good captions to accompany a great photo makes all the difference in the world. A good caption supplements the photograph by explaining action, naming people and giving background information.

Caption writing is a specialized form of news writing. It answers the same basic questions as the news story. And like news stories, captions must not violate the principles of security, accuracy, propriety and policy or (SAPP), and they adhere to the Navy and AP style as well as the ABCs of journalism – accuracy, brevity and clarity.

Gathering Caption Information

Gathering information for photo captions is similar to gathering information for news. When you gather material for captions, look for the who, what, when, where, why and how of the event or situation you are shooting. The "who" information must be thorough. In other words, get the name, rank, service, job title, hometown, etc., when identifying the who of your photograph. To ensure accuracy, you should record the caption information immediately after each shot or series of shots. Do not let subjects get away without jotting down the required caption information. They may be hard or impossible to track down later, and you may forget the specifics of the photograph. ALWAYS CARRY A NOTEBOOK AND PEN OR PENCIL.

A few points to consider ...

- What element or elements of mass appeal are in the photograph (SPICE COPPS)
- Will the photograph be released internally, externally or both? Photographs for external publications may require more information and full explanations
- Will the photograph be used alone or with a story?

With these basic considerations in mind, try to stick with the five W's and the H. Find the answers to these pertinent questions, and you will have more than enough information to write your caption.

- **WHO:** Identify people in the photograph by rank, full name, title, hometown and so forth. Also note relative positions of people in the photograph when there is more than one and, if it is not obvious, who is who by action, age, gender or rank. Sometimes it is helpful to note clothing or physical characteristics of the people being photographed, such as a color of clothing, wearing of glasses, or a specific hair type or hair color. There should be no doubt in your notes as to who is whom
- **WHAT:** The "what" is the action taking place in the photograph, such as slicing a cake, performing 3M spot checks, or re-enlisting. However, the "what" can also be the subject of the photo's action. Examples are equipment, ships, aircraft or submarines, to name a few. In these instances, as with a "who," full identification is a must
- **WHERE:** The "where" includes the location of the action and should include ship's name, port of call, operating area, street names, building names or numbers, etc
- **WHEN:** "When" records the time of day and date the photo was taken. This is especially important for stand-alone photographs that will not accompany a news story or feature
- **WHY:** Unless it is obvious, record why an action is taking place. Is it part of a command basketball championship or a monthly awards ceremony? As with the "when" category, this is important for photographs that will stand by themselves
- **HOW:** If there are circumstances that led to the photograph being taken and these circumstances require explanation, make sure you make note of this.

Caption Components

Everything you have to say about the photograph should be in the caption, including the essential facts. These facts must be tied into the scene of the photograph. The length of a caption is always governed by what must be told about the photograph. Captions consist of four major components:

- The action
- The identification (persons or things in the photograph)
- The background information
- The credit line.

The Action – The first sentence of a caption is the most important. It must link with the photograph by describing its action. Often, a caption's first sentence reads like a news story's lead sentence. It describes what is going on in the photograph without repeating the obvious. The first

sentence is written in present tense and active voice, because the photo captures an exact moment in time and holds it in the present.

The Identification – The second part of a caption is the identification of who is in the photograph. The subject of the photo links to and is identified according to the action. In most cases, tell the reader the person's complete name, rank, unit, job title and hometown. When writing captions for sports imagery, military titles ranks, etc. are not needed. Instead use the player's team position, nickname or jersey number.

One exception to fully identifying your subjects occurs when you have more than three people in a photo. At that point, if the people have a commonality, such as a sports team or a division, identify them as that group. For example, if you shoot a photo of your command's culinary specialists serving lunch and there are more than three in the photo, you can write, "USS Carl Vinson (CVN 70) culinary specialists ..."

For group shots, such as sports team or command divisions, where you are publicizing the photo strictly as a roster photo, a complete listing of their names is okay. In this instance, identify the persons from left to right, front to back. If not, use a generic term, such as "Sailors," in the caption. Otherwise, the caption becomes a laundry list and will bore your reader. However, if someone of prominence is in the photo, such as the president, you should pick him out of the crowd and identify him. The rest of the group would be identified by a generic name.

The Background Information – Background is often ignored by new MCs, but it is critical to sell your work to an editor. The background tells your readers why the photo is important. A photo of a Sailor standing guard while a helicopter lands is interesting, but the background information will explain to the reader why the photo is significant.

Background information comes from the same place you get background information for all other public affairs products – Rhumb Lines, public affairs guidance, maritime strategy, Navy.mil, etc. The amount of background information required in a caption sometimes depends on where the photo will be published. For example, if you plan to publish the photo in a print product, you may be limited to the amount of space available in the publication. But, it is important to give more information than you will think you need. The editor can cut, but he can't add information if he doesn't have it.

The Credit Line – The last component of the caption is the credit line, or the identification of the photographer. There are several ways of crediting photographs. Some newspapers and magazines give photographers personal credit lines, while others use a blanket statement such as "all photos are U.S. Navy photos unless otherwise credited." However, the recommended way is to put the credit line at the end of the caption itself. Current credit line format is: "U.S. Navy photo by RANK and NAME." For example: U.S. Navy photo by Mass Communication Specialist Myra Mains. Accompanying your credit line should be the word(s) "released" or "Not for Release." Your command's designated photo release authority (LCPO, division officer, Department head) makes this determination after reviewing the photo for SAPP.

Another important element for crediting the photographer comes in the form of a VIRIN, or Visual Information Record Identification Number. The VIRIN, which comes before the photo's dateline, catalogs the visual information, assists in the rapid retrieval of that information, and identifies the photographer or videographer. More information on caption writing and creating VIRINs can be found on the [Navy Visual News Service website](#).

Note: VIRIN format has changed as of February 1, 2011. Module 2, Chapter 7 discusses the new format.

Caption Writing Guidelines

Using a caption provided by the photographer, receiving agencies (such as the various services' websites) may rewrite a caption to suit their own purposes by taking information contained in the caption and preparing a cutline. Your name is on the work, so be sure to check the accuracy of anything that is posted or published.

To create accurate and concise captions, stick to the following guidelines:

- Begin the caption with a dateline in case the editor decides to run the photograph by itself as a stand-alone image. More information on datelines can be found in Module 1/Chapter 5
- Avoid the use of military jargon and use the Associated Press Stylebook
- Never write a caption for a cropped photo unless that photo is directly in front of you at the time. (Cropping means to cut or trim unneeded portions.) Don't guess or write from memory. You may mistakenly provide information no longer seen in the image
- Captions should be simple and direct, often conversational. Make them short, but use complete sentences with a subject, verb and object. Keep them around 50 words
- Don't always begin captions with the person's name. Try to recreate conversations, colors, smells or sounds associated with the picture and the situation described
- Don't editorialize
- Avoid clichés
- Don't state the obvious.

Examples:

100714-N-VCODE-208 ATLANTIC OCEAN (July 14, 2010) Former President George H.W. Bush watches flight operations from the landing signal officer's platform aboard the aircraft carrier that bears his name, USS George H.W. Bush (CVN 77). Bush and his wife, Barbara, spent their time aboard watching flight operations, touring the ship and visiting the crew. George H.W. Bush is conducting training in the Atlantic Ocean. (U.S. Navy photo by Mass Communication Specialist 3rd Class Nicholas Hall/Released)

100727-N-VCODE-008 SEA OF JAPAN (July 27, 2010) The Republic of Korea Navy amphibious landing ship ROKS Dokdo (LPH 6111) and the aircraft carrier USS George Washington (CVN 73) transit the Sea of Japan. The Republic of Korea and the United States are conducting the combined alliance maritime and air readiness exercise "Invincible Spirit" in the seas east of the Korean peninsula from July 25-28, 2010. This is the first in a series of joint military exercises that will occur over the coming months. (U.S. Navy photo by Mass Communication Specialist 3rd Class Charles Oki/Released)

100725-N-VCODE-072 U.S. 5TH FLEET AREA OF RESPONSIBILITY (July 25, 2010) Logistics Specialist Seaman Brandon Moore, from Richmond, Va., picks up aviation parts for Strike Fighter Squadron (VFA) 37 in the maintenance support package space aboard the aircraft carrier USS Harry S. Truman (CVN 75). VFA-37 is deployed as part of the Harry S. Truman Carrier Strike Group supporting maritime security operations and theater security cooperation efforts in the U.S. 5th Fleet area of responsibility. (U.S. Navy photo by Mass Communication Specialist 3rd Class Jared Hall/Released)

Remember, photographs, despite their unique storytelling ability, are seldom effective enough to stand alone. No matter how exciting the picture may be, it fails unless the viewer understands what is going on in the photograph. The area to provide information the photograph cannot give is in the caption, or the text that accompanies the photograph. It is your responsibility as the photographer to gather the necessary information and write complete, concise and factual captions.

SUMMARY

In this chapter we discussed the importance of recognizing the functions, components and attributes used when creating headlines and photo captions. Headlines and captions accompany other products to fully tell the Navy's story. From here, we switch gears from structured writing to writing features, which allows the MC a bit more creative freedom.

CHAPTER 7

FEATURE WRITING

Learning Objectives: Upon completing this chapter, you should be able to do the following:

— Identify the basic elements of a feature story.

INTRODUCTION

As we learned in chapter 5, newswriting is an important tool in telling the Navy story to our external and internal audiences. However, newswriting is structured to report the facts in a timely manner with little room for creativity. For this reason, we can turn to feature writing and draw the human aspect of the news we are reporting. In no way does this diminish the need for newswriting; just the opposite, it enhances it.

In this chapter we will discuss the purpose for writing features, types of features, the anatomy of a feature story and tools to help you write features. *(Much of the information here is courtesy of the Defense Information School public affairs leadership and public affairs departments.)*

Feature stories boost morale and often tell the human side of the story beyond the hard facts. Research has shown that people like reading about themselves and others. In all honesty, there's probably not enough varying hard news happening within your command. You can only write so many stories about inspections, certifications, visits and port visits before the stories become redundant. Plus, most military publications are weeklies. By the time your story is printed, it's usually old news. Features can help mitigate that loss of timeliness.

A feature story can be written about anything. It can make us laugh; it can make us cry; it can teach you how to do something. What you have to decide, as a feature writer, is what kind of story works for your type of publication and for the topic at hand.

TYPES OF FEATURES

NEWS FEATURE

A news feature is similar to straight news stories in that it has a news peg, includes important W's and H, and requires primary and secondary sources. On the other hand, a news feature is different from straight news because it uses feature-writing styles and techniques. News features are especially popular in afternoon dailies or military weeklies. In both, the basic facts of the story have already been reported, so editors, through features, try to present the facts in a more interesting or more of a human-interest format. News features put the reader at the scene of a news event through narration and a more vivid description of what took place.

Human Interest Feature

A human interest feature requires primary and secondary source interviews and may include the use of research and observation as information-gathering techniques. Human interest is the broadest feature category. These features are written to inform, educate or entertain the reader. The news peg is replaced with reader interest.

Personality Feature

People are curious about other people. It's human nature. The properly written personality feature is a vivid word picture of the subject's personality traits and physical features as well as a description of the things that make the person unusual or interesting. The effective personality feature leaves readers feeling they have met the subject face to face and know that individual's personally.

A personality feature is similar to other features in that it appeals to people's interest in other people. It normally points out special achievement, success or obstacles surmounted in life and centers on a particular event or achievement. A personality feature should be one of the most enjoyable features you write. After all, you can use your job to satisfy not only your readers' curiosity about your subject, but your own.

Auxiliary Feature

The auxiliary feature is a catch-all feature short in length that makes use of numerous photographs, graphic artwork, or a combination of both. Because this type of feature is short, the writing must be written tightly. For the same reason, accompanying captions are also critical. There are, however, some features in this category that could fill an entire page, be used as a two-page feature (double truck), or even be run as a continuing series. This feature type can range from a travel story to a light-hearted approach to a common subject. Most often, auxiliary features appear in military papers published overseas because of the unique needs of readers in those areas. But there's no reason why these features couldn't appear in stateside publications. The type of auxiliary feature used is limited only by innovation and imagination.

Travel feature

Travel features are used primarily overseas, where language barriers may make it difficult for readers to learn about travel opportunities. The best way to begin work on a travel feature is to experience a trip yourself and take thorough notes. DoD Directive 5120.4, "Department of Defense Newspapers, Magazines and Civilian Enterprise Publications," states that military publications must not imply commercial endorsement. When writing travel features, be careful that you do not imply a travel location is the "best" location or that your command favors it. You can avoid implied endorsement by mentioning other similar travel opportunities. This can be done by listing other locations within your article or in an information graphic next to your article.

Local point of interest, historical feature

Similar to the travel feature, this type of feature is especially appreciated in overseas publications. It is often a vital part of the installation's community relations program. It also helps to get base personnel out of barracks rooms and family housing to partake in the host country's culture and daily life. These features must present the subject matter in good taste. The historical parts must be accurate or you could create bad relations between your installation and the host country.

Unit feature

Unit features provide in-depth coverage about one particular organization on an installation, such as the motor pool, a branch of supply, or the people who operate the fuel farm. While the mission and equipment are important, it's all too common for writers to concentrate on these and ignore the most vital aspect of the operation – the people. They are the story. Junior service members and civilians often are overlooked. Don't allow this to happen. Unit features take a lot of time to write, and they require in-depth research. These features, along with accompanying photos, often fill one or

two pages. They are sometimes used to boost unit morale or as a way to highlight a particular award or accomplishment.

How-to features

How-to features give your readers something they need and want. They can span the full gambit of subject matter, such as how to make a simple table for a barracks room, how to read your German telephone bill, or how to order a meal at a Japanese restaurant. Don't hesitate to seek expert help if you need it. If your how-to feature explains construction steps or contains a recipe, do it yourself to make sure the instructions are correct.

Brights

Brights are short, usually humorous features we use to break up and lighten a page of serious or somber news. They serve to entertain the readers and make the paper more attractive to them. A bright is a complete story that is short enough to be used as filler.

Seasonal/special-interest feature

This type of feature may focus on days, weeks, months or seasons. Winter fun, Black History Month, Mother's Day, and many more fit into this category. At overseas locations, it's a great way to explain the host country's holidays and celebrations. This also helps support your unit's community relations program. Let good artwork do a share of the explaining.

Picture Stories

In defining the auxiliary feature, we spoke about how photos and artwork can play a big role in helping to tell your story. A page in a publication filled with a hodgepodge of photos may not make a story, but a page of photos with continuity, purpose and a short auxiliary feature does.

Selecting and displaying just the right photographs is similar to writing your story. When the material is selected and arranged in a coherent and entertaining manner, it has impact. If poorly done, the information is submerged in the resulting clutter. A collection of pictures can be arranged as an essay or a story. Both feature a collection of photos; however, with a photo story, there is a beginning, middle and end. The photo essay tells no story; it simply highlights an event. It should also be noted that a picture story may or may not be accompanied by text other than photo captions. If the feature contains accompanying text, the photo captions bridge the gap between the photos and the accompanying text. The number of photos used in the photo story depends on the importance and complexity of the subject. The key is not how many but which ones.

Feature writing

The challenge of feature writing is to make the article irresistible to read. You must pull the reader in with words. In feature writing there are fewer constraints, but you still must make the story clear and concise, and most importantly, **factually correct**.

STORY STRUCTURE

The basic parts of a news feature (See Figure 7-1) include the lead, bridge or nutgraph, body and conclusion. If each paragraph flows into the next logically and all the readers' questions are answered, then the story is successfully organized. Feature writing adheres to the same ABCs of

journalism presented in newswriting. You must ensure that all of the information is accurate, brief and clear.

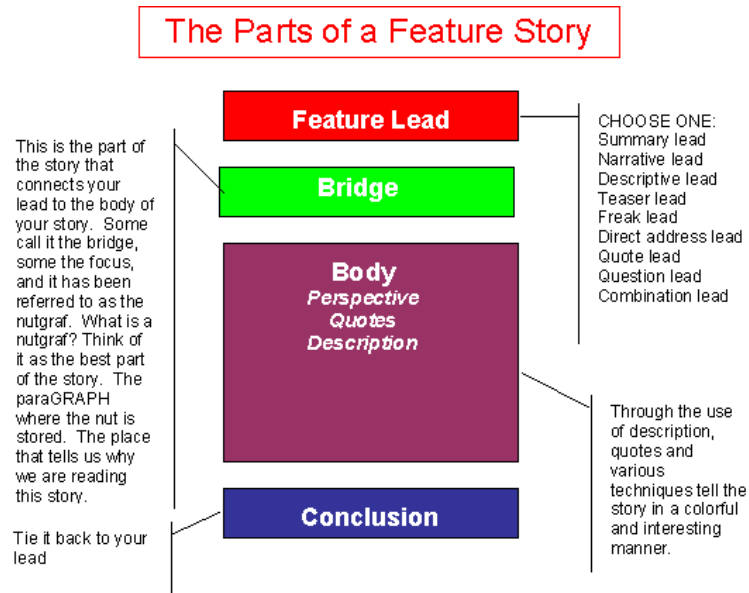

Figure 7-1, Parts of a Feature Story.

The Feature Lead

The feature lead is just like an attention step in a speech. Its purpose is to draw you into the feature, making you want to read more. In this chapter, we will cover nine feature leads:

- Summary

Strong winds, combined lethally with a fire in a Queens high-rise building Thursday, created a "blowtorch" that roared through an apartment building and into a hallway, killing three people and injuring 22.

This lead summarizes the events with the who, what, when and where, while using strong imagery to do it.

- Narrative

Louis Chacon telephones the sheriff's office here recently and complained that there was a "big" snake in a toilet at the house he had just moved into.

Deputies investigated and found nothing in the bowl.

Chacon explained to them that the snake was very sneaky and only stuck its head out of a hole in the bottom of the commode when it thought no one was looking – that is, when a person had his back to the bowl.

This narrative lead not only tells a story, but the narrative plays out in your head like a video camera. It is chronological, suspenseful, and will certainly make the reader want to finish the story. It plays on a common irrational fear.

- Descriptive

*Instantly, the fuel mix exploded into a **tower of red, twisting flames churning wildly upward**. Soon the blaze **engulfed the building**; its **thick, black smoke darkening the morning sky**.*

A descriptive lead is colorful and uses all of your senses to describe the event. The words in bold should bring out the images in your brain.

- Teaser

*It is mid-afternoon on a Sunday in August, and **the fog hugging the Golden Gate Bridge** and rocky coastline finally has lifted. Tourists escaping the cable-car routine, locals **fleeing cramped apartments**, surfers who **live on the edges** of the city – they're all drawn here for one thing: Ocean Beach.*

*With the **long expanse** of fine sand and the **lull of crashing waves**, it looks like a California postcard.*

And that is what makes this such a perfect place to die.

At this point if you're not feeling an overwhelming curiosity on why a beach is such a beautiful place to die, then you must be dead already! Where is this story going? Is this a story on suicides? Is this a story on a beachfront cemetery?

The line, "And that is what makes this such a perfect place to die," is the perfect line to make the reader turn the page.

- Freak

John Scheer has been designing women's clothes for more than half his life. He is now 10.

In your brain you should be going, "Ten? You mean, he started at 5 years of age? How is that possible?"

- Direct Address

You would not think that a Hollywood-perfect small town would go gaga over garbage cans, sparking a trend in trash that some predict will sweep the nation.

You also would not think a 66-year-old photographer and artist who wears rainbow-colored suspenders would be San Francisco's latest trendsetter.

But then, you've never met Dick Horn – lover of rainbows, loather of over organization and painter of garbage cans.

The writer is addressing "YOU," yes, you. The start of every direct address lead is the subjective personal pronoun.

- Quote

Imagine your story starting out this way.

"Sometimes history is written in hot, little dusty places on the Earth," Maj. Gen. James N. Mattis, commander of the 1st Marine Division, told his troops when the mission to escort him into the city was done. "That's what we did today, and it's good history."

Quotes should only be used sparingly as leads and must be strong enough to carry your reader into the story.

- Question

Where are the scariest, most scream-inducing, gut-wrenching roller coasters in the world?

If you are a lover of roller coasters, you just might like the above lead. The lead makes you ask yourself the question, "You know, I never thought about it before, but where are the scariest, most scream-inducing, gut-wrenching roller coasters? I really would like to know!"

As with the quotation beginning a lead, a question must also be effective enough to truly grab the readers' attention and arouse curiosity. Some readers may not care what the answer is and move on to the next story.

- Combination

Take blood from the dead and give to the living?

In Russia they do.

Sgt. Cynthia P. Clinger, a medical sergeant from Fort Knox, Ky., says there is not a need for blood drives like there is here. They take living blood cells from cadavers, and as long as that person was healthy, they can use the blood for transfusions.

Is this a combination question/narrative lead? It's each of them and it works.

Bridge/Nutgraf

Once you have a great lead and you have grabbed your reader's attention, it's now time to tell your reader just what the feature is going to be about. You do this through the bridge, which, in feature writing, is also called the nutgraf. This part of the feature tells the reader why he should read the feature in the first place. If you want to keep your reader long enough to read the body, then make sure you place the bridge high in the story. Beyond the fourth or fifth paragraph, your reader could get frustrated and bored and ask himself why he is still reading. The nutgraf is the "what's-in-it-for-me" hook to keep the reader interested.

- Descriptive Lead and Nutgraf

Victoria Marriot wakes up every morning at 5:30 with her gunnery sergeant husband, and for the next 12 hours, she will be at home and at work.

Although her first child will not arrive until 6:45 a.m., the early morning allows her time to do paperwork, clean the house and cook breakfast.

This has been her lifestyle for the last three years as a licensed child care provider, one of the most demanding jobs as more and more dual-income military families try to find affordable alternatives to institutional care.

- Summary Lead and Bridge

The winner was weeping, the loser was seething, and the last-place finisher was accused of influencing the outcome.

The fans? Well, they just went back to their reading.

Such was the scene Wednesday morning at the Indiana University Track Stadium following the women's race-walking event in the Pan American Games.

Body

The body of a feature further reflects the focus of the story using creative writing techniques and attribution. The body should follow on a chosen organizational pattern. Ultimately, however, if each paragraph flows into the next logically and all the readers' questions are answered, then the story is successfully organized.

- **Chronologically.** Organized by time or sequence. Any story that would be interesting told from beginning to end, start to finish, such as a story about a finger-painting contest for 4 year olds at the child care center. This feature could take advantage of suspense by doing a play-by-play of the contest before finally revealing the winner
- **Topically.** Break a subject up into topics and discuss each. Example: A story about an upcoming exercise might be divided into sections on purpose, schedule and troop reaction. Most speeches and papers are organized this way; you have probably produced outlines for them. Topical organization is the most common organization pattern and is also used in inverted pyramid
- **Spatially.** Explained in a logical sequence, having to do with physical arrangement. Example: Left to right, near to far, top to bottom, front to back. You could use spatial organization to organize a story about a base deployment exercise, moving from the gate to the various locations in camp
- **General to Specific (or vice versa).** Especially when introducing the reader to something new or technical, present general (or background) information the reader can understand before becoming to specific. Example: This is a good way to introduce a new weapon system, base telephone exchange; it's also helpful in "how-to" stories of all kinds
- **Functionally.** Tell what something does and relate it to the larger function. Break a whole down into its individual parts. Example: A story about a new computer system in your command could be organized by each of the ways in which it will be used
- **Descending Order of Importance.** Used most often with feature stories containing strong news pegs and interesting detail. Example: A story announcing and explaining an upcoming exercise (or giving its results afterward) or a wrap-up of a six-month deployment. This pattern is most often used in a story that has significant news content.

FEATURE CONCLUSIONS

Straight news stories have no conclusive endings. The writer simply stops writing after the last detail is provided. Cut the last graph — or even the last few graphs — and the reader still gets the complete story. A feature, however, is the skilled telling of a complete story and, like any other story, needs a strong feature conclusion where the writer makes or reinforces a point. The type of ending used depends entirely on the nature and angle of the story itself. The writer must choose the style most appropriate to the story that both satisfies the reader and clearly signals the end of the story. Remember, however, that the conclusion should complement the lead, not compete with it.

Types of Conclusions

Summary

- Summarizes the points of the story
- Keys in on impact, effects or outcome
- Last chance for the writer to make his or her point
- Usually found in news features.

Tie-back

- Completes a fact, idea or scene planted in the lead
- Returns the reader back to the point he or she was put in at the lead
- The conclusion needs the same settings, actors or ideas introduced in the lead
- Key to tie-back is to make it recognizable by bringing the reader full circle.

Wrap-up

- Ties up loose ends, solves problems, or answers questions from the lead and makes a strong point
- Powerful quotes can be used for wrap-up endings
- Quotes should be thought-provoking and provide significant insight.

Climax

- Brings the adventure, day, method, etc., to a close and ends the story at the same time
- Naturally lends itself to chronological stories.

Unending

- Turns the reader's attention to the future, saying that "life goes on."
- Challenges reader to look at his or her own future or the future of the characters in the story in a new light, based on the story focus.

Stinger

- Surprise conclusion designed to jolt the reader
- Must be worked up to gradually
- Reader should almost feel he or she knows the inevitable ending
- Stingers are not common endings. Contrived stingers are very obvious.

Combination – Combination of two or more of any type of conclusion.

EXAMPLES of CONCLUSIONS

Sample lead

The 6-foot, 3-inch man wears a black belt as a result of seven years of Marine Corps Martial Arts Program training. His home is protected by an electronic surveillance system, a no-nonsense, 52-pound, muscular pit bull mix named Chesty and the vigilance of his Meade Heights neighbors, most of them military families. His children know they should never provide personal information to callers or strangers on the street. He always keeps his 2010 Hummer in perfect running order.

Each member of his family carries a cell phone at all times to call for help in emergencies. He owns two registered weapons – a shotgun, which is in as pristine condition as when his great-grandfather bought it a century ago, and a custom-made pistol.

The sleek, Austrian-made handgun is placed securely by his bedside, the shotgun within short reach in a vault in the master bedroom's small office. Today, Eddie Lancaster is in the intensive care ward of Johns Hopkins, the victim of multiple stab wounds after being attacked while he walked from his car to his dry cleaners in Odenton. The knife-wielding attacker surprised Lancaster from behind, stabbing him repeatedly in the neck and back and disabling him before he could defend himself.

Summary conclusion

The attack on Eddie Lancaster is not an isolated incident, even for service members. County police statistics show that Anne Arundel County residents, like all Americans, spent about \$350 more per family for personal and home security last year than in 2009. At the same time, the reports said, violent crime rose nearly 6 percent in most central Maryland counties. No one is immune to this danger.

Tie-back conclusion

A number of service members like Eddie Lancaster, who are dedicated to preserving freedom, have been the victims of random violence in a country they've sworn to protect. Many people are frightened – for themselves and their families – and they barricade themselves in their homes instead of confronting the problem. Rather than give in, Lancaster's family said they believe society must work as a whole to make America safe again.

Wrap-up conclusion

"Poor Eddie," says Andrea Lancaster, as she holds the hand of her comatose husband. She battles to stem the tide of tears, her lips quivering in a sad dance of despair. "He really believed that he had every possibility covered and that we were completely safe."

Climax conclusion

The world outside Johns Hopkins continues its daily schedule, and the monitors in Eddie Lancaster's room continue their steady hum. His chances for survival have improved since he was first brought in Wednesday, but the doctors still cannot make any promises to his wife and family.

Unending conclusion

Andrea Lancaster and her children keep a silent vigil at the hospital, hoping their love is strong enough to keep their husband and daddy alive. Whether he lives or dies, they know that none of them will ever feel completely safe again.

Stinger conclusion

The fact that most victims of violence have met their attackers, even if only in passing, makes the issue even more frightening. The victim in this story had also met his attacker, many times. Eddie Lancaster was stabbed by the panhandler whom he gave a dollar to every day outside the convenience store where he bought his morning coffee.

USEFUL TOOLS

As written above, feature stories blend the elements of news with creative writing tools. In this section, we will discuss these tools.

Syntax

Syntax describes the way we put together words to form phrases, clauses and sentences. Proper syntax means sentences do not sound awkward or confusing — they are easy to read and flow together smoothly. It means choosing the right words, the appropriate words, for the piece we are writing.

Transitions

One way to improve the copy in the body of your feature is to use transitions. Transition literally means movement from one place to another. In a feature story, transitions carry the reader into a new sentence or paragraph.

Here are some examples useful transitional words arranged according to functions:

Time	Contrast	Cause/Effect	General to Specific
Then Now Next First Second	However Nevertheless Yet Even through despite	Therefore Thus Hence Consequence so	In fact Especially For instance For example
Reference	Summary	Attitude	Addition
The former The latter The following	In summary To sum up In conclusion	Fortunately Unfortunately naturally	Also Too Furthermore Moreover

Personification

Personification means giving human characteristics to non-living objects, ideas or things. Take one of the most familiar symbols in our country – Uncle Sam. Uncle Sam is a personification, representing our country by a tall lanky fellow, not unlike Lincoln. In the past "Uncle Sam" has been depicted in cartoons as compassionate, but not unwilling to roll up his sleeves and get into a fight.

Other examples:

- The moon winked at me from the clouds above
- The flowers danced in the breeze
- The wind howled
- Time marched on slowly.

Similes

A simile is a stated comparison between two or more objects using "like" or "as." Most often, the simile is used to make writing more interesting or more entertaining. Some examples:

- His face was as ugly as old running shoes
- John Smith had a mind like a computer
- That idea went over like a lead balloon
- Your explanation was as clear as mud.

Metaphor

A metaphor is the comparison of one thing to another without the use of "like" or "as". You should use metaphors ONLY for the sake of beauty, necessity, polish or emphasis. It should bring something to your story and help to provide a way for the reader to visualize or see the story play out in more colorful terms.

- Time is a thief
- Time is money
- Life is a journey
- The teenage boy's stomach was a bottomless pit.

Hyperboles

Hyperboles emphasize something by deliberately exaggerating or understating it.

- Jerry can run rings around a cheetah
- Mark Twain wrote a couple of stories about life in the South
- He is older than dirt.

Anecdotes

Anecdotes are short, entertaining stories within a story that give insight to the subject. They give an example or capture the essence of a point. Usually, they are personal or biographical accounts of certain happenings.

Let's say you're doing a story on the small portions that are given by upscale restaurants. Your story might include the following anecdote:

"While attending a private dinner party one evening, Alfred Hitchcock, whose famously portly profile portrayed a certain fondness for food, was dismayed to find that the portions being served were far from adequate.

"At the end of the evening, the host bid Hitchcock farewell. 'I do hope you will dine with us again soon,' she added.

"By all means," Hitchcock dryly replied. 'Let's start now.'"

The key is to make the anecdote relevant and interesting enough that it enhances the point of your story. Encourage your interview subject to provide anecdotes, especially those that involve them personally.

Varied sentence structure

One of the most basic rules in the English language is to use simple sentence construction – **subject-verb-object**, or "who did what" – whenever possible. However, using a preposition or clause to start a sentence often adds variety to your feature. In feature writing, if you strictly follow the subject-verb-object construction, your writing will become boring.

SUMMARY

In this chapter, we discussed features and how you can use features to tell the Navy story. We also compared newswriting with feature writing and broke down the anatomy of features. But, this information only skims the surface. Writing features is an art, one that must be practiced and refined. You should seek out books, magazines, online blogs, etc., and stay up-to-date on what is being printed in the world of newswriting and features.

CHAPTER 8

INFORMATION AND NEWSGATHERING

Learning Objectives: *Upon completing this chapter, you should be able to do the following:*

- *Conduct research in preparation for interviews.*
 - *Coordinate interviews.*
 - *Conduct interviews.*
-

INTRODUCTION

As you have read throughout this module, your role in reporting the news and telling the Navy story is an important one. Simply stated, you serve your country, the Navy and your commander, and your objective is to act as a conduit of command information between your commander and your command's audiences.

In previous chapters, we have discussed the fundamentals of public affairs, the nature of news, news and feature writing, and headlines and captions. In this chapter, we'll discuss the organization of typical newspaper and broadcast staffs and methods of gathering information to use in your various products.

The first step to gathering information is to know your community and audiences well. One journalist philosopher said, "The role of the press is to keep a community in conversation with itself." If a community is to function, the media must keep community members talking with one another. They must understand what interests their community, and then report on what is important. As an MC, you are the internal media for the Navy.

The key to being an effective reporter serving your community is knowing what to look for, where to look for it, and how to use your time effectively. You should become familiar with your command's organizational structure, key offices and helpful points of contact. Much of this information you will learn through networking and through your fellow MCs.

ORGANIZING COVERAGE

Beat System

Most command newspapers and broadcast detachments use a beat system through which reporters make regular visits to a specific source or area to gather news.

One type is the "geographical beat," whereby the reporter is assigned to cover a specific area of the installation or, perhaps, a particular department or division.

The "functional beat" system is one in which a reporter is responsible for covering any event pertaining to his "functional" area. Under this system, if you write about sports, you go to all the games and related activities.

Categories of reporters

Civilian newspapers and networks use beat systems, but they also categorize reporters. General assignment reporters cover a variety of assignments regardless of subject. Special assignment reporters cover stories for which they are especially adept, such as legal, consumer, science health, etc. If your paper or broadcast detachment uses a geographical beat system, you are a general assignment reporter. If it uses the functional beat system, you are a special assignment reporter.

Stringers

Most military public affairs offices have a limited number of personnel who can't be everywhere at once, thus hindering the mission of telling the Navy story. To help fulfill the mission, you can employ stringers – fellow Sailors, civilians or family members – as part-time reporters who write or provide story information about events in their organizations or communities. Stringers should be trained to determine news value, prepare copy for submission, and identify the importance of deadlines. Stringers are compensated for their services through bylines and recognition from the command.

TYPES OF NEWS SOURCES

For an energetic and resourceful writer, avenues for finding news stories are limitless. In reality, however, you will find that your job in the Navy does not give you the luxury of spending days, or even hours, tracking down elusive leads that may eventually result in one story.

Your job as an MC is to tell the Navy story. That means you must write positive copy about your command and its people (exception: adverse news situations). This is especially true regarding ship or station newspapers for which you may be writing. Their purpose is to inform, educate and entertain their readers and to provide a means of recognizing the achievements of the personnel in the organizations they represent.

Written Communications

Typically you will find the primary sources of Navy news come from messages, directives, e-mail and official correspondence. This can include news of coming events; current fleet exercises and operations; search, rescue and salvage operations and countless other occurrences.

Messages – When a message arrives aboard ship or at a shore activity, they are made and distributed to various departments. The PAO normally gets copies of all message traffic that might be of interest in carrying out PAO duties.

Information contained in a message is seldom detailed enough to be used for writing a comprehensive story. However, the basic facts are included and they provide a good starting point for you to develop a story.

Directives – Directives provide another source of Navy news for release to the civilian news media. You will find that much of the information they contain is intended for use by Navy personnel. Information about pay and allowances, uniform changes, advancements and promotions, service members' and dependents' benefits, training and educational programs, new regulations, morale, leadership, charity drives and similar subjects are put out in directive form. When analyzed and written in news form to play up local interest or some other news peg, information of this type makes

good copy for command newspapers and other publications written primarily for a Navy-oriented audience.

Official Correspondence – Official correspondence between commands, whether written on official letterhead or sent by e-mail, often provides tips for worthwhile stories. Also, products from the Navy Chief of Information, such as Rhumb Lines, provide Navywide themes and messages, which can be turned into stories of interest to local Sailors. Keep in mind, security is an important factor for you to consider before using any information. If the material is classified, you must not use it.

NOTE: *Remember, when you receive news or items of news value in written form as above, you must localize and rewrite the information to meet the needs and interest of your audiences.*

NEWSGATHERING

The most common methods of gathering news are interviews, observation and research. With each project, you may employ all three and more than once.

INTERVIEWING

Interviews are the foundation of news reporting, and the act of interviewing is an acquired skill that must be practiced, practiced and practiced. About 90 percent of everything in a news story is based on some form of interviewing either in person, by telephone or occasionally, by correspondence. Whenever possible, you should always conduct interviews in person.

Interviews can be either planned or unplanned. Planned interviews are always recommended; however, you may find yourself in the middle of a news event and you need to conduct an impromptu, unplanned interview. With planned interviews, you have time to conduct research prior to sitting down with your subject-matter expert. In an unplanned interview, you must think on your feet. Using the five W's and H should get you started with the basic questions.

As an MC in search of information, you must learn who to get information from and how to record facts. You must learn techniques for handling different kinds of people, how to draw some out, how to keep others on the topic, and how to evaluate the motives or honesty of others. In short, you must learn how to get along with people and how to treat them with tact and understanding while still accomplishing your purpose.

Basic Interviewing Techniques

The success of an interview depends on the writer's preparation, professionalism and "people skills." You have to be able to ask the right questions in the right way at the right time. Much of it is something that cannot be taught - only learned through experience. But if you can remember the fundamentals of interviewing, you will continue to develop. Interviewing enables writers to not only get information, but to add color and dimension to stories while also establishing a network of contacts.

An interview is a form of two-way communication. Its purpose is to investigate, explore and reconfirm facts surrounding a news story, event or topic. It also offers expert opinions on the facts that are the framework of the story and adds dimension that would be hard to produce strictly from facts.

We find the experts and ask the questions interested readers would ask in order to write a thorough, informative story. Although an MC should know a little about the interview topic, it's not necessary to be a subject-matter expert to conduct a good interview and write a good story.

You must keep in mind that you not only represent yourself, but also your publication, your command and the Navy. It's vital that you act professional and maintain your military bearing while interviewing any person - regardless of rank or position. As discussed in Chapter 1 of this module, being an MC means being squared away – proper haircut, shined shoes, and neatly pressed uniform with fresh ribbons and other insignia. It also means to be well spoken.

Before the Interview

When possible, take time to prepare for the interview. The first step in the interviewing process is defining the purpose for the interview. Identify the information you want and who can provide it. This will form the foundation for your interview preparation. Identifying your subject-matter expert (SME, pronounced "smee") is key. Don't be afraid to interview persons other than the leadership. Sailors on the deckplates are closer to the information on a daily basis, just be wise and think professional when choosing your SME. Also, prepare to interview more than one person. Don't limit your news or feature to only one person's point of view.

Once you identify your SME, contact him or her and set up a time and location for the interview. Be punctual. Picking the location is as important as picking the SME. Be aware of distractions.

Research comes next. Research is nothing more than digging out information from files and reference works. Research prepares you for the interview, allows you to verify and amplify facts, and gives depth to your products. Below are possible research avenues:

- Military and public libraries (books, consumer magazines, trade magazines, etc)
- *Newspaper morgues* – A morgue contains previously released editions of a publication. Within morgue files, you can retrieve historical and background information as well as ideas that can be refreshed for upcoming stories
- Public affairs guidance, Rhumb Lines, fact files, quick responses, messages, etc
- Maritime strategy
- Fellow MCs who have covered similar or previous events
- *Biographies* – command leadership typically keep their bios up-to-date. Also, these items, as you may remember, are found in welcome aboard and media kits. Flag officer bios can be found in the [Navy leadership](#) section on [Navy.mil](#).
- *The Internet* – One of the most common sources of information today is the Internet. Nearly every Navy command has its own official website. These sites provide valuable information on the makeup of the command, command history and special events. An advantage to using the Internet is that the information is updated regularly and remains more current than other sources. Examples of Navy websites to help in your research:
 - [U.S. Navy](#)
 - [History and Heritage Command](#)
 - [CHINFO](#)
 - [Navy Personnel Command](#)
 - [Naval Education and Training Command](#)

—[Non-Resident Training Courses](#)

—[Defense Media Activity](#)

For a list of all official Navy websites:

—[Links of interest](#)

—[Alphabetical listing of Navy websites](#)

When conducting research, you may discover that the best way to gather information about your topic is through **observation**. For example, you may be writing a feature story about the base gym's new cardio room. Best way to record the sights, sounds and smells of the gym is to go to the gym and observe for a while. Great writers gather not only information from SMEs, but they also look for the colorful, the dramatic or the unusual in any situation. The difference between a good story and a poor one is often in the skill of the observer. Skilled observers use their eyes, ears, minds, notebooks, pens and digital recorders.

In addition to research and observation, you should plan possible questions prior to interviewing your SME. Start with the 5 W's and H, and then build from there. Without good questions, getting the information readers want is nearly impossible.

This is the best time to put together the items you will need for the interview as well. Your interview kit should include at a minimum a notepad and writing utensils. If you plan to use a recording device, ensure it is charged and you have spare batteries.

During the Interview

The time has come for you to conduct your interview. You have planned properly and are ready to gather the information for your story. Well-prepared MCs know planning will be fruitless if the interview itself falls short, however.

Immediately upon greeting your SME, introduce yourself and thank your SME for taking the time to speak with you. This will set the tone for the interview.

Before you jump into your planned questions, break the ice with a few questions to help the SME feel more comfortable going into the interview. Talk about the weather, a recent sporting event, an upcoming command event, etc. Don't dwell too long with the icebreaker questions however.

Other important interviewing techniques:

- Ask for permission to use your recording device. Even if using a recorder, you still need to take notes. With experience, you will develop your own shorthand transcription
 - Listen effectively during an interview. Your body language and eye contact should convey interest and make the interviewee feel at ease
 - Remember you are in control of the interview. You are there to accomplish a purpose and get the information you need to report the story. However, leave your interviewees plenty of latitude to introduce additional ideas.
- Ask open-ended questions, questions that keep the SME talking. Avoid questions that will only elicit a yes-or-no answer, unless you are asking a clarifying question to clear up something.

- Do not interrupt your SME. Let him or her speak. However, if your SME veers off on a tangent, politely steer him or her back on track. If, while on that tangent, your SME brings up something of interest or news value, make note of it. Then, ask the SME if you can schedule a separate interview at another time to cover that topic.
- Don't be afraid to get away from your prepared questions. Use the source's responses as a springboard to additional, follow-up or clarifying questions.
- Ask for clarification. Don't be afraid to ask the interviewee to explain, elaborate or restate important points. Be alert for vague words and follow up by asking specific questions.
- Confirm facts. Read numbers, names and facts back to the interviewee to check your notes.
- Pay attention to the time. Most people take time out of their busy schedules for interviews. Try to stay within the allotted time, but don't be a compulsive clock-watcher. Otherwise, the SME may think you are not interested in what he or she is saying.

After the Interview

Just as a story has a beginning, middle and end, an interview should have a well-executed closing.

- Make an effort to complete the interview on time, but carry on if the interviewee agrees and seems eager to offer other information. To signal your intent to close, review your notes and ask if he/she has any final thoughts or anything to add
- Thank the SME once again for taking the time for the interview
- Leave your business card or contact information and request contact information in return. Ask for the best way to get in touch with him/her for more information or to clear up any facts. Always leave a "foot in the door"
- Review and fill in your notes as soon as possible after the interview. Don't wait or you'll forget what was said and won't be able to decipher your shorthand. It also helps to outline your notes by highlighting good quotes or important points
- You may need to follow-up to fill in "holes" in your story. Ask your subject to confirm, correct or elaborate information missing or unclear in your notes. Remember, the success of an interview depends on the MC's preparation, professionalism and "people skills."

As you progress in your career, you will hone your interviewing skills. The ability to ask questions and listen effectively to the responses will make your stories more informative and interesting, which in turn will increase your readership's interest in your publication.

Personality Interviews

Personality interviews are those conducted for personality features as discussed in Chapter 7. When conducting personality interviews you merge the techniques and processes listed above for interviews and observation. During the personality interview you should make a special effort to observe the subjects appearance, mannerisms, environment and character while asking questions to get into the subject's personality. A good personality feature then blends the results from the interview with your preliminary research and secondary interviews to bring the individual to life.

Telephone Interviews

As discussed, face-to-face interviews are always best. However, there may be times when that may not be possible. In this situation, you may have to conduct a telephone interview. Telephone conversations may range from full-scale interviews to brief queries to verify or amplify information. But regardless of how often you use this method of newsgathering, you should keep the following points in mind:

- Know what information you want before you dial
- Keep your pencil and paper handy
- Be polite and businesslike
- Make sure you get your facts straight. Confirm any questions you may have before you hang up and re-check your information by reading it back to the person who has given it to you
- Ask the other person to repeat figures or spell out names
- Avoid three-way conversations among yourself, the person on the telephone, and somebody else in your office.

Although a telephone is a very useful instrument, remember it is not the only, and not necessarily the best, method of gathering news. It should supplement, but not replace, all other methods.

Prepared-Question Interview

When direct person-to-person or telephone interviews cannot be arranged, some journalists resort to the prepared-question interview, or the sending of questions to the source via e-mail or through assisting personnel (aides). This is typically restricted to interviews with senior leadership, such as the commanding officer. The success of this interview depends on the quantity and quality of information collected from the written interview and your sense of news value and writing ability. A word of caution must be given here. DO NOT use this interview technique without permission from your supervisor or chief. A face-to-face interview is ALWAYS the best method!

News Conference

Since the 1960s, one of the most popular methods of gathering news is through a news conference. By presenting news conferences "live" on television, President John F. Kennedy raised this newsgathering technique into one of the most potent forces in the public exchange of opinion between the people and the government. Today, we use news conferences whenever there is a news event of great importance to the local public or when a prominent official who wants to address the media visits. News conferences establish public esteem, clear up misunderstandings, erase controversy and show the transparency of the Navy by disseminating the same information to the media at the same time.

If you are assigned to cover a news conference, you should treat it like any other newsgathering process. Preliminary groundwork to include research of the person giving the news conference is still a must. During the news conference, you may only have the opportunity to ask one question, so you pay close attention to all other questions and answers being communicated.

Man-on-the-Street Interview

Man-on-the-street interviews (See Figure 8-1) can be used for print or broadcast. During this type of interview, you ask several subjects the same question. This method gives your audience a voice on a particular subject, such as new uniforms, physical fitness, seasonal celebrations, etc. This interview must be accompanied by a still or video camera to show the people being interviewed.

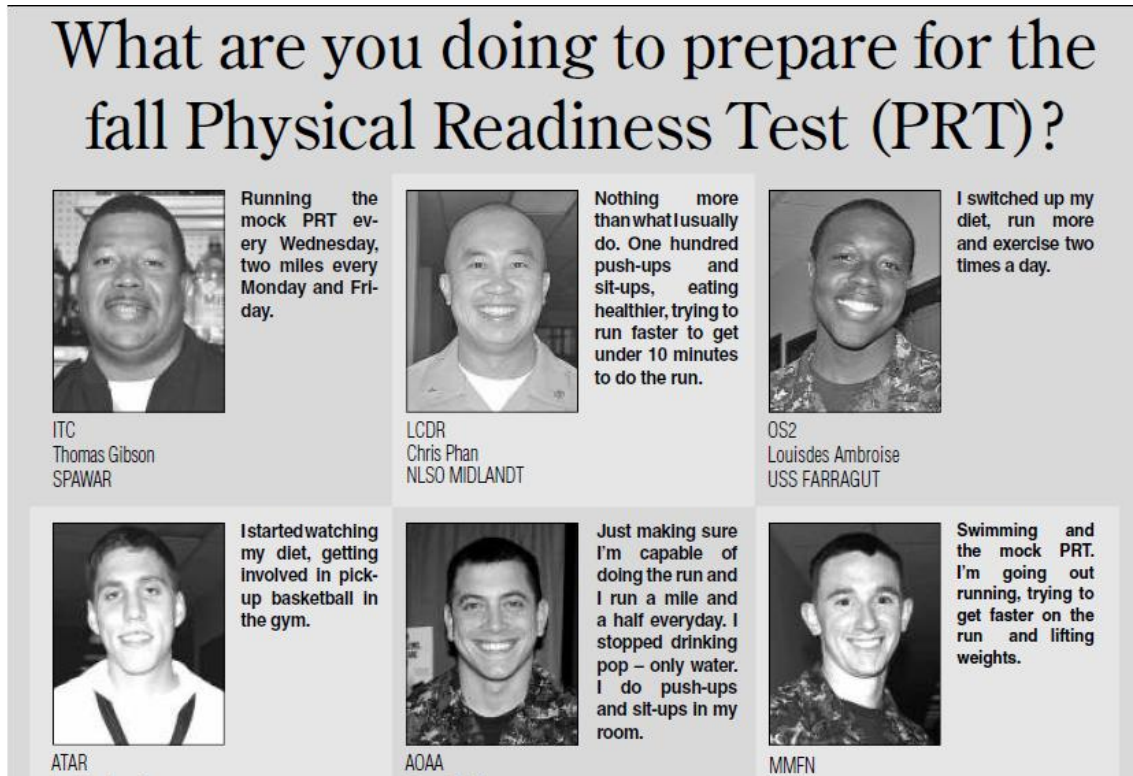

Figure 8-1, Man-on-the-Street.

Multimedia Interviews

Building upon what you have learned in this chapter, you can take these techniques and apply them to interviews to be used on your ship's SITE system or for an All Hands News Update (see Chapter 4). These interviews should be properly and thoroughly planned interviews. The only real difference in this interview is that you will have a video camera through which you will record the subject and/or yourself, depending on the setting. Location is extremely important when shooting a multimedia interview. You may shoot on location or in a studio. However, interviewing in a confined studio space may make your subject uncomfortable.

Remote Interview

The remote interview is conducted on location at a specific event and can be a multimedia or man-on-the-street interview. The major disadvantages of a remote interview are the limitations in station equipment and the lack of control over the environment. Nevertheless, this type of interview gives you the advantage of timeliness.

Sources for Sportswriting

Writing sports is similar to writing news, and so is gathering information for your sports news, with one exception – your sources. Like news writers, a problem for many beginning sports writers is knowing where to gather the needed information. Consider the following sources and note that officials are omitted from the list because they are seldom, if ever, a source of information:

- *Morale, Welfare and Recreation* (MWR) for the ins and outs of recreation, intramural and youth programs, including rules, schedules and official scorebooks
- *Coaches and managers* for details about team members, lineups and rosters, game plans, quotes and information about a contest, especially a contest you did not cover yourself
- *Team members* for accounts of what happened in the game. Be cautious. Many losing teams tend to blame the loss on the officiating, whether they lost by one point or 30 points
- *Official scorers* for game statistics and scorebooks. If you run a box score of the game, be sure your stats match those of the official scorer
- *Fans* for color and sidelight information, where appropriate. Often used in sidebar stories, fan reactions can help tell the story of a team's success or misfortune.

Officials are impartial and usually refuse to comment. If an official's call is vital to the story, do not expect him to explain or justify it unless it is a matter of rule interpretation. Never ask an official about judgment calls (balls and strikes, close calls on the bases, whether a receiver was in or out of bounds when he caught a pass, whether a basketball player traveled, etc.). Officials are, however, legitimate subjects for personality and rules clinic features.

Additional sports coverage guidelines (including help on compiling statistics) can be found in the latest edition of the AP Stylebook.

SUMMARY

In this chapter, you learned about news staffs and about newsgathering. Newsgathering is the foundation of reporting and should become part of your everyday life as an MC. But with anything else, it takes practice.

This chapter also wraps up the public affairs module. The information you have read within these pages is just the beginning. From here, we will shift gears and move on to the visual information side of the MC rating. Module 2 builds upon what you have learned here.

(This page intentionally left blank).

ASSIGNMENT 5

Textbook Assignment: *“Introduction to Newswriting”, Chapter 5.*

5-1. Which of the following is not an element of mass appeal?

1. Timeliness
2. Progress
3. Brevity
4. Conflict

IN ANSWERING QUESTIONS 5-2 THROUGH 5-6 SELECT THE ELEMENT OF MASS APPEAL THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

5-2. First female Sailors report to USS Submarine (SSBN 123).

1. Suspense
2. Oddity
3. Consequence
4. Sex

5-3. 100-percent advancement to MC1.

1. Prominence
2. Oddity
3. Consequence
4. Sex

5-4. Hour-by-hour account of missing Sailor from USS Destroyer (DDG 456).

1. Prominence
2. Oddity
3. Sex
4. Suspense

5-5. Breaking News.

1. Immediacy
2. Oddity
3. Sex
4. Progress

5-6. Annual Army-Navy football game.

1. Oddity
2. Conflict
3. Progress
4. Proximity

4. Literary description

IN ANSWERING QUESTIONS 7-8 THROUGH 7-10 SELECT THE TYPE OF FEATURE LEAD THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

7-8. Chronological, suspenseful opening that tells a story.

1. Summary
2. Narrative
3. Descriptive
4. Direct Address

7-9. Creates an overwhelming curiosity that entices the reader to keep reading.

1. Freak
2. Teaser
3. Summary
4. Narrative

7-10. Speaks to the reader.

1. Teaser
2. Summary
3. Descriptive
4. Direct address

7-11 Which, if any, of the following terms serves as another term for the "bridge" of a feature?

1. Nutgraph
2. Quicklink
3. Narrative
4. None of the above

7-12 Which of the following organizational patterns presents a feature in a logical sequence in relationship to the subject's physical surroundings?

1. Spatially
2. Topically
3. Specifically
4. Functionally

7-13. Which of the following patterns organizes a feature by time and sequence?

1. Spatially
2. Spatially
3. Functionally
4. Chronologically

7-14 Through which of the following conclusions does a feature writer complete an idea, bringing the audience full circle in the story?

1. Climax
2. Stinger
3. Tie-back
4. Wrap-up

7-15. Which of the following feature conclusions solves a problem presented and answers questions?

1. Stinger
2. Wrap-up
3. Tie-back
4. Summary

7-16 Which of the following conclusions fools a reader into expecting an ending then jolts the reader with a surprise, unexpected ending?

1. Climax
2. Stinger
3. Narrative
4. Unending

IN ANSWERING QUESTIONS 7-17 THROUGH 7-20 SELECT THE CREATIVE WRITING TOOL THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

7-17. Gives human qualities to non-living objects, ideas or things?

1. Syntax
2. Anecdote
3. Metaphor
4. Personification

7-18 Compares one thing to another for the sake of beauty, necessity or emphasis without using the words "like" or "as"?

1. Simile
2. Metaphor
3. Hyperbole
4. Personification

7-19. Exaggerates or overemphasizes a point.

1. Syntax
2. Simile
3. Metaphor
4. Hyperbole

7-20. Short, entertaining story that gives insight into a subject?

1. Syntax
2. Anecdote
3. Hyperbole
4. Personification

(This page intentionally left blank).

ASSIGNMENT 8

Textbook Assignment: “Information and Newsgathering”, Chapter 8.

8-1. What is the first step in gathering information for a public affairs or visual information product?

1. Draft a storyboard
2. Identify your audience
3. Schedule SME interviews
4. Format your product template

8-2. Under which of the following beat systems do reporters covers specific areas or locations?

1. Spatial
2. Functional
3. Geographical
4. Hierarchical

8-3. In which of the following beat systems would you find special assignment reporters?

1. Spatial
2. Functional
3. Geographical
4. Hierarchical

8-4. After receiving a news release from the Navy Exchange Command about the rollout of new uniforms Navywide, what must you do prior to publishing the information in your command publication?

1. Draft a quick response
2. Send out a media advisory
3. Localize and rewrite the information
4. Place information in command template

8-5. Which of the following reasons DOES NOT describe a purpose of conducting SME interviews?

1. Reconfirm facts
2. Investigate information
3. Replace need for reference research
4. Add color and dimension to news story

8-6. What are the three most common methods of gathering news?

1. Internet, research and interviews
2. Internet, morgues and interviews
3. Interviews, observation and research
4. Interviews, morgues and observation

8-7 . What percentage of information for a news story should be gathered via some sort of interview?

1. 50
2. 60
3. 75
4. 90

8-8. Upon arriving at your chosen SME interview location, which of the following actions should be completed first?

1. Thank the SME for doing interview
2. Ask permission to use recorder
3. Begin asking icebreaker question
4. Confirm spelling of the SME's name

8-9. If during the middle of an interview, your SME goes off subject and begins speaking of another newsworthy issue, which of the following courses of action should you take?

1. Interrupt SME and immediately ask another question on topic
2. Redirect the interview to the new topic
3. Steer SME back to the original topic and ask if you can return to cover other topic at different time
4. Do nothing; let the SME keep talking

8-10. While conducting a personality interview, which of the following techniques should you apply in order to capture the subject's personality?

1. Shoot photographs during the interview
2. Observe the subject's surroundings, appearance and mannerisms
3. Bring along a second MC to assist in the interview
4. Interview only the subject to ensure you capture his or her perspective only

8-11 Which of the following interview types is the best method of gathering information?

1. Telephone
2. Face-to-face
3. News conference
4. Man-on-the-street

8-12 What former U.S. President is credited with making live news conferences the potent force of information dissemination it is today?

1. Franklin D. Roosevelt
2. Dwight D. Eisenhower
3. John F. Kennedy
4. Ronald Reagan

8-13. During a news conference, how many questions do reporters usually have the opportunity to ask ?

1. None
2. 1
3. 2
4. 3

8-14 Which of the following answers serve as the best reason for conducting man-on-the-street interviews?

1. Lessens workload for MCs
2. Gives audience a voice
3. Other methods make Sailors uncomfortable
4. Increases control of subject matter

8-15. When gathering information for sports story, which of the following sources is NOT a good source of data?

1. AP Stylebook sports section
2. Officials
3. Coaches
4. Scorebooks

(This page intentionally left blank).

Although the words "he," "him," and "his" are used sparingly in this course to enhance communication, they are not intended to be gender driven or to affront or discriminate against anyone.

DISTRIBUTION STATEMENT A: Approved for public release; distribution is unlimited.

Sailor's Creed

"I am a United States Sailor.

*I will support and defend the
Constitution of the United States of
America and I will obey the orders of
those appointed over me.*

*I represent the fighting spirit of the
Navy and those who have gone before
me to defend freedom and democracy
around the world.*

*I proudly serve my country's Navy
combat team with honor, courage and
commitment.*

*I am committed to excellence and the
fair treatment of all."*

THE UNITED STATES NAVY

GUARDIAN OF OUR COUNTRY

The United States Navy is responsible for maintaining control of the sea and is a ready force on watch at home and overseas, capable of strong action to preserve the peace or of instant offensive action to win in war.

It is upon the maintenance of this control that our country's glorious future depends; the United States Navy exists to make it so.

WE SERVE WITH HONOR, COURAGE, AND COMMITMENT

Tradition, valor, and victory are the Navy's heritage from the past. To these may be added dedication, discipline, and vigilance as the watchwords of the present and the future.

At home or on distant stations, we serve with pride, confident in the respect of our country, our shipmates, and our families.

Our responsibilities sober us; our adversities strengthen us. Service to God and Country is our special privilege. We serve with honor.

THE FUTURE OF THE NAVY

The Navy will always employ new weapons, new techniques, and greater power to protect and defend the United States on the sea, under the sea, and in the air.

Now and in the future, control of the sea gives the United States her greatest advantage for the maintenance of peace and for victory in war.

Mobility, surprise, dispersal, and offensive power are the keynotes of the new Navy. The roots of the Navy lie in a strong belief in the future, in continued dedication to our tasks, and in reflection on our heritage from the past.

Never have our opportunities and our responsibilities been greater.

PREFACE

About this course:

This is a self-study course. By studying this course, you can improve your professional/military knowledge, as well as prepare for the Navy-wide advancement-in-rate examination. It contains subject matter about day-to-day occupational knowledge and skill requirements and includes text, tables, and illustrations to help you understand the information. An additional important feature of this course is its reference to useful information in other publications. The well-prepared Sailor will take the time to look up the additional information.

By enrolling in this self-study course, you have demonstrated a desire to improve yourself and the Navy. Remember, however, this self-study course is only one part of the Navy training program. Practical experience, schools, selected reading, and your desire to succeed are also necessary to successfully round out a fully meaningful training program.

COURSE OVERVIEW: In completing this non-resident training course, you will demonstrate knowledge of the subject matter by correctly answering questions on the following subjects: The military postal service, designations and terminations, mail packaging and acceptance, domestic mail, international mail, registered mail, finance, handling and transportation, claims and inquiries, directory service, equipment and supplies, official mail, audits, reports and inspections.

THE COURSE: This self-study course is organized into subject matter areas, each containing learning objectives to help you determine what you should learn along with text and illustrations to help you understand the information. The subject matter reflects day-to-day requirements and experiences of personnel in the rating or skill area. Also, it reflects guidance provided by Enlisted Community Managers (ECMs) and other senior personnel, technical references, instruction, etc., and either the occupational or Naval standards, which are listed in *Manual of Navy Enlisted Manpower and Personnel Classifications and Occupations Standards*, NAVPERS 18068.

THE ASSIGNMENTS: The assignments that appear in this course are designed to help you understand the material in the text.

COURSE OBJECTIVE

The objective of this course is to provide Mass Communication Specialist (MC) with Visual Information (VI).

INSTRUCTIONS FOR TAKING THE COURSE ASSIGNMENTS

The links and material that you are to study are included in each chapter. Study the material and links carefully before attempting to answer the questions. Pay close attention to tables and illustrations, and read the information in the links.

SELECTING YOUR ANSWERS

Read each question carefully, and then select the BEST answer. You may refer freely to the text. The answers must be the result of your own work and decisions. You are prohibited from referring to or copying the answers of others and from giving answers to anyone else taking the course.

SUBMITTING YOUR ASSIGNMENTS

To have your assignments graded, you must be enrolled in the course with the Non-Resident Training Course Administration Branch. Following enrollment, there are two ways of having your assignments graded:

- Use the Internet to submit your assignments as you complete them.
- Send all the assignments at one time by mail to CPPD, NRTC.

Grading on the Internet: Advantages to Internet grading are as follows:

- You may submit your answers as soon as you complete an assignment.
- You get your results faster.
- In addition to receiving grade results for each assignment, you will receive course completion confirmation once you have completed all the assignments.

To submit your assignment answers via the Internet, go to the following site:

<https://www.courses.netc.navy.mil>

Grading by Mail: When you submit answer sheets by mail, send all of your assignments at one time. Do NOT submit individual answer sheets for grading. Mail all of your assignments in an envelope, which you either provide yourself or obtain from your nearest Educational Services Officer (ESO). Submit answer sheets to the following:

*Commanding Officer
Center for Personal and Professional Development
ATTN: VOLED Det. (NRTC)
6490 Saufley Field Road
Pensacola, FL 32509*

Answer Sheets: Each course includes an answer sheet for your assignments. If you are going to mail in your answer sheets, please make copies of the included answer sheet. Explanations for completing the answer sheets are on the answer sheet.

Follow the instructions for marking your answer on the answer sheet. Be sure that blocks 1, 2, and 3 are filled in correctly. This information is necessary for your course to be properly processed and for you to receive credit for your work.

COMPLETION TIME

Courses must be completed within 12 months from the date of enrollment. This includes time required to resubmit failed assignments.

PASS/FAIL ASSIGNMENT PROCEDURES

You will be given the opportunity to resubmit failed assignments. You may resubmit failed assignments only once. Internet students will receive notification when they have failed an assignment; they may then resubmit failed assignments on the Web site. Internet students may view and print results for failed assignments from the Web site. Students who submit by mail will receive a failing result letter and a new answer sheet for resubmission of each failed assignment.

COMPLETION CONFIRMATION

After successfully completing this course, you can download a copy of your letter of completion on the NRTC Web site:

<https://www.courses.netc.navy.mil>

STUDENT FEEDBACK QUESTIONS

We value your suggestions, questions, and criticisms on our courses. If you would like to communicate with us regarding this course, we encourage you, if possible, to use e-mail. If you write or fax, please use a copy of the Student Comment form that follows this page.

For subject matter questions:

Contact the Center for Service Support, Newport, RI

Email: NWPT_CSS_RTM@navy.mil

Phone: 401-841-1057 or DSN 841-1057

For enrollment, shipping, grading, or completion letter questions:

Email: NRTC@navy.mil

Phone: Toll Free 1-877-264-8583

Comm: 850-452-1511

DSN: 922-1511

FAX: 850-452-1370

(Do NOT fax answer sheets.)

ADDRESS:

*Commanding Officer
Center for Personal and Professional Development
ATTN: VOLED Det. (NRTC)
6490 Saufley Field Road
Pensacola, FL 32509*

Privacy Act Statement: Under authority of Title 5, USC 301, information regarding your military status is requested in processing your comments and in preparing a reply. This information will not be divulged without written authorization to anyone other than those within DOD for official use in determining performance.

CHAPTER 1

INTRODUCTION TO VISUAL INFORMATION

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Define visual information.
 - Identify policies outlined in and DoDINST 5040.02 and OPNAVINST 3104.1
 - Explain the missions of Navy Visual News Service, combat camera, and the Defense Imagery Management Operations Center.
 - Discuss the ethics associated with visual information.
-

WHAT IS VISUAL INFORMATION

Welcome to the visual information section of the Basic MC rate training manual. In this module, we will build upon the information discussed in module one, public affairs. As an MC, you will be expected to be well rounded in your public affairs and visual information knowledge, skill and technique.

Visual Information (VI), as described by [Department of Defense Instruction 5040.02 \(Visual Information\)](#), is “information in the form of visual or pictorial representation of person(s), place(s), or thing(s), either with or without sound.” Generally, VI includes still imagery, motion picture imagery, video or audio recording, graphic arts, visual aids, models, displays, visual presentation services and the support processes.

VI is an essential communication tool. Imagery is a powerful weapon in the Navy’s communication strategy and can help counter propaganda and misinformation that have significant effects in the operational environment. The capability to provide information and visual media content that contributes to accurate perceptions and favorable attitudes is critical to achieving national and military objectives.

Navy VI is also a professional visual communication capability closely associated with public affairs. VI products help tell the story of America’s Navy to all of our audiences. The instruction regulating Department of Defense (DoD) VI production procedures is [DoDINST 5040.07](#).

PRIMARY ACTIVITIES and FUNCTIONS

Navy VI translates into the following primary activity missions and functions:

- VI documentation (VIDOC), which includes combat camera documentation, operational documentation (OPDOC), technical documentation (TECDOC) and subfunctions using graphic arts, motion media, still photographic, audio and other VI systems
- VI production in support of Navy operations, training and other functions
- Support of DoD VI records centers
- Ship/shore VI activities which include: motion media production, still photographic production, graphic arts production, and other VI services needed at ship/base level.

VI ORGANIZATION

CHINFO – All aspects of Navy VI fall under the auspices of CHINFO. CHINFO as the CNO's special assistant for public affairs support is responsible for the implementation and administration of the Navy's VI Program. High-quality, timely, truthful and accurate visual communication products aid operational planning and decision making, and can achieve operational effects through its use with external audiences such as the adversary and the local populace. CHINFO also issues policies, doctrine, guidance, direction, planning, assessment, and procedures to implement the VI program:

[OPNAVINST 3104.1](#) (series) (Navy Visual Information Program Policy and Responsibilities) outlines policy for the use, management and assignment of responsibilities for VI within the Navy.

Combat camera, or COMCAM, is the operational and directed imagery component of VI and is covered in detail in the independent guidance, [OPNAVINST 3104.3](#) (series) speaks specifically of Navy COMCAM Program Policy Responsibilities and Procedures.

It is Navy policy to maintain VI and combat camera (COMCAM) resources to provide:

- Rapid deployable of COMCAM assets for the planning and execution of operational imagery documentation of force deployments and activities before, during and after military engagements, operations and emergency actions
- General purpose VI support that satisfies DON and DoD requirements for audiovisual documentation, production, distribution, records centers and installation-level support other than COMCAM
- Dedicated VI support of such activities as medical and intelligence functions and for research, development, test and evaluation (RDT&E)
- Life cycle management of VI, COMCAM and other audiovisual records.

The assistant chief of information for VI (CHINFO OI-7) reports to CHINFO on all VI matters.

Navy Visual News Service (NVNS) is a component under OI-7. Its mission is to provide imagery to national and international media outlets, DoD agencies and other federal agencies as required tell the U.S. Navy story. NVNS is the Navy's primary point of contact for requests by major media outlets for U.S. Navy visual information products both still and video.

As an organization, Navy Visual News Service provides this material directly upon request, while proactively pushing content to our external media customers as important stories and issues develop. For more information on NVNS, check out their [website](#).

Navy VI works in conjunction with Defense Visual Information, who operates the *Defense Imagery Management Operations Center* (DIMOC). DIMOC supports worldwide DoD and other U.S. government agency communication and operational missions with the right imagery in the right place at the right time by providing an enabling architecture to synchronize and integrate the various DoD imagery capabilities and centrally manage current and historical visual information. The DIMOC is an evolving, transformational agency that will move into full capability by February 2011.

To accomplish its mission, the DIMOC manages four distinct, but interrelated programs. They are the Visual Information Operations and Coordination Program, Imagery Management and Distribution, Order Fulfillment, Customer Service Programs. These functions are currently active but will have increased capabilities as the DIMOC moves toward full operating capability.

More information about DIMOC can be found at their [website](#).

Note: Registration is required for this site.

ETHICS OF VISUAL INFORMATION

The VI mission of disseminating "high-quality, timely, truthful and accurate" products looks similar to the ABCs of journalism. As with public affairs, MCs are held to a high standard and must adhere to ethics when creating VI products.

The main issues surrounding ethics in VI are still image and video post-production enhancement and alteration. [DODINST 5040.05 \(Alteration of Official DoD Imagery\)](#) is the governing regulation for VI ethics. As written in the instruction, DoD "imagery is used to make decisions and inform the public. Mission success depends on official DoD imagery being complete, timely and accurate. Anything that casts doubt on DoD imagery will not be tolerated.

Note: DODINST 5040.05, dated June, 6, 2006, officially canceled DoD Directive 5040.5.

Image Enhancement/Alteration

Electronic image manipulation is a powerful tool made available with desktop computers and image-editing software programs. These systems provide a means to effectively and ethically edit and enhance captured media. The photographer either shoots with an electronic camera or digitizes analog imagery into digital media to enter the image into the system. The image is converted into a set of picture elements (pixels) and assigned values for a position, brightness and color. These pixels are entered into the computer, which can rearrange them, change their values, duplicate them or eliminate them.

This operation can alter the image in just about any way imaginable — retouching, adding or deleting visual elements; changing positions of objects; modifying colors; and creating montages of entirely imaginary scenes. When complete, the manipulated image can be delivered as a hard-copy print.

The adoption of electronic imaging raises important ethical questions. With the ability to create images comes the ability to manipulate images easily, completely and transparently. Electronic information, unlike traditional photography, can be radically modified with no loss of resolution or evidence the information has been altered.

According to DoDINST 5040.05, alteration of official imagery is prohibited except as follows:

- Photographic techniques common to traditional darkrooms and digital imaging stations (dodging, burning, color balancing, spotting and contrast adjustment) used to achieve the accurate recording of an event or object are not considered alterations
- Photographic and video enhancement, exploitation and simulation techniques used in support of unique cartography, topography, engineering, geodesy, intelligence, criminal investigation, medical research, development, test and evaluation, scientific and training requirements are authorized if they do not misrepresent the subject of the original image
- The obvious masking of portions of a photographic image in support of specific security, criminal investigation, privacy or legal requirements is authorized by DoD instruction 5040.05

- Use of cropping, editing or enlargement to selectively isolate, link or display a portion of a photographic or video image is not considered alteration. Cropping, editing or image enlargement that has the effect of misrepresenting the facts or circumstances of the event or object as originally recorded is prohibited
- Digital conversion and compression of official DoD imagery is authorized
- Photographic and video post-production enhancement, including animation, digital simulation, graphics and special effects, used for dramatic or narrative effect in education, recruiting, safety and training illustrations, publications or productions is authorized under either of the conditions below:

— The enhancement does not misrepresent the subject of the original image.

— It is clearly and readily apparent from the context or from the content of the image or accompanying text that the enhanced image is not intended to be an accurate representation of any actual event.

Examples of the above-mentioned techniques as they relate to the ethics of VI can be found on the [NVNS training Web page](#).

Maintaining your credibility as well as the credibility of the DoD and the Navy is the bottom line. If we are perceived as trying to deceive the public, whatever we have done electronically to the image will be wrong. If we are perceived as attempting to bring the most accurate representation of reality as we can create, we will have acted ethically in behalf of our profession.

Summary

In this chapter, we introduced you to the visual information side of being an MC. Through the information received here, you now should be able to define VI and should be familiar with the instructions and policies that regulate MCs in their everyday duties in VI. Now, it's time to move on to the fundamentals of visual information. In this manual, we will discuss photography, videography, multimedia and print production. However, in the following chapter, we are going to discuss the theories of light and color.

CHAPTER 2

LIGHTING AND COLOR

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Explain the theory of light.
 - Describe the different types of photographic and video lighting.
 - Explain the differences between CMYK and RGB, as they pertain to the color theory.
-

Before you can master the VI side of being an MC, it is important to understand light and color and how each plays a part in the art of visual communication. Light is the magic ingredient that makes visual information possible. In performing your duties as an MC, you must be aware of how light is reflected, absorbed and refracted.

Color is all around us. Color is a sensation that adds excitement and emotion to our lives. Everything – from the clothes we wear, to the images and graphics we create – revolves around color. Without color, the world would be a duller place. In order to understand color, however, we need to understand light. Without light, there is no color. Without light, there can be no vision or visual information.

THEORY OF LIGHT

Light is reflected from the world around us, making things visible to both our eyes and the eye of a camera. The nature of light has a critical effect on the images you create. Few photographers and videographers actually understand much about light, but they are not alone. Scientists have never been able to agree fully about the nature of light. However, certain useful things are clear.

Science does tell us light is produced in waves. In many respects, the waves of light can be compared to sound waves. Sound waves vary in length and register as different pitches, while light waves register as different colors. Light is made up of energy waves, which are grouped together in what is called a spectrum. Light that appears white to us, such as light from the sun, is actually composed of many colors. The wavelengths of light are not colored but produce the sensation of color.

To the photographer, there are two important characteristics in the way light travels. In a given medium, light travels at a constant speed (constant) and ALWAYS in a straight line.

Visible light – The wavelengths our eyes detect are only a small portion of the electromagnetic energy spectrum. We call this the visible light spectrum (See Figure 2-1). At one end of the visible spectrum are the short wavelengths of light we perceive as blue. At the other end of the visible spectrum are the longer wavelengths of light we perceive as red. All the other colors we can see in nature are found somewhere along the spectrum between blue and red. Beyond the limits at each end of the visible spectrum are the short wavelengths of ultraviolet light and X-rays and the long wavelengths of infrared radiation and radio waves not visible to the human eye.

Incident Light – Light that falls upon a subject from another source.

Figure 2-1, The electromagnetic energy spectrum.

EFFECTS of DIFFERENT MEDIUMS

Once light is produced, or emitted, it is no longer dependent on its source. Only its speed is affected by the many mediums (conflict) through which it can travel. When light travels from air into a denser, but transparent medium, such as a glass, it slows down. But when it leaves the glass, it returns to its original speed.

Transmission – Light is “transmitted” when it passes through a medium. Transparent mediums transmit all light striking them; you see objects behind them quite clearly. Translucent mediums, such as frosted glass, transmit only a portion of the light; an object behind them is not seen clearly.

Reflection – Light is “reflected” when it strikes an object and bounces back. There are two types of reflection – specular and diffused. Specular reflection occurs when light strikes a smooth, polished surface and reflects back at the same angle that it struck the surface. Light that strikes a rough surface is reflected back in many directions. This is diffused reflection. Diffused reflections form the middle tone areas in a photograph; specular reflections form the highlighted areas. Three factors affect reflected light:

- Intensity
- Direction
- Color

Absorption – Absorbed light is neither transmitted, nor reflected. An object that absorbs the light falling upon it is “opaque.” Absorption (the absence of light) forms the shadow areas in a photograph. Most objects are opaque. Both opaque and translucent objects have color because they

reflect certain wavelengths of light. Black objects appear black because they absorb nearly all of the wavelengths of the visible spectrum (see figure 2-2).

Figure 2-2, Effects of Different Mediums.

When speaking of light, black is the absence of ALL light, and white is the presence of all three colors of light (red, green and blue) in equal amounts. White items, such as snow, appear white because they reflect nearly all of the visible spectrum. No object completely absorbs or transmits all light. There is a certain amount of absorption or reflection in every object. If this were not true, we could not see the object. For example, the windows in a car appear to be transparent even though they are slightly tinted. The tint absorbs some of the energy (light) to make the interior of the car cooler. Also, since the surface of the window is highly polished, some of the light is reflected. Transmission, absorption and reflection properties of objects allow us to see objects as well as photograph them.

Bending of Light

Dispersion – Dispersion is the separation of white light into its individual colors, due to the bending of each wavelength to a different degree of angle. A prism can be used to separate white light in this manner. In nature, water droplets that produce a rainbow also cause dispersion of light. A camera lens also disperses light if not corrected. Dispersion is usually undesirable for most photographic purposes. Through the years, lens manufacturers have practically eliminated the occurrence of dispersion. As a result, you do not have to be overly concerned with dispersion.

Refraction – Refraction is the change of direction of light rays (bend) as they enter a medium of a different density. Refraction occurs when light leaves a medium, such as air, and enters a medium such as water, glass or even a vacuum. You probably have witnessed refraction of light in water. A canoe paddle that halfway in the water appears bent at the union between the water and the air. A lens bends light rays in a controlled manner allowing you to capture the scene in front of the camera, recreating it behind the lens and recording the image.

Diffraction – Light is slightly bent and scattered when light passes over the edge of an opaque object. This change of direction of light rays is called diffraction. When an opaque object is placed so that it partially blocks the path of the rays from a point source of light, you can see diffraction as a

fuzzy-edged shadow. An example of this can be seen during a solar eclipse. The outside edge of the shadow is light and indistinct; it gradually fades into the deep black of the shadow. Thus, you can see that some of the light is scattered into the shadow area. In photography, diffraction takes place as light passes over the opaque edge of a camera's diaphragm in the lens-and-shutter system. Camera operations and equipment will be discussed in a later chapter.

POLARIZATION

Energy in the form of wave motion radiates from its source and travels through a medium. For example, when a section of line is secured at one end and the free end is held in your hand and given a shake, a wave travels down the length of the line from the end that was shaken to the secured end just like an oscillator. A light source acts as an oscillator; the wave motion, the line. It does not, however, represent the true wave motion of light, because light waves move at right angles, in all possible directions.

A much clearer picture of light wave motion is demonstrated by having a number of parallel lines with each one being shaken in a different direction – one up, one down, one sideways, others at various angles in between. Ordinarily, light waves vibrate in all directions at right angles to their direction of travel. However, when light waves strike a series of parallel microscopic slots, all the light that passes through vibrates in one direction. This is polarized light. In photography, polarized filters polarize light.

Specular reflected light, from a nonmetallic surface at any angle between 32 and 37 degrees, is polarized in such a manner that the light rays vibrate in a direction parallel to the reflecting surface. Light reflected in this manner is said to be plane polarized and is seen as glare. Reflections from metallic surfaces do not create polarization. However, if you are using the panning technique while you are shooting, you will see the variable darkening of an image.

PHOTOGRAPHIC LIGHTING

By now, you surely realize that light is the most important ingredient in photography. Light makes photography possible by reflecting off the subject, entering the camera and exposing the film or charged coupled device (CCD).

The intensity of light determines the brightness of the subject in relationship to the inverse-square law, see figure 2-3. It demonstrates that light decreases as the square of the distance increases. Becoming familiar with this law will help you use light more effectively during photographic assignments.

Figure 2-3, Inverse-square law.

OUTDOOR LIGHTING

Daylight and sunlight are not constant sources; they change hourly with the weather, seasons and latitude. The changes in daylight can radically alter the apparent shapes, colors, tones and forms of a scene. The color of sunlight changes most rapidly at the extreme end of the day. Strong color changes also occur during storms, haze or mist and on blue wintery days. The direction of the light changes as the sun moves across the sky. The shape and direction of shadows are altered, and the different directions of sunlight greatly affect the appearance of each scene.

The quality of sunlight depends on its strength and direction. Strong, direct sunlight is "hard," and it produces dark, well-defined shadows and brilliant highlights. Sunlight is hardest on clear summer days at noon. Strong sunlight makes strong colors more brilliant, but weak colors pale. Sunlight is diffused by haze, mist and pollution in the air. This diffused or reflected light is softer, and it produces weak, soft shadows and dull highlights. Directionless, diffused sunlight is often called flat lighting. It produces fine detail but subdues or flattens form. In weak, directionless sunlight, colors are muted, but strong, directionless, flat sunlight provides vibrant, well-saturated colors.

Take a look at the two pictures below, paying close attention to the differences in how the bricks look. The differences are created by using different lighting techniques.

Figure 2-4, Frontlighting.

Figure 2-5, Sidelighting.

Photos by JOCS (AW) Jon Gagné (retired)

Frontlighting

The old adage about keeping the sun at your back is a good place to continue our discussion of outdoor lighting. The type of lighting created when the sun is behind the photographer is called *frontlighting* (see figure 2-4). This over-the-shoulder lighting is typically the first photographic advice amateur photographs receive. However, it may not be the best type of lighting. Over-the-shoulder lighting produces a flattened effect, doing nothing to bring out the detail or to provide an impression of depth. The eyes see in three dimensions and will compensate for unhelpful lighting. However, a photograph is two-dimensional. To give an impression of form, depth and texture to the subject light your object from the side or at an angle.

Sidelighting

As you gain experience with various types of outdoor lighting, you can achieve different effects by changing the angle of the light falling on your subject. As you turn your subject, change camera viewpoint or wait for the sun to move. Look at the brick wall photo once again. The sidelighting creates shadows in every crevice (see figure 2-5). The effect increases as the light is more parallel with the wall until long shadows fall from the smallest irregularity in the brickwork. This can give an almost three-dimensional effect to a photograph.

Sidelighting is particularly important with black-and-white photography, which relies on gray tones, rather than color, to record the subject. Shadows caused by sidelighting reveal details that can create striking pictures from ordinary objects that otherwise would not be worth photographing in black and white. Anything that has a noticeable texture — like the ripples of sand on a beach — gains impact when lighted from the side. Landscapes, buildings and people look better when lighted from the side.

In color photography, color gives the viewer extra information about the subject, making up for a lack of texture in frontlighting, but often the result is much better when lighted from the side.

U.S. Navy photo by MC3 Spencer W. Mickler

Figure 2-6, Backlighting.

Backlighting

When the sun is in front of the photographer, coming directly at the camera, you have what is referred to as *backlighting* (see figure 2-6) — that is, the subject is backlit. This type of lighting is effective for images of people outdoors in bright sunlight. In bright sunlight, subjects that frontlighted or even sidelighted may be uncomfortable and squint. Backlighting helps eliminate this problem. Backlighting may require the use of a reflector or fill-in flash to brighten the dark shadows and improve subject detail. Backlighting also is used to produce a silhouette effect. When you use backlighting, avoid allowing sunrays to fall directly on the lens (except for artistic special effects). Use a lens hood or some other means of shading the lens to prevent lens flare.

EXISTING LIGHT

Existing light, sometimes called available or natural light, is light that is already on the scene. This includes light from table, floor and ceiling lights; neon signs; windows and skylights; candles and fireplaces; automobile headlights and any other type of light that provides the natural lighting of a scene — except daylight outdoors. Moonlight is considered existing light. Existing light is found in homes, offices, hangar bays, chapels, clubs, sports arenas and so on. Outdoor scenes at twilight or after dark are also existing light situations.

Photography by existing light produces pictures that look natural (see figure 2-7). Even the most skillfully lighted flash image may look artificial when compared to a good existing light photograph. With existing light photography, the photographer has an opportunity to make dramatic, creative pictures. Existing light allows the photographer greater freedom of movement because he is not burdened with extra lighting equipment. Subject distance, when not using flash, has no effect on exposure, so you can easily photograph distant subjects that could not otherwise be photographed using flash or some other means of auxiliary lighting. With existing light you can make pictures that you could not make with other types of lighting.

For example, flash may not be appropriate during a change-of-command ceremony or chapel service. Not only might the flash disturb the proceedings, but it also may not carry far enough to adequately light the subject.

U.S. Navy photo by MC3 Marie Brindo-Vas

Figure 2-7, Existing Light.

Fluorescent Lighting

Indoor scenes illuminated by fluorescent lights usually appear pleasing and natural in real life. However, color pictures of these same scenes will often have an overall colorcast that makes them look unnatural. Fluorescent light is deficient in red light and emits primarily blue and green light. Most color photographs made without a filter under fluorescent light are deficient in red and have an overall greenish appearance. When used correctly, fluorescent light does have some advantages over other types of available light. A room illuminated by fluorescent lamps is usually brighter and more evenly lighted than a room illuminated by tungsten lamps. This higher level of light makes it easier to get enough exposure for your existing light photography and helps record detail that might have been lost in the shadow areas with other types of existing light.

When you are photographing people, fluorescent lighting often causes dark shadows under the eyes of the subject. This effect causes the eyes to appear dark, sunken in and unflattering.

ELECTRONIC FLASH LIGHTING

INTRODUCTION to FLASH PHOTOGRAPHY

A photo is created when light emits from an external source and reflects off different objects. But, sometimes, you may find yourself in a situation where you don't have enough light, such as in a dark place or at night. In this situation, you could set your camera for a longer exposure, but that is not always practical. Instead, you may opt to use a flash unit. A flash provides the necessary light for the scene you wish to capture.

Photography as we know it dates back to the 19th century. From the start, early photographers began looking for solutions to their lighting issues as discussed above. The first flashes they created were made of magnesium powders and other materials that when ignited created a short burst of light. Naturally, blowing up noisy smoky compounds for a photo was quite unpleasant. In using this "flash" mechanism, the photographer opened the lid of the lens (shutter), held the magnesium ribbon in his hand, lit it and immediately covered the lens and walked away before the people in the photo began to complain about the smoke. Today, flashes work much more efficiently and comfortably than 150 years ago.

Flash Operation

- Batteries – Flash units require an energy source, most often 1.5-volt batteries better known as "AA batteries"
- Capacitor – Most flash units have two capacitors, a main and a secondary, to store large amounts of electricity from the batteries. The power from the batteries is augmented from 1.5 volts to about 300 volts in the capacitors. While the capacitors charge, you can hear a high-pitched sound that anticipates the flash's fire
- Transformer – This device augments the power (from 300 volts to thousands of volts) and delivers the power to the flash's lightbulb
- Lightbulb – The lightbulb is a glass cylinder filled with xenon gas, which usually doesn't conduct electricity. In the flash process, electricity is conducted from the secondary capacitor with voltage of thousands of volts in order to ionize the xenon and turn it into a conductor for free electrons. After that, the main current is delivered from the main capacitor to the bulb and is converted to photons – meaning light. Naturally, this whole process happens in a "flash." After the flash is drained of power, the process repeats itself.

When the camera measures light, it accounts for the light being reflected off the subject. When using a flash unit, however, the camera shoots a tiny pre-flash before the actual flash to measure the light reflecting off the subject. The flash intensity for the flash is determined according to this measurement. This is known as through-the-flash metering, or TTL. For a detailed explanation, read about TTL in the manual that came with your flash unit.

Every flash also has a guide number (GN), which measures the intensity of the flash. The number is listed in meters according to ISO 100 (ISO = International Standards Organization's standardized industry scale for measuring sensitivity to light). To double the GN, you increase the energy fourfold.

When using a flash unit, the GN comes in handy when you need to determine the relevant working distance, or the distance your subject should be from the camera. The formula $GN \div \text{aperture} = \text{relevant working distance}$. For example, if your flash has a GN of 42 and your aperture setting is f/4, the relevant working distance is $42 \div 4$, or 10.5 meters. In other words, your camera should be no more than 10.5 meters from your subject.

NOTE: The aperture is the opening through which light passes through the lens. The aperture is controlled by an adjustable diaphragm or iris. Each setting of diaphragm is known as an f/stop (f-stop) and is always read as a number.

The relevant factors that affect exposure when using a flash:

- **Shutter Speed** – The shutter on a digital camera is a mechanical device that opens for a specific amount of time, allowing a set level of light to enter the camera through the lens. The speed of the shutter doesn't influence a subject's exposure when flash is used, because the flash is faster than the fastest shutter speed. This is why the shutter speed only affects the background exposure and any ambient light falling on the subject
- **Aperture** – The aperture is the main factor affecting the exposure with flash photography, because it determines the amount of light entering the lens. As a rule, use the widest aperture you can (the lowest F number) in order to use the flash most efficiently. If we close the aperture down too small, then the flash might not be strong enough, or it may become too strong in compensation and blind the subjects
- **Sensitivity** – ISO is the number indicating a digital camera sensor's sensitivity to light. The higher the sensitivity, the less light is needed to make an exposure. Shooting at a lower ISO number requires more light than shooting at a higher number
- **Working distance** – The distance between the camera and the subject is one of the most influential factors on exposure in flash photography. You need to keep your subject within the flash's range. In a case where several subjects are being lit, it's recommended to keep them as close to the same plane as possible from the flash in order to guarantee even lighting
- **Flash compensation** – Most advanced cameras have an option of positive or negative flash compensation. This function gives you more control on the scene's exposure by overexposing or underexposing the subject.

Synchronizing speed

When the flash unit coincides with the camera's shutter, light hits the camera's electronic image sensor. This is measured in synchronization (sync) speed. In single lens reflex (SLR) cameras, when using high sync speeds, the shutter exposes the film in several stages and not just once. This is why the synchronizing speed of the flash is limited to the maximal single exposure speed of the film/sensor. In most cameras, the synchronizing speed stands at 1/250. In some digital cameras, this problem is solved by using an electronic shutter instead of a mechanical shutter. Before using a flash, you should review its manual for information on sync speeds.

Flash photography modes

Flash units can be set to different modes, depending on how much light you want on your subject.

- Automatic flash – Automatic flash is the simplest mode for novice photographers. In this mode the camera decides when to activate the flash. It's recommend you use your judgment instead of automatic flash
- Red eye – The "red-eye" effect is the appearance of red eyes on images captured while using a flash. The light of the flash occurs too fast for the iris of the eye to close the pupil. The flash then illuminates the blood-rich retina at the back of the eye, resulting in a red appearance of the eye on the photo. The "red-eye" effect can be prevented in a number of ways
 - Moving the flash away from the camera lens (off camera flash) is the most preferable method. Using this method, the flash does not enter the eye directly. The light reflected by the retina is not be captured by the camera's lens, thus the eyes appear natural.
 - Another method is to take pictures with no flash.
 - Many modern cameras precede the flash with a period of bright light – the "anti-red-eye system" – allowing the iris to close. Professional photographers prefer the former approaches, as this system does not always prevent red eyes.
- Slow synchronization – Slow synchronization is used in night photography when you want to activate the flash and maintain a low shutter speed in order to expose the background. The regular synchronizing speed is usually at a minimum of 1/60, and longer exposures permit enough light from the background to enter the lens. When using this method, a tripod should be used
- Rear curtain – Rear curtain offers the ability to fire the flash at the end of the exposure to freeze motion. When making long exposures while firing a flash, rear curtain creates the effect of motion blur trailing the main subject
- Fill flash – Fill flash is a technique used to brighten deep shadow areas, typically outdoors on a sunny day. Fill flash is useful any time the background is significantly brighter than the subject of the photograph, particularly in backlit subjects. To use fill flash, the aperture and shutter speed are adjusted to correctly expose the background, and the flash is fired to lighten the foreground.

External Flash

Most cameras used today come equipped with a built-in flash, but you may find an external flash produces higher-quality images.

- *Power* – An internal flash is weaker compared to an external flash. This is because there is less room for the flash apparatus we learned about earlier, such as the capacitors, bulb, transformers and the batteries. A built-in flash uses battery power from the camera, while an external flash relies on its own energy source, resulting in a significantly stronger flash
- *Red eye* – An external flash solves the problem of red eye, because the distance between the external flash and the lens is great enough so the angle won't allow light to be reflected off the retina back into the lens
- *Attachment* – There are varieties of ways to attach a flash to a camera:
 - "Hot shoe" – The hot shoe is a metal groove with several contacts on its bottom to slide on the flash.

— Synchronizing cable and special flash adaptor.

- *Through the Lens (TTL)* – TTL spares us the need to manually adjust the flash before every photo. There are several variations on the method such as A-TTL, I-TTL, E-TTL etc. The differences between the methods involve light-measuring techniques. A flash working on TTL fires without a preliminary flash and measures the correct exposure, while the flash is shooting. It stops the flash when the result has been achieved
- *Zoom Flash* – Advanced flashes are equipped with zoom heads that adjust according to the lens' focal length. In a wide lens the light is dispersed in the space. In a narrow lens it is focused on a narrow area in a more efficient way to enable it to reach a longer distance
- *Fast Synchronization* – The sync speed of the camera is limited. But sometimes the need arises for faster shutter speeds, such as in strong daylight. This is why "fast synchronization" was developed. The flash emits a series of ultra rapid fires one right after the other throughout the exposure and by doing that exposes the film (or the sensor) to light in each stage of the exposure. The disadvantage of this mode is that the intensity of the flash becomes much weaker because instead of one strong flash there are a lot of short weak ones. This is also the reason why the shorter the exposure speed is in fast sync so will the flash intensity be lower (it flashes less times) until even from a distance of a meter at speeds of 1/4000 it will be difficult to achieve good exposure. In electronic shutter speeds you can use higher shutter speeds than in mechanic shutter cameras
- *Strobe* – In this mode the flash fires several short flashes for about half a second. It is a good mode if you want to see how shadows fall in the scene or if you want to achieve special effects such as motion or freezing action. In today's digital world this is a less meaningful function, because you can shoot a picture and see on the screen exactly how the shadows fall
- *Slave flash* – A slave flash is not located on the camera; it is activated as a reaction to another flash. The firing mechanism is a reaction to the light emitted from another flash or through a wire/wireless connection in more advanced flashes. The first flashes fire in a predetermined intensity while the second fires according to the light measured by the camera as the data are transferred through the wires (or air in the wireless mode)
- *Repeat* – Ultra-fast flashes are determined by the flash frequency per second and the length of the flash. For example, a frequency of 20 flashes per second for half a second will cause 10 flashes. This is used mainly for creative effects in photography, such as freeze framing.

When purchasing a flash for your camera, you should look for one from the same manufacturer as the camera since the communication between them is best. Remember, reading the manual before use is strongly encouraged.

Flash Techniques

There are two main techniques with flash photography – direct flash and bounce flash.

Direct Flash – The flash is directed straight forward toward the subject. It is characterized with harsh shadows and a little lighting from above.

Bounce Flash – To bounce your flash means to reflect it off of another surface before it flashes upon your subject. When using this technique, it is important to use surfaces light in color, preferably white, so the flash reflected will be in the color of the surface from which it was bounced. This technique is one of the better methods to illuminate a subject or scene with a single-flash unit is to

use *bounce flash*. There are times when you want a very soft light in order to lessen the tonal range between highlights and shadows and to soften harsh background shadows:

- Using a ceiling - The flash is aimed at the ceiling. An advanced flash knows that it is pointing to the ceiling and will compensate for the long way it has to go with TTL. The result if lighting from above is also called butterfly lighting, and it is soft due to the diffusing qualities of the ceiling.
- Using a wall - The flash is pointed to a bulkhead or wall. Flash measurement is done the same as bouncing off the ceiling, and the result is quality lighting from one side also known as window lighting or Rembrandt lighting.

Diffuser – A flash typically creates strong contrasts in the lighting with sharp shadows because of the small size of the light source. A good way to overcome this disadvantage is by using a diffuser. The diffuser is made of plastic and is placed on the external flash. Its job is to soften the light and create gentler shadows and soft uniform lighting. A diffuser is highly recommended in direct flash photography. Take into consideration you have to increase your flash's intensity to get the same illumination with a diffuser. In a photo studio, you can use more effective diffusing methods – umbrellas, soft boxes, etc. – to diffuse the light further and to create very soft and pleasant shadows.

OPEN FLASH – Flash photographs can be produced without the camera shutter and flash being synchronized, using a technique called open flash. In the open-flash method, the camera shutter is set at T or B, the shutter is opened, the flash unit fired, and the shutter closed. The open-flash technique is sometimes used when the level of light over a large scene is very low or at night. This method of flash photography allows the photographing of large scenes that ordinarily are quite difficult to illuminate with artificial light. The photographer can walk into a scene with the flash unit and illuminate sections of the scene or the entire scene. Any number of flashes can be used during the exposure while the shutter remains open. A silhouette of your body can be recorded if your body gets between the flash and the camera. To arrive at the exposure for an open-flash image using a manual flash, determine your flash-to-subject distance and f/stop. Keep the distance equal to the objects being illuminated when using manual flash. For example, when the f/stop for the scene is f/5.6 based on a flash-to-subject distance of 10 feet, every flash within the scene should be 10 feet from that section of the scene being illuminated. When an automatic flash is used, the flash automatically shuts off when the proper amount of light is reflected from the subject, providing the object is within its distance range. When you are using a manual flash, the exposure for open flash is determined as previously discussed. This is true unless two or more flash units with equal intensities are used at equal distances or two or more flashes from the same unit at the same distance are used to illuminate the subject.

In the paragraphs above, you learned about the importance of lighting to the photographer. The flash is a unique and advanced device that enables us to shoot in situations where the available light is working against us. We've learned how it all began, how the flash is built and how it works, what an external flash is and its advanced functions, and how to make the most out of your flash. The possibilities are endless. As always, the best way to learn is to put the theory into practice.

Before we move on to video lighting, however, it is important to take a step aside and talk about color.

COLOR THEORY

Think about a bright, red apple on a dark, green tree. Color is not an inherent property of these objects. In fact, color is not even inherent to light. What you see is a visual perception stimulated by

light. The apple and the tree are only visible because they reflect light from the sun. The apple appears red and the tree appears green, because they reflect certain wavelengths of light more than others. In this case, the human eye sees these particular wavelengths as red and green.

When we see a color, we are simply seeing light of a particular wavelength. When a beam of light has a relatively even mixture of light of all visible wavelengths, it appears as white light. When this beam of white light is passed through a prism, its different wavelengths are spread apart and form a visible spectrum. This visible spectrum is seen as a band of colors, such as violet, blue, blue-green, green, yellow, and red.

Figure 2-8, Color Star.

The color star shown here (see figure 2-8) is the foundation of color theory. The design of the star is very simple. The primary colors are R (red), G (green), and B (blue). The secondary colors are cyan (C), yellow (Y), and magenta (M). Combining the two colors on either side of the color that is to be produced can produce any color on the color star. Example: $Y + C = G$ or $G + B = C$. If a green filter and a cyan filter are placed in front of a white light the resulting light will be blue. The colors that are opposite of each other on the star are called complements (opposites). Y and B are complements, C and R are complements, and G and M are complements. When magenta is added to a print, at the same time and same amount, green is being subtracted. Complementary colors are directly related to each other.

COLOR TEMPERATURE SCALE

The color temperature of light is measured according to a scale of degrees in Kelvin ($^{\circ}\text{K}$), which indicates the proportion of red light to blue light radiated by the light source (the sun, electronic journalism lights, fluorescent lights, etc.). Daylight is a combination of all the light rays in the visible spectrum, but daylight contains a higher proportion of blue than some other sources. Tungsten halogen lights commonly used in video lighting also contain all the light rays of the visible spectrum, but with a higher proportion of red hues.

Remember ...

- Daylight ☞ Blue
- Television light ☞ Red

Color temperature is a way of measuring (in units derived from the Kelvin temperature scale) and describing the color quality of white light by comparing it to a theoretical black body heated to a specified temperature on the Kelvin scale (see figure 2-9). It's important in the design and use of computer monitors, solid-state displays and digital cameras.

Figure 2-9, Color Temperature Scale.

As MCs, we need to understand color temperature, because we use equipment that doesn't see true colors like we do with our eyes. Knowing that outside light, inside lights and camera lights have different color temperature, you should gather that it's bad to mix these light sources. Instead, you should eliminate all but one light source when you are shooting. For example, shooting indoors near windows is challenging. The outside light creates blue light (around 5600°K), and the inside fluorescent lights are about 3200°K. To avoid having color issues with your product, you could:

- Get away from the windows (best choice)
- Match outdoor light coming in by putting blue gels on your lights, and make them match the incoming blue light
- Place an amber gel sheet over all the windows to match the 3200°K lights you're using.

Video lights normally run at about 3200°K. However, you may find that some studios lights are 5600°K, similar to lighting outdoors. The 5600°K lights often are found at indoor sports arenas, such as the Louisiana Superdome. If shooting in one of these arenas you need to use an outdoor filter on your camera for 5600°K.

Most professional grade video cameras have a filter wheel such as the found in figure 2-10. The filter wheel is used to achieve a proper white balance.

Figure 2-10, Filter wheel found on the Ikegami 201W ENG Camera.

For the camera shown in the image above, the filters are used as such:

1. Shooting indoors 3000°K (clear filter)
2. Outdoor bright sunny 5600°K (darker filter like sunglasses)
3. Outdoor cloudy/overcast 5600°K (not so dark but still like sunglasses)
4. Outdoor very bright and sunny with snow or water (rarely used).

WHITE BALANCE

The term *white balance* refers to the process of balancing color when shooting images. When white balancing, you are defining for the camera what the color white looks like in specific lighting conditions, which also affects the hue of all other colors. Usually the automatic white-balance function of a video camera operates sufficiently in the automatic position for you; however, some situations will require manual white balancing:

- When the light reflecting from the subject is different from the light that is illuminating the video camera
- When shooting a monochromatic subject or the subject is against a monochromatic background
- When recording under a sodium lamp, mercury lamp or a white fluorescent lamp
- When recording outdoors under neon lights or fireworks
- When shooting scenes just before sunrise or right after sunset.

To white balance a motion-video camera manually, you can follow a simple procedure. Normally a white lens cap, made of a diffuse plastic material, is supplied with the camera. You also can use any white object to white balance the camera, providing the white object is illuminated under

the same conditions that you will be shooting. To white balance, you simply place the white lens cap over the lens, point the camera at the light source, and press the white balance button. Remember, when in the manual white-balance mode, if the color temperature of the light changes, you must reset the white balance.

To create special effects, you may want to "lie" to the white balance sensor; for example, you may want to produce motion video that has a warm color balance, such as that which occurs at sunrise or sunset. To produce video coverage with warm characteristics, you can "white balance" the video camera on a blue object or any of the complementary colors. When you record the scene, an overall yellow cast is produced. You can also use filters to create various effects.

VIDEO LIGHTING

Now that we have discussed light and color, it's time to move on to video lighting. Knowledge of light and color is essential to every MC. When shooting video, we use lighting for visibility and quality. The images you shoot for photography and video must add to the communicative qualities of the story or spot. The light from a scene being captured with a video camera are changed to electrical impulses when exposed to a camera's CCD. Even though most modern cameras are capable of shooting in extremely low lighting conditions, you still may not produce a quality image. If the images are dark and grainy for no apparent reason, you distract from the message and lose your audience.

We cannot always create light where and when we want it, but we have tools that allow us to create lighting that does more than just provide enough light for the camera to pick up an image. Lighting schemes also enhance the communicative qualities of video. Lighting is an art form. The three main goals of video lighting are:

- Fulfill the technical requirements of the camera
- Add a three-dimensional look
- Draw attention to an object

THREE-POINT LIGHTING

The three-point lighting technique (see figure 2-11) is a proven method within the broadcast industry and is used with film, still photography and multimedia products. This method is also good for conducting on-camera interviews with one subject-matter expert (SME).

With this technique you use three lights – a key light, a fill light and a back light.

- *Key Light (Modeling light)* – The key light is the main light and is usually the strongest (about 500 watts). This rectangle-shaped light has the most influence on the look of your scene and is used to light your subject's face. The key light is placed to one side of the camera/subject, so that the side is well lit and the other side has some shadow. It's also used to control the direction of the shadows
- *Fill Light* – The fill light "fills" in shadows and provides detail to your subject's face. The fill light will not fill in all shadows, however, so you will need a slight shadow from the key light
- *Backlight* – Opposite the key light, the backlight illuminates the subject's back to separate him or her from the background, creating a three-dimensional look.

Important facts to know about three-point lighting:

- Opt for a key-to-fill-light ratio of 2:1. In other words, the key light needs to be two times more intense than the fill light. For example, your key light could be 500 watts and your fill light 250 watts
- Key light placement:
 - 35-50 degrees to the left or right of the camera
 - 35-50 degrees above the subject
- Fill Light placement – 35 to 50 degrees to the side of the camera opposite the key light side again, above the subject 35-50 degrees. Remember, you will have a shadow from the key light. A shadow is fine but make sure you lessen it with the fill light
- Back Light – 35 to 50 degrees behind and to the side of the subject. You want it the same height as your key and fill (35-50 degrees above). The back light is best used opposite the key light (see figure 2-11)

Although three-point lighting is typically the standard, there are instances when you will need to adapt your lighting technique.

Figure 2-11, Three-point lighting.

BACKGROUND LIGHT

The third light in studio portrait lighting is the background light. A background light is usually placed on a low stand midway between the background and the subject. When adjusted correctly, the background light provides good tonal separation between subject and background. The intensity of the light falling on the background should not normally be greater than the intensity of the light from the main light falling on the subject's face. By increasing or decreasing the intensity of the light on the background, you can control the tone or color reproduction of the background in the finished print.

SUN GUN

A sun gun is the name for a light mounted on top of a camera. You also may hear it referred to as a tota light, top light or camera light. These lights sometimes come with a filter attached to it called a dichroic filter. Its purpose is to match the sunlight when used during the day. If you turn it on inside, you will see it has a bluish color as if shooting outdoors. For the best lighting at an outdoor ENG (electronic newsgathering) shoot, the talent should be placed with the sun to his or her right.

LIGHT DIFFUSION

To give your image a softer, more natural light, with undefined shadows you can use diffusion material over the lights – material such as spun glass (tough spun), heat-resistant plastic, metal window screen, and a metallic mesh (scrim). Diffusion materials reduce glare and harshness in your scene. Diffused light makes people more comfortable as well.

BOUNCE LIGHTING

The bouncing of light spoken of in the photography lighting section also comes in handy when shooting video. Bouncing light produces soft, natural lighting and reduces glare and harshness. You can bounce your lights off of walls and ceilings or use lighting umbrellas. Be careful when bouncing light; however, because if the surface is not white, your light will be mixed with another color.

No other tool at your disposal will do what light can do for the look, feel, and mood of your productions. When you apply these lessons and use your camera and light kit, you'll increase the effectiveness of your productions and the command information messages you craft.

FUNDAMENTAL PORTRAIT LIGHTING

The success of a portrait is equally dependent on lighting as on the pose of the subject. The manner in how the subject is lighted can actually set the mood of a portrait. The best portrait lighting will simulate natural sunlight. This is because we are accustomed to seeing faces illuminated from above and to one side with shadows cast downward and on one side or the other. Light coming from below eye level casts shadows upward and produces an unnatural, ghastly effect.

Good portrait lighting shows off the subject to the best advantage, emphasizing the form and expressiveness of the facial features. When lighting appears pleasing and natural in a portrait, it produces prominent highlights on the forehead, nose, cheeks, and chin with enough shadows to round out the facial features.

Lighting for a studio portrait normally requires at least two lights. One of these is the *main*, *modeling*, or *key* light; the other is the *fill* or *fill-in* light. Portrait lighting is divided into various types called lightings. Some of these lightings are as follows: broad, short, butterfly, Rembrandt, split, and rim. These names have been assigned because of the visual effects the lighting creates when it falls on the subject from a given direction.

This visual effect is derived from the modeling light. Other light sources that may be added to the *modeling light* to enhance the subject are as follows:

- *Broad lighting* – The main light completely illuminates the side of the face turned toward the camera.

- *Short lighting* – The main light completely illuminates the side of the face turned away from the camera
- *Butterfly lighting* – The main light is placed directly in front of the face and casts a shadow directly under the nose.
- *Rembrandt lighting* – This is a combination of short and butterfly lighting. The main light is placed high and to the side of the face turned away from the camera and produces a triangle of light on the side of the face in shadow.
- *Split lighting* – The modeling light is placed to light completely one side of the face while placing the other side of the face in shadow.
- *Rim lighting* – The modeling light is placed behind the subject and places the entire face in shadow.

MAIN LIGHT

The main light as mentioned above is also known as the modeling light, because it is used to model the face (or subject). The main light creates a three-dimensional effect by either emphasizing or de-emphasizing the curvature and characteristic features of the face with highlights and shadows. The modeling light should always be the one dominant light source in a portrait because it controls the direction of the shadows.

The direction of the main light establishes four basic portrait lightings – *three-quarter lighting*, *sidelighting*, *frontlighting* and *backlighting*. When reading other books on portrait lighting, you will often encounter other names depending on what the author wanted to call the lightings. You, as an MC, will mostly be concerned with three-quarter (broad and short) and front (butterfly) lighting. We also designate each of our lightings as high, medium, and low for vertical position. To go further, we designate the lighting as right or left of the subject. These lighting positions change with each subject. When setting portrait lights, you should always study the effect and view the subject from the camera position, preferably through the viewfinder.

THREE-QUARTER LIGHTING

Broad and short lighting are two types of three-quarter lighting, and they are the types that you most often use for official portraits. The only difference between the two is the position of the main light and the way it illuminates the subject.

Short lighting is used for people with a normal-shaped face or people who have a wide face. When short lighting is used, the side of the subject's face that is away from the camera is illuminated. This puts the side of the face toward the camera in shadow. By putting the side of the face toward the camera in shadow, you can provide a slimming effect.

Broad lighting is useful for subjects with a narrow face. When broad lighting is used, the side of the face toward the camera is illuminated, and the side of the face away from the camera is in shadow. This provides a widening or broadening effect of the face (see figure 2-12).

Main lighting only

Broad lighting
with fill light

Figure 2-12, Short and broad lighting.

Flexibility of Three-Quarter Lighting

Three-quarter lighting can be used with almost any type of face. It is flexible because once it is set, the subject can move his head from full face to profile and the lighting remains good at any point you choose to pose the sitter. The degree of flexibility is determined by the type of light used (spot or flood) and the size and type of reflector used.

MAIN LIGHT DISTANCE

The power or intensity of the main light is not the determining factor for the distance the main light is placed from the subject. It is the visual effect the light has on the subject that determines this distance. When the main light is too high and close to the subject, there may be too much light falling on the forehead and not enough light falling on the lower part of the face. This effect can be improved by moving the main light farther away from the subject and placing it correctly. Highlights on the forehead, the upper cheeks, the chin, and along the bridge of the nose are created by the main light. These highlights give life, brilliance, and form to a portrait, and the quality of these highlights is controlled by the main light distance.

To determine the main light distance, start with the light about four feet from the subject and about two feet above the subject's eye level. The light should be about a 45-degree angle to the lens axis. Observe the forehead highlight and move the light closer to the subject. As the light gets closer to the forehead, highlights spread out to a large, flat area and begin to wash out.

Now, start moving the main light away from the subject. As you slowly move it back, you will find there is a point where the forehead highlight becomes relatively small and bright. When the light is moved back much further from this point, the highlight spreads and disappears. Between the point where the highlight is brightest and where it starts to disappear lies the range where the highlight still has character. This point is where you get the most pleasing effect. Once you have found the distance where the main light gives your desired effect, the *distance* should remain the same regardless of the *direction* you need to move the light. This main light distance should always be considered as the *starting* point of portrait lighting.

MAIN LIGHT HEIGHT

To determine the correct height for the main light, move the light directly in front of the subject while maintaining the distance determined for the forehead highlight. Raise or lower the light until the shadow cast by the nose is just long enough to touch the top edge of the upper lip. This is the height the main light should normally be no matter at what position you place it in an arc around the subject. When your subject is wearing a hat with a visor, the visor shadow should fall naturally across the face. Many photographers think the shadow cast by the visor should not shade the eyes. The shadow from the visor should shade the eyes. However, in a portrait, this shadow should not be so dark that shadow detail is lost and the eyes are hard to see. To prevent this shadow from being too dark, raise the main light to the desired height, and instead of aiming it down at an angle, aim it straight. This way the light is cast under the visor and prevents the shadow from becoming too dark.

MAIN LIGHT DIRECTION

By the time you have determined the main light distance and the height for a given subject, you should have a pretty fair idea of the direction of light from the main light. To establish the direction from which this light should come, move the main light in an arc, to the right or left, around the subject.

Remember, while moving the main light, its established distance and height should be maintained. The shadow cast by the subject's nose is your key to main light direction. The light should be moved around until the shadow cast by the nose merges with the cheek shadow and leaves a small, triangular highlight on the cheek. When this is done, the main light is in position. Remember, the main light must always be the dominant, directional, shadow pattern forming light.

FILL-IN LIGHT

Once the main light has been established, the fill or fill-in light is added. This fill light is a secondary light and must not overpower the main light. Its purpose is to fill in and soften the shadow areas, making them lighter, and to provide shadow detail. The fill light is placed slightly above the subject's eye level, on the opposite side of the camera from the main light and near the camera lens axis. The fill-in light should be less intense than the main light and of softer quality. This light is often diffused even when the main light is not. By placing the fill light slightly above the subject's eye level, you can cast a shadow under the chin. This shadow separates the head from the neck. The chin shadow should be soft and unpronounced.

The intensity of the fill-in light can be controlled by either adjusting the power setting of an electronic studio light set or adjusting the light-to-subject distance. The fill light can be moved in an arc to the side of the subject and away from the camera. The fill light must not produce conflicting shadows (shadows that point toward the main light).

CATCH LIGHT

A catch light provides a small, bright reflection of the main light in the eyes of the subject. It adds life and brilliance to a portrait and gives the eyes sparkle. There should be only one catch light in each eye, and it should be high in the iris of the eye. For broad lighting, the catch light should be approximately in the 11 o'clock position. The main light for short lighting should create a catch light at approximately the one o'clock position.

The lighting ratio for portraits should usually be about 3:1; 4:1 is maximum for good color portraits.

BACKGROUND LIGHT

The third light in studio portrait lighting is the background light, see figure 2-13. A background light is usually placed on a low stand midway between the background and the subject. When adjusted correctly, the background light provides good tonal separation between subject and background. The intensity of the light falling on the background should not normally be greater than the intensity of the light from the main light falling on the subject's face. By increasing or decreasing the intensity of the light on the background, you can control the tone or color reproduction of the background in the finished print. To reproduce the background color to its "true" color in a color print, it must receive the same amount of light as the subject's face.

When taking portraits for use on a roster board, you want the tone and color of the background to be consistent. When the backgrounds vary in color, the roster board does not appear uniform, and the attention of the viewer is distracted. When a background light is used, it is wise to position it before setting up any other light. It is easier to determine its effect without the interference of the main and fill light.

The background light should be positioned so the brightest area of the light illuminates the background directly behind the head and gradually falls off into the corners of the frame. When the background light is set in this manner, it separates the head from the body and draws the viewer's attention to the subject's face.

Figure 2-13, Effect of backlighting.

HAIR LIGHT

Once the main, fill and background lights are in their established locations, additional lights may be added to the setup to further enhance the portrait. One such light is a hair light. A hair light is usually a small lighting unit placed on a boom so it shines down from above and behind the subject. It is used to lighten the hair (or hat) and shoulders, add detail to the hair, and separate the subject from the background, presenting the illusion of a third dimension, see figure 2-14.

The intensity of the hair light varies with the subject since it is dictated not only by the color of the person's hair (or hat) but also by the amount of sheen the hair has. The hair light is usually placed on the side of the subject opposite the main light and behind the subject. It should be used from an angle about six to eight feet high and from a position close to the center of the subject area without

the light stand or boom showing in the picture. Light from this unit should not be allowed to spill over onto the forehead or tip of the nose. The hair light normally has a snoot attached so light from it does not strike the camera lens. Be sure the hair light is turned off when making any exposure readings. This light does not affect your basic film exposure, but it could influence your meter.

Figure 2-14, Effects of hair light.

SIDELIGHTING

With sidelighting, the face is lit more intensely on one side than the other (see figure 2-15). This type of lighting is well suited for young women WHO have smooth skin and regular facial features, or for men whose rugged character lines should be emphasized. Normally, you will not use sidelighting for official portraits.

Figure 2-15, Sidelighting.

BUTTERFLY LIGHTING

Butterfly lighting is often used when making portraits of women. To start, you can place the main light very close to the camera lens axis at about the subject's eye level. This creates a flat lighting, and facial feature characteristics can be lost. By moving the main light higher, you can create a certain amount of modeling. The light now creates a little modeling and is still very flattering and almost foolproof. This lighting is flattering because it does not emphasize lines or crow's feet around the eyes, wrinkles on the forehead, or shadows around the mouth. It does, however, emphasize eyes and eyelashes, especially in females. The main light should be just high enough to cast a shadow of the nose about a third of the distance from the nose to the top edge of the upper lip (see figure 2-16).

Figure 2-16, Butterfly lighting.

RIM LIGHTING

Rim lighting is often used when making profile portraits. Rim lighting is the same as backlighting, where the subject is lighted from behind causing the facial features of the profile to be highlighted (see figure 2-17).

In a profile portrait, when a person looks straight ahead, only the whites of the eyes are seen by the camera. This causes an undesirable effect. Instead have the eyes cheat. Turn the eyes slightly toward the camera, without turning the head, to show enough of the iris so the eye can be seen as an eye, not a white ball. Have the subject's head tipped back slightly. This separates the chin from the far shoulder, gives a better neckline, and reduces the appearance of a double chin. Allow more space on the side of the picture toward which the eyes are looking. This allows the subject to "look" beyond the frame.

Figure 2-17, Rim lighting.

PORTRAIT STUDIO EQUIPMENT

Barn Doors – Barn doors are made from opaque material. They are usually made of metal, painted black, and attached and hinged to the front of a light unit. They can be positioned to block or feather a portion of the light produced by the unit. Barn doors are made for both spotlights and floodlights. They are good accessories for controlling spill light.

Snoots – Snoots are cylinders, open at both ends, usually made of metal and painted black. They are used at the front of a spotlight to limit the size of the circular area projected by the unit. Short, wide snoots give a large circle of light. Long, narrow snoots give a narrow circle of light. A cardboard tube or black-rolled paper can be used for a snoot when you need to improvise.

Umbrellas – Umbrellas work much like the reflectors used on floodlights and provide an excellent means of converting specular light into soft, diffused light. Umbrellas can be used with any light source. The light unit points away from the subject; the umbrella is attached in front of the light and reflects or bounces the light back and onto the subject. The reflected light falling on the subject is softer and more diffused than the light originally emitted by the source. The reflecting surface of the umbrella determines the quality of the light. Umbrellas are usually made with a matte, white surface that provides a very soft, completely diffused light. Some umbrellas are constructed with a shiny, metalized surface. Metalized umbrellas throw a somewhat specular light, but the light is softer and spread over a larger area than the light emitted by the original light source.

Screens – Screens can be used to help eliminate strong shadows on a subject.

CORRECTIVE TECHNIQUES

Because the photogenic qualities of each person's face vary, certain corrective techniques in posing, lighting, and camera heights can be used to help depict the subject favorably and improve the quality of the portrait. Changing the camera viewpoint, combined with proper lighting and pose, can create amazing alterations in the pictured appearance of any face. Keep in mind that the most commonly made mistake is placing the subject too low in the frame.

For example, when the subject has a long nose, the light should be low to shorten the shadow. When the subject has a short nose, raise the main light to lengthen the shadow. This has a secondary effect as well. It adds form below the eyebrow and accentuates any slight hollowness in the cheeks, giving a more provocative look.

When shooting a portrait of a person smiling, you must shorten the nose shadow because the upper lip draws up and the shadow goes over the lip. The nose shadow should not extend over or touch the edge of the lip. When it does, the lip form is destroyed and it appears unnaturally small. The main light-to-subject distance is again determined using the forehead highlight test. The fill-in light is positioned directly below the main light-close to the camera lens axis and slightly above the subject's eye level. The intensity of this light should be about one f/stop less than the main light. The lighting ratio is established by moving the fill light closer to or farther away from the subject to increase or decrease its effect. Balance also can be controlled by using diffusion screens over the fill-in light. Although not as flexible as three-quarter lighting, front lighting does have some flexibility. The subject's head can be posed from full face to profile. However, the nose shadow must always remain under the nose. Therefore, the main light must be moved with the head; and as the head moves to the three-quarter or profile position, the hair light also must be moved. The fill light is not moved.

In the chart below, you will find additional techniques.

Issue	Corrective Technique
Chubby, round face	<ul style="list-style-type: none"> • Shoot three-quarter view, light side of face away from camera • Use three-quarter or sidelighting
Thin face	<ul style="list-style-type: none"> • Shoot front, full face • Use low three-quarter or sidelighting
Wide forehead	<ul style="list-style-type: none"> • Use low-camera viewpoint • Tilt chin upward
Narrow forehead	Use high-camera viewpoint
Baldness	<ul style="list-style-type: none"> • Use low-camera viewpoint • Little or no hair light • Blend head with background
Eyes close together	Shoot three-quarter pose
Eyes far apart	Shoot three-quarter pose
Small eyes	<ul style="list-style-type: none"> • Shoot three-quarter pose • Use three-quarter lighting so the eyes are in shadow
Large or protruding eyes	<ul style="list-style-type: none"> • Use high three-quarter lighting • Lower eyes slightly
Deep set eyes	<ul style="list-style-type: none"> • Use Low-camera viewpoint • Use frontlighting to keep eyes out of shadow
Uneven eyes	Turn head toward one side so natural perspective eliminates uneven appearance
Bags under eyes	<ul style="list-style-type: none"> • Use makeup • Use frontlighting
Cross eyed or defective eye	<ul style="list-style-type: none"> • Turn head so bad eye is away from camera • Light side of face toward camera to place other eye in shadow
Short nose	<ul style="list-style-type: none"> • Use front lighting • Use high-camera viewpoint
Dark skin	<ul style="list-style-type: none"> • Look for backgrounds slightly darker than the subject • Keep as much light as possible off the background • Move the subject away from the bright background • Keep subject away from a wall, desk, etc., to avoid shadows.

PORTRAIT COMPOSITION and SUBJECT PLACEMENT

As in every type of photography, in portraiture there must be one, and only one, principal point of interest. Naturally, in a portrait, this is the subject's face. You can emphasize the point of interest in a portrait by doing the following:

- Contrasting the point of interest with the background
- Giving it the strongest lighting
- Posing the subject and arranging the props, so all elements point to the point of interest
- Identifying it at a strong point within the picture area.

Where are the strong points within a portrait picture space? The principle of thirds, to be discussed in a subsequent chapter, applies to portraiture as well. These are the areas within a portrait

that attract eye attention and are the preferred locations for the center of interest. In a portrait, when the main point of interest is located at Point A, the secondary point of interest should be at Point D. If B is the point of interest, C becomes the secondary interest point. Such an arrangement obviously balances the composition. Usually in portrait composition, the eyes fall close to Points A or B.

These positions are approximations only. The final adjustment of the head depends upon:

- the eye direction
- the shape of the body
- the leading lines

No rule can be given for best portrait composition. Rules only give guidance to a rough approximation of good placement. You can only arrive at the best composition for each portrait through the feeling for balance and subject position. When the head and shoulders are placed high in the picture frame, a sense of dignity and stability is gained. Such placement is particularly appropriate when the subject is a person of importance, such as your commanding officer. However, when the head is too high, viewing the picture is uncomfortable. This creates a scenario in your mind that if the subject stood up he would bump his head. Also, when the head is too high, the proportion between head and body areas becomes awkward.

FULL-LENGTH PHOTOGRAPHS

Another type of portrait photography you will encounter as a Navy MC is full-length photographs used for promotion and other selection boards. Per the [Military Personnel Manual](#) article 1070-180 (officer photographs), "photographs are required for all officers of the Navy and the Navy Reserve, regardless of status, within three months after acceptance of each promotion." This article also provides information for you as the MC when you are shooting this type of portrait. For example, the article states that the photograph must be in color with the subject at a three-quarter view, left shoulder forward. It also spells out the required photo size and specifications for the embedded title board.

When shooting full-length photos for boards other than officer promotions, ensure you review the current instruction for such additional guidance.

Background – Since the studio setup is unique for full-length photographs, they should be scheduled at a time other than that of normal head-and-shoulders portraits. The background for full-length photographs must be a contrasting color from the uniform of the subject. Normally, white seamless paper is used because it provides the best results. When white seamless paper is used for full-length portraits, it must drape down and provide enough coverage for the subject's head and extend to the deck so the subject is standing on it. You should protect the background from footprints and tears by laying down a protective material, such as paper or acetate.

Lighting – When lighting a full-length portrait, you must light the entire body of the subject evenly and not allow objectionable shadows to show on the final product. This is best achieved when the subject is lighted with light diffused from two umbrellas. The background can be lighted evenly with two background lights you should always conduct tests to determine the best lighting setup for your studio equipment and facilities.

PASSPORT PHOTOGRAPHS

Passport photographs are special portraits required for travel outside the United States. If you are tasked with shooting passport photographs, you should familiarize yourself with the current U.S. government passport photo requirements.

Passports should only be provided to U.S. military personnel, their authorized family members, and employees of the federal government when required for executing official orders. Providing such photography for purposes and to individuals other than this is an infringement of the rights and commercial enterprise and may violate U.S. Navy Regulations.

Passport photos must portray a good likeness of the applicant as well as satisfactorily identify the applicant. Passport photographs must meet the following requirements:

- Photographs must be 2x2 inches in overall size. The image size, measured from the bottom of the chin to the top of the head (including hair), shall be not less than 1 inch or more than 1 $\frac{3}{8}$ inches
- Passport photographs must be in color (see figure 2-18)
- Photographs that depict the applicant as relaxed and smiling are encouraged. Photographs should be portrait-type prints, meeting the size and image specifications listed above. Photographs must be clear, front view, full face, eyes open with a light, plain background
- A passport photograph serves to identify the passport applicant. When glasses, a hearing aid, a wig, or similar articles are normally worn, these articles should be worn when the photograph is made. Dark glasses with tinted lenses are not acceptable, unless required for medical reasons
- Photographs should be made in normal street attire without a hat or other headgear that obscures the hair or hairline.

Up-to-date guidelines for taking passport photos can be found on the U.S. State Department page for [professional photographers](#).

Figure 2-18, Passport dimensions.

TENTING

Photographing small products can be quite difficult if they include bright reflective surfaces. You can easily see other nearby objects reflected in them and sometimes even the whole studio. Also,

light from the lighting units may reflect off the surface very strongly at a particular point. This can create an unwanted bright highlight. There are two ways to get around these problems. You could use many lights and add reflectors to make sure the lighting is even. This may solve the problem of light from the lighting units reflecting off the subject surface, but unfortunately there are two great disadvantages: it requires more lights than most photo labs have, and you still have reflections. The other way to solve the problem is to use the tenting technique. The tent consists of a frame covered by a translucent white material that casts a diffused illumination on the subject. The lights are placed outside the tent and directed onto the translucent material. The color of the background, which is placed inside the tent with the subject, depends on the subject and the effect desired (see figure 2-19). Strips of black or colored paper taped to the inside of the tent add the necessary dark accents or "bring to life" a colorless object.

Figure 2-19, Tenting.

MULTIMEDIA

Just as MCs who shoot still and video images need to understand about lighting and color, so do those of us working with multimedia products. More specifically, you must understand the difference between RGB color and CMYK color in order to ensure the products you create look as good in print as they do projected on a screen.

COLOR MANAGEMENT

Few issues in multimedia cause as much confusion as color management and the differences between the RGB (red, green, blue) and CMYK [cyan, magenta, yellow, and key (black)] color models. These color models are opposites.

RGB, sometimes referred to as an additive color process, is what your monitor uses to send color to your eye. It combines red, green, and blue to create a whole range of different colors. CMYK is the color space used in the world of ink and paper. It is also known as a subtractive color process. Cyan, magenta and yellow inks are combined to create thousands of other colors. Black ink is added into the process, because while in theory, black can be created by combining cyan, magenta and yellow. In reality, the combination has somewhat of a tint and is not pure black. The result of this combination, in reality, is black with a tint, not pure black.

NOTE: White establishes overall color balance of your monitor.

So what does all this mean to you as an MC? For starters, RGB offers a wider range of colors than CMYK, and RGB colors tend to be more vivid than CMYK. Additionally, many RGB colors cannot be duplicated using the CMYK process.

As long as your product remains on a computer screen (website, command presentation, etc.) the differences between the two-color processes are purely theoretical. However, the moment your desktop published document makes the leap from monitor to printing press, the differences between the two color spaces become crucial. A green that looked vivid on screen can turn into a dull, khaki color when your document is printed. That charming piece of clip art of Santa's elves in bright green outfits suddenly looks like a picture of elves in Army uniforms when converted from RGB to CMYK.

Thus, if you are using a particular color, convert it to CMYK to make sure it will print the way you want it to. Note that some software does not allow users to work in CMYK.

In the early days of desktop publishing, the prevailing wisdom was that all documents should be converted to CMYK before sending them to a printer or service bureau. This allowed the desktop publisher a measure of control over color appearance. More than one desktop publisher has forgotten to convert a color, thus having a print job come back with graphic elements like lines and shaded boxes missing as a result.

Nowadays, however, some printers prefer to receive files in RGB, so they can convert to CMYK themselves using their expertise. This helps them convert the colors to their closest CMYK equivalents, while taking into account the calibration of their printing equipment. The key is to consult with your printer or service bureau ahead of time to see what format they prefer for your document.

If using your shop's inkjet printer or desktop color lasers, keep in mind that these devices sometimes convert files from RGB automatically. However, the limitations of CMYK still apply to these output devices, so design with color mode differences in mind. As with any equipment you use in your shop, always check the user's manuals and get to know your equipment.

SUMMARY

In this chapter, you learned about light, lighting techniques and color and how these processes and theories affect photography, videography and multimedia products. Lighting is critical to all visible mediums, and, as an MC, light is one of the most important tools you'll have in your toolbox. Today's MCs produce, edit and view products on light-sensitive devices that require a basic understanding of what this chapter has covered. Therefore, the discussion of color, theory of light, and multimedia in this chapter is meant to be a quick and efficient reference to the visible light portion of the electromagnetic spectrum. Remember having an understanding of how light and color affect your images and multimedia products is critical to your role as an MC.

CHAPTER 3

PHOTOGRAPHY

Learning Objectives: *Upon completing this chapter, you should be able to do the following:*

- *Identify the basic parts of a camera.*
 - *Identify the basic process of photography.*
 - *Identify camera accessories.*
 - *Identify the methods used for controlled and uncontrolled shooting.*
-

INTRODUCTION

Photography is one of the pillars of the MC rating, and every MC must possess the skills necessary to capture images in support of our mission. As you have heard hundreds, if not thousands of times in your lifetime, “a picture paints a thousand words.” Statistics show most people glance through newspapers and magazines, and rely on imagery to tell the story. Visual imagery readily tells and sells the Navy story to the media, elected officials and the public. Without imagery, we have no story.

In this chapter we will take what you learned about lighting and color and turn our focus to cameras, camera operations and basic shooting techniques.

CAMERA OPERATIONS

The basic elements of photography include:

- The Camera
- Aperture
- Shutter
- Exposure
- Depth
- Angle
- Lens
- Accessories
- Composition Techniques
- Controlled/Uncontrolled Subjects.

The CAMERA

Derived from the Latin phrase *camera obscura*, meaning dark chamber, a camera is a light-tight box used to capture images. A camera generally consists of an enclosed hollow chamber with an opening (aperture) at one end for light to enter and a recording or viewing surface for capturing the light at the other end. Though still based upon this principle, additions to the basic camera have improved focusing the image, viewing, controlling the amount and duration of light entering the box, as well as range and exposure calculations.

Today's MCs use digital single-lens reflex cameras, (DSLRs), that use a mechanical mirror system and a pentaprism that directs light from the camera's lens to its optical viewfinder found on the back of the camera. DSLRs resemble traditional 35mm format cameras.

CONTROLS AND INDICATORS

The basic DSLR camera (see figure 3-1) contains main controls and indicators, which will be discussed briefly below. However, when you begin working with a camera, you should take the time to read through the camera's manual and to familiarize yourself with your equipment. Imagery you produce will be a result of your skills and experience in using your camera. The camera is simply the tool with which you gather this imagery.

Figure 3-1, Digital Reflex Camera.

APERTURE

Aperture is the variable opening, produced by the iris-diaphragm, through which light passes into the camera. The aperture control is a ring around the lens with a scale that lists aperture numbers (2.8, 3.5, 4, 5.6, etc.), also known as "f/stops." The ring sets the f/stop on the lens to control the amount of light entering the lens.

Aperture also controls the depth of field of an image, or the range of acceptably sharp focus in front of and behind the subject of your image. The lower the f/stop, the shallower the depth of field.

On modern cameras, the aperture settings are controlled on the camera. Full stops are 1.0, 1.4, 2.0, 2.8, 4.0, 5.6, 8, 11, 16, 22, 32, 45, 64, 90 and so on. Notice that the number doubles for each two-stop decrease in size. Slight optical corrections are made for f/11 and f/45. This may seem confusing at first, but knowledge of the f/stop system is necessary to compute optical formulas used by advanced photographers. It is necessary to know that each marked f/stop on a lens, except its widest aperture, is usually a full stop — that is, it admits one-half or twice the amount of light as the adjacent stop, and the larger the number, the smaller the aperture. At first, it is perhaps easier to think of the f/stops in terms of fractions; 1/8 is larger than 1/11 which is, in turn, larger than 1/16.

Setting the Aperture Control

Adjust the f/stop on the aperture control ring on the lens, or the main control dial on the camera, depending on the specific type of camera and lens, to attain the correct exposure. Both controls can increase or decrease the depth of field.

SHUTTER

A shutter controls both the exact instant of exposure to light and the duration of that exposure. The shutter works in conjunction with the diaphragm to control the exposure. The shutter is a thin sheet that covers the charge-coupled device, or CCD (think of the CCD as film). When this shutter opens, it exposes light from the exterior onto the CCD, allowing a photo to be taken. The length of time that the shutter remains open is termed the shutter speed.

Shutter Release Button

The shutter release button opens the shutter and initiates the exposure.

Shutter Speed Dial

The shutter speed dial indicates optional shutter speeds and sets the length of time the shutter remains open during an exposure. Shutter speeds are indicated in fractions of a second; for example, 60 = 1/60 of a second (also expressed as 1/60). The higher the number on the dial, the faster the shutter speed and the shorter the exposure. Like aperture settings, shutter settings are controlled on the camera on modern cameras. Shutter speeds control the duration of time that light is allowed to pass through the lens aperture to the film. Shutter speeds are usually marked on the camera as the reciprocal of the fraction of a second that the shutter remains "open" (one is 1/1 or one second, two is 1/2 or one-half second, four is 1/4 or one-quarter second and so on).

Standard shutter speeds are B, 1", 1/2", 1/4", 1/8", 1/15", 1/30", 1/60", 1/125", 1/250", 1/500", 1/1000" and 1/2000". B is the bulb setting. Bulb setting allows the shutter actuation button to keep the shutter open for so long as the shutter release button is held.

SETTING THE SHUTTER SPEED

You may encounter situations where you need to freeze action or blur motion. In these situations you must manipulate both the shutter speed and the aperture control ring. For instance, you may set your camera at 1/60" to illustrate the speed of a runner — his legs and arms are a blur of motion on the finished photograph.

Consequently, if you want to freeze the action, you set your camera at 1/250" or higher. Then the runner's legs, arms and victory expression are "frozen." For hand-held shots, choose a shutter

speed no slower than the speed closest to the focal length of the lens. For example, you would select 1/60" for a 50mm lens and 1/250" for a 250mm lens.

To stop the movement or action in a picture, you must consider the following three factors:

- *Relative movement of the subject* — the faster the movement, the faster the shutter speed required. The term relative movement is used because if the motion of the subject is followed, that is, the action is "panned" with the camera, a slower shutter speed can be used than if the camera were held stationary
- *Subject's direction of movement* — a subject traveling at a right angle to the camera/lens axis requires a faster shutter speed than one traveling at a diagonal. Conversely, a subject moving toward or away from the camera, parallel to the lens axis, can be "stopped" with a slower shutter speed than movement in other directions
- *Camera-to-subject distance* — the closer the action is to the camera, the faster the shutter speed must be. A car traveling 60 miles per hour across the lens axis at a distance of 100 feet would be "stopped" by a shutter speed of 1/1000" (or perhaps 1/500"). However, if the camera-to-subject distance were increased to 500 feet, the action could be "stopped" with a shutter speed of "1/250" or "1/125." If the car was a half-mile away, 1/60" should be sufficient to stop the movement.

ISO Indicator

The ISO (International Standards Organization) is another method of controlling the amount of light that enters a DSLR. The lower the ISO setting, the less light available in the camera. Modern cameras can be set as low as 100 and as high as 6400.

EXPOSURE

Exposure is the amount of light falling on a unit area of the digital sensor. The intensity is the amount of light falling on this unit area during the exposure time. Thus the equation for exposure is as follows:

$$\text{Exposure} = \text{Intensity} \times \text{Time} (E = I \times T)$$

Exposure is controlled through the aperture setting, shutter speed and ISO speed. The same exposure can be given to a certain subject by using various combinations of lens openings and exposure times — a wide opening and short time of exposure may allow the same total amount of light to reach the sensor as a small opening and a long exposure time. A common rule for exposure calculation is the "sunny f/16" rule.

To use the f/16 rule, set your camera shutter speed to 1/125 and your aperture to f/16. In photography, the **sunny f/16 rule** (also known as the **f/16 rule**) is a method of estimating correct daylight exposures without a light meter and can aid in achieving correct exposure of difficult subjects. As the rule is based on incident light, rather than reflected light as with most camera light meters, the photographer compensates for very bright or very dark subjects. The rule serves as a mnemonic (or a reminder) for the camera settings obtained on a sunny day using the exposure value (EV) system.

Equivalent Exposures

Aperture and shutter speeds each have a doubling and halving effect on exposure. This doubling and halving relationship of aperture and shutter allows you to combine different f/stops and shutter speeds to alter the image, while, at the same time, admitting the same amount of exposure to the light-sensitive material.

For example, you have determined that the correct camera settings for your subject is 1/125 second, at f/16. Instead of using this combination of shutter speed and f/stop, you could double the shutter speed (to stop action) and halve the f/stop. In this example your new camera setting could be 1/250 second at f/11, 1/500 second at f/8, or 1/1000 second at f/5.6, and so on. Or when you need more depth of field, 1/60 second at f/22 or 1/30 second at f/32, and so on, can be used.

These shutter-speed and f/stop combinations are called equivalent exposures. Equivalent exposures control depth of field and stop motion. The combination of shutter speed and f/stop is used to capture the subject and effect you want to create.

Because many cameras are fully automatic, you may wonder why you need to know basic exposure. There are three good reasons for knowing an understanding the basic principles of exposure. First, you want to control the depth of field and stop action instead of the camera controlling it. Second, a light meter cannot think for itself. A light meter only responds to the light it receives. You must know when to override the camera, such as when the subject is sidelighted or backlighted. Lastly, meters are mechanical. They can be inconsistent, consistently wrong, or fail altogether. When you can workout in your head, roughly what the camera exposures should be, you will know when the camera or light meter is wrong. Knowing when a light meter is giving incorrect readings could make the difference between success and failure of an important photographic assignment.

DEPTH OF FIELD

You do not always want everything in your photographs to be in sharp focus. By using selective focus, you can emphasize the main subject and draw attention to it. "Selective focus" means the use of a shallow depth of field to isolate or emphasize the subject. Selective focus is the control of the zone of sharpness, or depth of field, in your photographs. "Depth of field" is the distance between the nearest and farthest points of acceptable sharp focus of the scene photographed.

Simply stated, depth of field increases as the focal length of the lens decreases (a shorter focal-length lens is used). As the lens aperture decreases (gets smaller in size) and as the distance focused on (focal point) increases, or both. Inversely, depth of field is less for long-focal-length lenses than for short-focal-length lenses, is less for wider apertures and is less for shorter lens-to-subject distances.

A peculiarity of the term depth of field is that it is typically used to define a condition of maximum depth of field. When the depth of field is shallow or purposely restrictive, the term selective focus is used. Selective focus is merely "selecting" a depth of field that will satisfy a requirement to have the foreground, background, or both, not in sharp focus. The use of selective focus to make the main subject stand out in the picture by being "sharp" while the rest of the image area is blurred is a good technique for gaining subject emphasis.

Camera Modes

Aperture Priority – User controls the aperture, and the camera chooses the appropriate shutter speed in order to capture correct exposure.

Shutter Priority – User controls the shutter, and the camera chooses the appropriate aperture setting in order to capture correct exposure.

Program Mode – The camera controls both shutter and aperture settings in order to capture correct exposure.

ANGLE OF FIELD

The focal length of a lens is a determining factor in the coverage of that lens. The maximum coverage at the focal plane of a lens is expressed in degrees as the angle of field. Angle of field is the widest angle at which light entering a lens produces a usable portion of the circle of illumination at the focal plane. Light around the edges of the entire circle falls off in intensity before disappearing completely. The usable portion of this circle is called the *circle of good definition*.

LENSES

As noted previously, most digital single-lens reflex cameras (digital SLR or DSLR) have interchangeable lenses. The "focal length" of a lens is the distance from the optical center of the lens to the focal plane (film plane) when the camera is focused upon an object at infinity. A 50mm focal-length lens is considered the "normal" lens, because when you look through the viewfinder, objects appear at their approximate normal size. A smaller than normal focal length (such as 28mm) means a wider angle of view. A longer than normal focal length (such as 135mm) is a telephoto lens.

The f/stop (aperture) ring controls the amount of light passing through the iris diaphragm of the lens and striking the CCD. The higher the f/stop number, the smaller the amount of light allowed to enter the camera lens. This principle works in the same manner as the iris of the human eye (see figure 3-2).

Figure 3-2, Comparison of the iris diaphragm of a camera lens to the iris of the human eye.

The types of lenses you may use in the fleet are as wide angle, ultra-wide angle, macro, normal focal length, telephoto, and variable focal-length, or zoom, lenses.

Wide-Angle Lenses – Anything less than 40mm in focal length is considered a wide-angle lens. A wide-angle (short focal length) lens is designed to take in a large view and is indispensable when working in confined spaces or when you want to cover a large area. Wide-angle lenses have their own qualities, causing apparent (REPEAT ... apparent) distortion and foreshortening of perspective, so objects close to the lens appear large, while background objects diminish in size dramatically.

Ultra-Wide-Angle Lenses – Many ultra-wide-angle, or short-focal-length, lenses are known as fisheye lenses. The ultra-wide-angle view of these lenses results in image distortion. Straight lines appear curved and curved lines may appear straight. Fisheye lenses make objects appear to diminish in size rapidly as the distance from the camera increases and objects close to the camera appear far apart.

Macro Lenses – A macro lens is used for close-up photography and is a valuable lens for any imaging facility to have. These lenses come in various focal lengths and are capable of producing up to one-half or even life-size 1:1 images.

Normal Focal-Length Lenses – The standard or normal focal-length lens for a DSLR camera is from about 40mm to 58mm (the most common being 50mm). This focal length gives you the same impression as you would get if you look at the subject with one eye. A normal lens helps you shoot photos of people when you don't want to get too close.

Telephoto Lenses – A lens with a focal length greater than 58mm is a long focal-length lens. Most modern, long focal-length lenses are called telephoto lenses because of their compact design. A telephoto lens is used from farther away to obtain the same size image that would be produced by a shorter lens at a closer distance. Any telephoto lens seems to compress the perspective of your image. A telephoto lens does not compress perspective; it only appears that way! Remember, perspective does not depend on the lens being used, but on the position of the camera.

Variable Focal-Length Lenses – A variable focal length, or zoom, lens changes the focal length by mechanically moving the elements within the lens. The movement of lens elements, in unison and in precise order, gives a smooth change of image size while maintaining acceptably sharp focus throughout the entire adjustment. The biggest advantage of a zoom lens is that you have many focal lengths in one single lens. You do not have to change lenses to use a different focal length.

NOTE: A lens used for portraits should have a longer than normal focal length. A long focal-length lens produces a large image on the film while keeping the camera at a far enough distance from the subject to prevent image distortion. Normal focal-length lenses are too short for anything but full-length portrait photography. They require the camera to be too close to the subject, image distortion becomes apparent, and working too close to the subject may intimidate him or her. Working too far from the subject with a normal lens to prevent distortion makes the image size too small. The ideal lens for portraiture should have a focal length equal to 1 1/2 or 2 times the diagonal of the film.

Optical Center

The optical center of a lens is a point usually (although not always) within the lens, at which rays of light from different sources are assumed to cross.

Astigmatism

Astigmatism is a lens aberration that causes an off-axis point to be imaged as a pair of lines at right angles to each other and in different focal planes. A lens having astigmatism is unable to image horizontal and vertical lines in the same plane with equal sharpness.

Focusing Systems

Accurate focusing and framing are essential to good images, and modern cameras have many devices to help you get good focusing and framing results. Because of the principles of depth of field,

simple cameras are manufactured without any way of adjusting focus. The lenses of these simple cameras are prefocused at the hyperfocal distance.

The hyperfocal distance for a lens is determined by the focal length and the aperture. That allows "point and shoot," ID, and passport cameras to produce photographs where everything from about one half of the hyperfocal distance through infinity are acceptably sharp. Focusing is accomplished by adjusting the distance from the lens to the film. It does not matter which of the two is actually moved, the lens or the film. With handheld cameras the lens is moved in and out. No matter what system you use to focus the camera, there must be a means for you to determine when the image is in focus. Most cameras have automatic focusing systems. Your camera's user manual is always your best point of reference. Refer to your camera's user's manual for further information.

ACCESSORIES

There are many accessories photographers use in their day-to-day work some are required or optional, but we will only mention a few to give you an idea of what they are:

- Filters
- Light Meter
- Tripod
- Monopod
- Shutter Release
- Flash
- Lens and body caps
- Lens hoods
- Memory card.

Filters

Filters are optical elements, such as glass, gelatin or plastic, dyed in a specific manner to absorb light of certain colors selectively, to emphasize or subdue certain objects and to improve the monochrome or natural reproduction of objects. The purpose of photographic filters is to alter the characteristics of light that reaches the light-sensitive emulsion. As light is transmitted through a filter, at least one of the following alterations occurs:

- The color of light is modified
- The amount of light is reduced
- The vibration direction of the light rays is limited.

With the advent of digital photography and sophisticated computer photo-editing software, the physical application of filters is almost non-existent. However, neutral-density (ND) and polarizing filters continue to be of importance when creating digital images.

Neutral Density Filters Haze Filters

Neutral density (ND) filters reduce the amount of light passing through a camera lens without changing the reproduction of colors in the scene. These filters are nonselective in their absorption of colors of light and therefore uniformly reduce the various colors of light in the spectrum. White light and colored light are transmitted through an ND filter with only the intensity of the light being affected.

This type of filter is useful in any setting where you want to use larger apertures and/or slow shutter speeds in bright conditions. When you desire to reduce the depth of field but maintain a given shutter speed, ND filters permit the use of a larger f/stop which in turn, reduces the depth of field. Neutral density filters are used extensively in motion-picture photography where depth of field is usually quite deep. ND filters are also used with mirror-type lenses where there is no aperture control.

Polarizing Filters

Polarizing filters change the way your camera sees and treats light. Their effect becomes apparent when you look at the blue sky through a polarizing filter while rotating it. As you rotate the filter, the sky appears to get darker, then lighter. Reasons for using polarizing filters:

- Reduction or elimination of unwanted reflections (glare) from nonmetallic surfaces, such as glass and water
- Exposure control, similar to ND filters
- Reducing the effects of haze
- Darkening the blue-sky image in both black and-white and color photography
- Increasing color saturation in a color photograph without altering the hues of image colors.

As discussed in Chapter 2, the term *polarize* refers to a property of light that cannot be seen – the direction in which light rays vibrate. Unpolarized light rays vibrate in all directions at right angles to the ray itself. A light ray is polarized when vibrations are in one direction only.

Any synthetic material that polarizes light may be called a polarizer, or polarizing device. A polarizing screen is a polarizer in sheet form.

Although there are many different polarizing filters, there are only two main types – one that fits over the camera lens and one for use over a light source. Since they do not affect color, polarizing filters and screens may be used for both black-and-white and color photography. A polarizing device used over the camera lens may have small posts (known as indicator handles) projecting from the rim for aligning the axis of the polarizing grid.

LIGHT METERS

A light meter measures light. As you read in the previous chapter, light is crucial to producing a quality image. The correct use of a light meter greatly increases the accuracy in determining your camera exposure. You should also understand that the incorrect use of a light meter can result in consistently unacceptable results. To assure consistently acceptable exposures, you must become thoroughly proficient with the correct operation of a light meter.

A light meter can be either built into the camera or a separate handheld unit. Both types are sensitive instruments and should be handled with care. There is little maintenance, but they do

require batteries. When you think a light meter is not working properly, have it checked by a qualified technician. Always be sure to check your equipment before leaving on an assignment. Like all camera equipment, careless handling and excessive heat and moisture limit the life of a light meter. A light meter must not be subjected to high temperatures for prolonged periods of time. Unless the light meter is designed for underwater photography, it should be protected in inclement weather.

Light Meter Readings – There are two methods of measuring light with handheld light meters. These two methods are the incident-light method and the reflected-light method.

- *Incident-Light Method* – This method requires the use of an incident-light meter. An incident-light meter has a diffusing dome that covers the photoelectric cell. When an incident-light meter reading is taken, the meter is held at the position of the subject with the photoelectric cell pointed toward the camera. The meter measures the light falling upon the scene. The incident-light method of measuring light is used extensively in motion-media photography and gives fast accurate results in all photography. Most light meters are designed for use as either incident-light or reflected-light meters. By removing the diffusion dome from the photoelectric cell, you can use the meter to measure reflected light
- *Reflected-Light Method* – When you are taking this type of light-meter reading, the diffusing dome should be removed from the photoelectric cell and the meter pointed toward the subject. A reflected-light meter receives and measures the light reflected from a scene within the angle of acceptance of the meter. The term angle of acceptance compares to the term angle of view of a lens. Both are predetermined during manufacturing
- The angle of acceptance and the distance between the meter and the scene are the controlling factors as to how much of the reflected light from the scene is measured by the meter
- When the angle of acceptance is greater than the angle of view of a lens (when using a telephoto lens for example), the meter should be moved closer to the scene. Light meters that are built into the camera are reflected-light meters
- When these meters are used, the angle of acceptance is not greater than the angle of view of the lens being used. The meter measures the light from the scene as seen by the lens. Some reflected-light meters have angles of acceptance between 1 and 4 degrees
- These meters can be used from a distance to measure the reflected light from specific objects within a scene. Exposure meters with angles of reflectance this small are called spot meters.

Light Meter Operation – You must understand the way light meters operate to determine whether the information they provide is accurate. No matter what type of light meter you use, it is an electrical-mechanical device that can only provide information for which it is designed. You are responsible for translating this information into useful exposure data.

Light meters are calibrated to see one shade only – middle gray. This means the information that the meter provides, no matter how much light is falling on the subject or what the reflection characteristics are, reads the subject the same as though it were middle or neutral gray (18-percent gray). Theoretically, if you take a reflected-exposure meter reading from an 18-percent gray card and expose your film according to the reading, the result should be a picture that matches the tone of the gray card exactly. However, when you take a light meter reading of a white or black object, the light meter still reads the objects as though they were 18-percent gray.

When you take a photograph that includes gray, white and black cards, you will see how, depending on where you take the light meter readings, they affect your photograph. For example, when you take the light meter reading from the black card, the final picture reproduces the black as middle gray, and the gray and white cards as white. When you take the reflected-light meter reading from the white card, just the opposite occurs. In your final photograph, the white card reproduces as middle gray, and the gray and black cards reproduce as black. This example demonstrates overexposure and underexposure. When the reading was taken from the black card, the meter raised the black tone to middle gray, and the gray card tone was also raised so it reproduced as white. Thus both the black and gray cards were overexposed. The opposite occurred when the exposure was based on the reading from the white card. The white tone was lowered to middle gray and the gray card tone to black, resulting from underexposure. Only a light meter reading taken from the gray card allows all three cards to be imaged at their true tone.

A more practical example on the way a light meter reads 18-percent gray is illustrated in the following example. Suppose you are going to photograph a ship alongside a pier. Bright sunlight is striking the ship from the side, causing part of the ship to be in shadow. This creates a brightness difference between the highlight area and the shadow area. Both highlight and shadow areas are equal in size and importance. When you get close to the ship and take a reflected meter reading of the highlight area alone, you expect the finished photograph, like the white card in the above example, to be middle gray. When you stop down the aperture to the recommended exposure of the meter, you are also reducing the amount of exposure from the shadow area. This results in a loss of detail in the shadow area of the ship, because it is underexposed. The opposite effect occurs when you take a meter reading from the shadow area. In this case, the shadow tones are raised to middle gray and have detail, but the highlights are overexposed and completely "washed out." If, however, there was an area in this scene whose tone was midway between the highlight and shadow areas, you could use it to take your light meter reading (like the gray card was used in the previous example).

In this example, assume there is no tone midway between the two extremes. You can still get an accurate light meter reading of the entire ship. Since the highlight and shadow areas are of equal size, the average light meter reading you get will represent a tone that is midway between the two extremes.

Reflected-Light Meter Reading

- Variations – There are variations of light meter readings used to provide accurate light meter readings of different types of scenes. These methods are as follows: the integrated, or average, method, the brightness range method, the darkest object method, the brightest object method, the substitution method, and the bracketing method
- Integrated, or average, method – The technique of making reflected-light meter readings from the camera position is called the integrated, or average, method. This method was used and explained in the examples above. This method is accurate for the majority of photographs taken
- The integrated, or average, method of measuring reflected light is acceptable for scenes that consist of approximately equal portions of light and dark areas; however, when a scene is composed of either predominately light or dark areas, the meter reading may not be accurate. The reason for these inaccurate meter readings can be more easily understood by using an example of photographing a checkerboard with alternating black-and-white squares

- When the meter is held at a distance to include the entire board, the reflected light from both the black and the white squares influence the meter, so an average reading results. The light measured from this position is the integrated sum of both the white and the black squares, as though the checkerboard were one gray tone. The light meter reading from this point should produce an acceptable image. If you hold the meter so close to one of the white squares that the black squares have no effect on the meter reading, the reading is higher than the integrated reading and the meter indicates that the scene requires less exposure. The same principle applies when a reading is taken close to a black square. The reading indicates that the scene requires more exposure. Each of the meter readings is a measurement of 18-percent gray. You can apply this checkerboard example when you photograph scenes that are predominately light or dark
- Compensation is required to expose such scenes correctly. As a general guide, you should double the indicated exposure when the light measurement is taken from a predominately light scene and detail is desired in the shadows. When you take a light meter reading from a predominately dark scene and detail is desired in the highlight areas, you should reduce the exposure by one half.

Brightness Range Method – This method requires you to take two readings from the scene – one from the highlight area and another from the shadow area. You then base your exposure on a point midway between the two readings. The brightness range method of determining exposures for most scenes usually provides detail in both the highlight and the shadow areas.

An exception to this is when the exposure latitude is not capable of recording the brightness range of the scene. This can occur with scenes that have extremely great brightness ranges. A scene brightness range is the difference between the brightest and the darkest areas of a scene and is usually expressed as a ratio. The average brightness range of a normal scene is 160:1.

When the scene exceeds a brightness range of 160:1, you must compromise the exposure. This compromise can be as follows:

- Underexpose and sacrifice shadow detail to retain highlight detail
- Overexpose and sacrifice highlight detail to retain shadow detail
- Do not compensate and expose for the midtones and sacrifice both highlight detail and shadow detail.

Darkest Object Method – The darkest object method of determining exposures is actually a variation of the brightness range method. When you desire detail in the shadow area or darkest object within the scene, you take the light meter reading from this area. This method actually overexposes the image overall, causing the highlight areas of the scene to be greatly overexposed. This overexposure occurs because the light meter averages the light reflected from the shadow area and indicates an exposure to produce middle gray. When a great amount of detail is not needed in the shadow area and you want to expose the overall scene normally, you can take your light meter reading from the darkest object or shadow area and stop down two f/stops. This method provides a good overall exposure of the shadows, midtones, and highlights.

Brightest Object Method – Another variation of the brightness range method is the brightest object method. The brightest object method of calculating exposures is used when a highlight area within a scene is the only area within the scene from which you can take a light meter reading. This method works when you want to record detail in the highlight area. In both situations, you take only one light meter reading of an important highlight area. When you do not want the highlight to record

as a middle-gray tone and desire a good overall exposure of the scene, you simply open up two or three f/stops from the indicated exposure. When you need maximum detail in the highlight area, you can use the reading that the light meter provides. This records the highlight area as medium gray. This method underexposes the film in other areas of the scene that reflect less light.

Substitution Method – With the substitution method, you replace an object within the scene with an object, such as a gray card. You then take a reflected-light meter reading from this object. You use this method when the other methods of determining exposure are not possible. Such situations may be caused by excessive distance between the light meter and the scene, barriers in front of the scene, or the size of the scene makes it impossible to get an accurate light meter reading.

The substitution method is often used in studio situations where objects may be too small to obtain an accurate light meter reading. You should select substitution objects that match the light reflectance quality of the object in the scene. For example, a white card can be used to substitute highlight areas of a distant scene. A dark or a black card can be used to substitute a shadow area, an 18-percent gray card can be used to represent middle gray or the back or palm of your hand can be used to substitute a gray tone.

When the substitution method is used, take the light meter reading from the substituted item under similar lighting conditions that exist in the scene. When the scene is in bright sunlight, the substituted object must also be in bright sunlight. Likewise, a scene in shade requires a substitute light meter reading in shade. You can use each of the methods discussed previously with the substitution method. An 18-percent gray card can be used for the integrated or averaging methods, a dark and a light card can be used for the scene brightness range method, a dark card for the darkest object method, and a light card for the brightest object method.

Bracketing Method – There are times when unusual lighting or subject brightness prevents you from getting an accurate light meter reading. In these cases, a good insurance policy is to bracket your exposure. To bracket, you should take one picture at the exposure indicated by the light meter, and then take two more exposures: one at one f/stop under the indicated exposure and another at one f/stop over the indicated exposure. When you are in doubt about the correct exposure, it is always better to overexpose than underexpose. Even though overexposure produces excess densities in the negative, it still provides a useable image that can normally be corrected in the printing stage. When underexposed, if the image does not exist on the film, no corrective printing techniques can provide image detail.

Causes of False Readings

Light meters give erroneous or bad readings that produce underexposed images for a number of reasons. You can prevent these bad readings by being aware of the conditions that cause them.

Light Entering the Viewfinder – When taking light meter readings, you must be sure the reflected light that influences your light meter is actually from the object you want to photograph. Stray light, backlighting, large dark areas and shadows can all cause erroneous light meter readings. When using a light meter, be sure that shadows are not cast from the light meter, camera or yourself.

When a handheld light meter is used, the distance of the light meter to the subject should not exceed the shortest dimension of the object. For example, when taking a light meter reading of a person's face that is approximately 9x6 inches, you should hold your light meter about six inches from the face of your subject when taking the meter reading. When using a light meter that is built into a camera, be sure to focus on the image before taking a light meter reading.

Light entering the viewfinder and falling on the viewing screen can cause underexposure. Most TTL meters read the light falling on the viewing screen from the lens. When strong lighting is coming from behind the camera, it can influence the light meter. When an occasional underexposed frame in an otherwise successful series occurs, the cause may be light entering the SLR viewfinder. Make a point of shielding the viewfinder if you do not have a rubber eyecup. When you use a tripod, have the camera set on automatic and cap the viewfinder to prevent exposure errors.

Incorrect Film-Speed Setting – When the majority of frames are consistently underexposed or overexposed, the most likely cause is you have the wrong ISO set on the film speed dial.

Bright Subject – A bright object or highlighted area can affect the sensing area of a spot or center-weighted TTL meter. This results in an underexposed image. To prevent this from occurring, you should ensure the sensor is pointed directly at a midtone within the scene, and use this as the camera exposure. When you frame and compose your image, the light meter may indicate a different setting. Be sure to leave your camera set at the indicated midtone setting. Normally, light meters that take integrated or averaged readings of the field of view cannot be fooled in this instance. But remember, even integrated systems cannot cope with extremely bright areas that take up a significant portion of the frame.

Bright Background, Dark Subject – When you are taking photographs that are backlit or against a light background, there is always the danger of underexposing the main subject (unless you use special techniques to fill in shadows, such as using a reflector or a flash unit). Be careful to take a reading from only the shadow side of the subject in these situations.

Too Little Light – The most frequent cause of underexposure is trying to take pictures when there is not enough light. Light meter readings are not very accurate at these low-light levels. When you want to make photographs under these conditions, be sure to use a tripod and bracket to provide more exposure than indicated by the light meter. You also can switch to a higher ISO.

There are several other causes that may cause your images to be exposed incorrectly. Some of the most common causes:

- Wrong camera settings are set when transferring information from a handheld light meter to the camera. This can also occur when you attempt to override an automatic camera
- Using a camera with TTL metering and placing a color filter with a high-filter factor over the lens
- Wrong aperture setting when flash is used
- Shutter speed is not synchronized with camera flash
- Aperture or shutter speed setting is knocked while carrying the camera. Always check the camera setting before taking a photograph
- Weak or incorrect battery in the light meter.

TRIPODS

The best way to support your camera is with a sturdy, rigid tripod (see figure 3-3). Tripods are three-legged camera supports with flat platforms or heads in which cameras are secured. Most tripods are equipped with a head that has an elevator center post. The camera is attached to this center post and is raised or lowered easily by cranking the post up or down. These elevators eliminate

the need for readjusting all three tripod legs for making small, last-minute adjustments to the camera height.

Tripods come in a variety of designs, sizes and weights. The heavier models are the sturdiest and provide the best support; however, if too heavy, they are not very portable. As a rule, the heavier your camera, the heavier and stronger your tripod must be. For some of the light, full-size tripods, hanging a bag of sand or another weight from the tripod head improves rigidity. This is especially useful in high winds. Another method is to hang a strap from the tripod head, and use the strap as a foothold on which to apply downward pressure.

Tabletop tripods are also available and can be used almost anywhere a flat surface is available. These small tabletop tripods can be braced against the photographer's chest. Because of their small size, they fit in a camera bag. To set up a tripod, extend one leg straight ahead toward the subject. This way the camera may be aimed by pivoting the tripod on this one leg. Extend the other two legs and adjust them to level the tripod platform horizontally.

When setting up a tripod on level ground, you can waste a lot of time trying to get the tripod level if the leg sections are not extended fully. An easy solution to the problem is to mark the tripod legs in specific increments with a marking pen, pencil, or scribe. One method is to mark short lines at one-inch intervals and long lines at six-inch intervals. Doing this reduces your frustration, saves time, and allows you to level your camera on the tripod with less effort. When a tripod is set up on an uneven surface, several adjustments of the side legs are normally necessary. Readjustment of the front leg levels the camera vertically so the platform or head is level. Most newer tripods have platforms that can be adjusted by eliminating the need for minor leg adjustments.

To mount the camera on the tripod head, you secure it in place by tightening the tripod screw into the camera tripod socket. Secure the camera by tightening the camera clamp screw locknut. After the camera is mounted on a tripod, test the camera to ensure all camera controls are accessible and function properly. The camera should be stable and not shake when the camera controls are operated.

Using a foot strap to make a tripod more rigid

Using a monopod

Figure 3-3, Tripod and Monopod use.

Monopods

A monopod is a single pole on which a camera is mounted (see figure 3-3). Monopods are useful for keeping the camera steady for location work when a tripod is too bulky or difficult to use; however, the use of a monopod is not advisable when using large, heavy cameras or when shutter speeds below about 1/15 second are used. Standing or kneeling with a monopod braced against your body or leg provides a camera the extra support and steadiness required for it to be an effective tool.

Shutter Release

A shutter release is a device consisting of stiff wire encased in an outer flexible covering, or a wireless device used to trip a camera shutter without touching the camera itself.

Flash

The electronic flash is a high-voltage light source for illuminating the scene to be photographed. It produces a momentary flash of high-intensity light. See chapter 2 for more information on flash use.

Lens and Body Caps

Lens and body caps are protective covers that keep dust and moisture away from lenses and camera openings.

Lens Hoods

Lens hoods, or shades, are used to keep strong sunlight from striking the front of the lens obliquely.

Memory Card

Memory cards, also known as flash cards, are electronic data storage device that stores digital contents. They capacities depend on the gigabytes or megabytes. Always make sure you have extras!

PHOTOGRAPHIC COMPOSITION

Photographic composition is *the pleasing arrangement of subject-matter elements within the picture area*. The camera sees and records only a small isolated part of the larger scene, reduces it to only two dimensions, frames it and freezes it. It does not discriminate as we do. When we look at a scene we selectively see only the important elements and more or less ignore the rest. A camera, on the other hand, sees all the details within the field of view. This is the reason some of our pictures are often disappointing. Backgrounds may be cluttered with objects we do not remember, our subjects are smaller in the frame or less striking than we recall or the entire scene may lack significance and life. Good photographs are seldom created by chance.

To make the most of any subject, you must understand the basic principles of composition. How are photographic composition skills developed? You look, you study, and you practice. There are no hard-and-fast rules to follow that ensure good composition in every photograph. However, principles and elements provide a means of achieving pleasing composition when applied properly.

NOTE: After reading through the various photographic compositions, check out the [Navy.mil photo galleries](http://Navy.mil/photo_galleries) and see if you can identify the many techniques used.

Center of Interest

Each picture should have only one principal idea, topic or *center of interest* to which the viewer's eyes are attracted. Subordinate elements within the picture must support and focus attention on the principal feature so it alone is emphasized. The center of interest may be a single object or numerous ones arranged so attention is directed to one definite area. A photographer usually has at his or her disposal many factors or elements that can be used and arranged within the picture area to draw or direct attention to the primary idea of the picture. Some of these elements are lines, shapes, human figures, tone, and texture. Human figures attract attention more strongly than almost any other subject matter and unless they are the main object of the photograph should probably be kept out of the picture.

Subject Placement

In photographic composition, two general rules are used to determine the best location for the center of interest – *the rule of thirds* (see figure 3-4) and *dynamic symmetry*. In the rule of thirds, the intersection of lines that divide the picture area into thirds are good locations for the center of interest in most photographs. Notice we said **THE** center of interest. Remember, have only one center of interest to a image. The principle of dynamic symmetry is a similar idea. A good location for the center of interest is found by drawing or imagining a diagonal line from one corner to an opposite corner. Then, draw a second line perpendicular to the first from a third corner. The intersections of the lines are the location for the center of interest.

Figure 3-4, Rule of Thirds.

Simplicity

Simplicity is the key. The simpler and more direct a photo is, the clearer and stronger the resulting statement. When work toward simplicity, select a subject that lends itself to a simple arrangement or select different viewpoints or camera angles. Only after considering all possibilities should you take the photograph. Bottom line is to tell the story, while ensuring you have just the right amount of information to convey one single idea.

VIEWPOINT and CAMERA ANGLE

The proper viewpoint or camera angle is an important factor in good composition. Repositioning your subject within the viewfinder frame and changing the camera viewpoint or camera angle are two simple ways of controlling composition. The terms *viewpoint* and *camera angle* are often used in conjunction with one another and sometimes used interchangeably. They can also have

different meanings depending on how they are applied. Viewpoint is the camera position in relationship to the subject.

Low Viewpoint/ Low Camera Angle

A low camera angle is achieved when the camera angle is located below the point of primary interest and pointed upward. Low angles tend to lend strength and dominance to a subject and dramatize the subject. Low-angle shots are used when dramatic impact is desired. This type of shot is very useful for separating the subject from the background, for eliminating unwanted foreground and background, and for creating the illusion of greater size and speed.

High Viewpoint/High Camera Angle

High viewpoints and high camera angles help orient the viewer, because they show relationships among all elements within the picture area and produce a psychological effect by minimizing the apparent strength or size of the subject.

BALANCE

Balance in photographic composition is a process of making pictures appear harmonious. The subject placement within the picture area is the factor that must be carefully considered. Composition is kept in balance by two different methods:

Symmetrical (Formal) Balance

Symmetrical (formal) balance in a photograph is achieved when elements on both sides of the picture are of equal weight. The idea of formal balance can be related to a seesaw. When there are two equally weighted objects on the seesaw and they are equidistant from the pivot point, or fulcrum, the board will be in balance.

Asymmetrical (Informal) Balance

Asymmetrical (informal) balance is usually much more interesting than symmetrical balance. In asymmetrical balance the imaginary central pivot point is still presumed to be present. However, instead of mirror images on each side of the picture area, the subject elements are notably different in size, shape, weight, tone and placement. Asymmetrical balance is introduced when the presumed weight of two or more lighter objects is equalized by a single heavier object placed on the other side of the imaginary pivot.

Other Aspects of Balance

- An object far from the center of the picture seems to have more weight than one near the center
- Objects in the upperpart of a picture seem heavier than objects of the same size in the lower part of a picture
- Isolation seems to increase the weight of an object
- Intensely interesting objects seem to have more compositional weight
- Regular shapes seem to have more weight than irregular shapes

- Elements on the right side of an asymmetrical picture appear to have more weight than elements of the same size on the left side of the picture
- The directions in which figures, lines, and shapes appear to be moving within the picture area are important to balance. For example, a person may be walking in a direction, or his eyes may be looking in a direction, or the shape of some element creates a feeling of movement. When the feeling of direction is present within a scene, it tends to upset the balance if judged on the size of the subject alone.

SHAPES and LINES

Shapes and lines are important elements in photographic composition. When properly used, shapes and lines can create a desired effect.

Shape

Shape is a two-dimensional element basic to photo composition and is usually the first means by which a viewer identifies an object within the picture. *Form* is the three-dimensional equivalent of shape. The greatest emphasis of shape is achieved when the shape is silhouetted, thus eliminating other qualities of the shape, such as texture and roundness, or the illusion of the third dimension.

Lines

Lines unify composition by directing the viewer's eyes and attention to the main point of the picture or lead the eyes from one part of the picture to another. Lines that lead the eye or direct attention are referred to as *leading lines*. Vertical, diagonal, horizontal, and curved lines create different moods. Vertical lines communicate a sense of strength, rigidity, power, and solidarity to the viewer. Horizontal lines represent peace, tranquility and quietness. Diagonal lines represent movement, action and speed. Curved lines present a sense of grace, smoothness and dignity to a photograph. The most common curved line is the "S" curve.

Pattern

Creating images around repeating elements or patterns provides picture unity and structure. Pattern repetition creates rhythm that the eyes enjoy following repeated lines, tone, and color can also provide unity to your composition and combinations of these create interesting pictures. Triangles, squares, and circles are the basic shapes to look for in a pattern. Triangles and squares are usually static but can be placed to create a tension-filled, dynamic effect. Circles and curves are pleasing pattern shapes.

Volume

When photographing most subjects, you face the problem of how to symbolize three-dimensional objects in a two-dimensional picture. The solution becomes simple when a distinction is made between the two different ways three-dimensional objects appear: as positive or occupied space (volume) or as negative or unoccupied space. Positive space is where shapes and forms exist; negative space is the empty space around shapes and forms. An area of a photo absent of shapes and forms is negative space. It serves to balance the area. Areas of a picture that contain "nothing" are important visual elements that provide balance in an image.

Lighting

By controlling light and directing it where you want it, you can subdue objects or distracting elements in the scene to give more emphasis to the main point of interest. Light and shadows can be used in composition to create mood, to draw attention to an area, to modify or distort shape, or to bring out form and texture in the subject.

Texture

Texture helps to emphasize the features and details in a photograph. By capturing the texture of objects in the photograph, you create form. For example, when people observe a soft, furry object or a smooth, shining surface, they have a strong urge to touch it. Texture gives realism and character to a picture and may, in itself, be the subject of a photo. When texture is used as a subordinate element within the picture, it lends strength to the main idea. Just a little different lighting or a slight change in camera position may improve the rendering of texture in a picture.

Tone

Tone is probably the most intangible element of composition. Tone may consist of shadings from white-to-gray-to-black, or it may consist of darks against lights with little or no grays. The interaction of light against dark shades in varying degrees helps to set the mood of a composition. A picture consisting of dark or somber shades conveys mystery, intrigue, or sadness. When the tones are mostly light and airy, the picture portrays lightness, joy, or airiness.

Contrast

When we speak of contrast as it relates to composition, we are referring to both tonal contrast and color contrast. Tonal contrast is simply the difference between the light and dark areas of a photograph. Color contrast is the perceived difference in a color when surrounded by another color.

Framing

Framing is another technique photographers use to direct the viewer's attention to the primary subject of a picture. An element used as a frame should not draw attention to itself. Ideally, the frame should relate to the theme of the picture. For example, a line of aircraft parked on the flight line framed by the wing and prop of another aircraft.

Foreground

A distracting or unnecessary foreground ruins a large percentage of otherwise good images. An undesirable foreground can be eliminated by moving in closer to the subject, by making pictures with a longer than standard focal-length lens, or by changing viewpoint or camera angle. No object in the foreground should ever be so prominent that it distracts from the subject.

Background

The background is almost as important an element in good composition as the camera angle. Be particularly observant of the background to see that it contains nothing distracting.

PERSPECTIVE

Perspective refers to the relationship of imaged objects in a photograph. This includes their relative positions and sizes and the space between them. In other words, perspective in the composition of a photograph is the way real three-dimensional objects are pictured in a photograph that has a two-dimensional plane. In photography, perspective is another illusion you use to produce photographs of quality composition. When you are creating photos, the camera always creates perspective. When you know the principles of perspective and skillfully apply them, the photographs you produce show a good rendition of the subject's form and shape. The viewer is given the sensation of volume, space, depth and distance.

Linear Perspective

The human eye judges distance by the way elements within a scene diminish in size, and the angle at which lines and planes converge. This is called *linear perspective*. The use of different focal-length lenses in combination with different lens-to-subject distances helps you alter linear perspective in your pictures. When the focal length of the lens is changed but the lens-to-subject distance remains unchanged, there is a change in the image size of the objects, but no change in perspective. On the other hand, when the lens-to-subject distance and lens focal length are both changed, the relationship between objects is altered and perspective is changed.

By using the right combination of camera-to-subject distance and lens focal length, a photographer can create a picture that looks deep or shallow. This feeling of depth or shallowness is only an illusion, but it is an important compositional factor. Using a short-focal-length lens from a close camera-to-subject distance, or viewpoint, produces a picture with greater depth (not to be confused with depth of field) than would be produced with a standard lens. Conversely, using a long-focal-length lens from a more distant viewpoint produces a picture with less apparent depth.

Rectilinear Perspective

Most lenses produce rectilinear perspective typical of what the human eye sees. This is to say that lines that are straight in the subject are reproduced straight in the picture. Fisheye lenses and the lenses used on panoramic cameras produce a false perspective. With a fisheye lens, straight lines in the subject are imaged as curved lines toward the edges of the picture. A panoramic lens produces panoramic or cylindrical perspective.

Vanishing Point Perspective

In vision, lines that are parallel to each other give the sensation of meeting at vanishing points. When parallel lines, either horizontal or vertical, are *perpendicular* to the lens axis, the vanishing points are assumed to be at infinity.

Height Perspective

The higher up in the ground area of the picture (up to the horizon) that the base of an object is located, the further away it seems from the viewpoint and the greater its height perspective.

Overlap Perspective

When subjects within a photo are on about the same line of sight, those objects closer to the camera viewpoint overlap more distant objects and partially hide them.

Dwindling-Size Perspective

The farther away an object is from the viewpoint, the smaller it appears; therefore, when subjects of familiar size are included in a photograph, they help to establish the scale of the picture. Scale helps the viewer determine or visualize the actual size or relative size of the objects in the picture.

CONTROLLED/UNCONTROLLED SUBJECTS

Shooting photos typically falls into one of two categories – controlled or uncontrolled action. As the name implies, in controlled action you control all aspects of the shoot, and most aspects, if not all, are predictable. When you aren't the manager of the action or if the shot isn't predictable, you are shooting uncontrolled action.

CONTROLLED ACTION

One of the most difficult tasks of photographing controlled subjects, such as people, is directing them. Since you are the only person who can see what the picture will look like before it is taken, you must take responsibility for composition.

In Chapter 2, we discussed portrait photography, which is one form of controlled-action shooting. The paragraphs below feature further examples and techniques when shooting controlled action.

Individual Shots

As an MC you will shoot photos of individuals for a multitude of projects, such as news releases, familygrams and cruise books. Therefore, you should be familiar with the methods used to direct photographic subjects.

One way to make directing and posing easier is to give your subject an object to handle. Do not tell him to "just stand there," as though in a vacuum, with nothing to do. Men and women can hold a book, binoculars or a tool used in their work. Children will do fine with a doll or model airplane.

Another strategy is to give your subject something to lean against or sit upon. Use a chair, stool, post or tree.

If you use props in your individual photographs, make sure you do your homework. For instance, do not photograph a gunner's mate holding a three-inch shell in front of a 5-inch gun mount.

Also, pay attention to the eyes. Eyes are very important when photographing people. When the subject's eyes look straight into the camera, a strong and immediate impact is created that attracts the viewer's interest. When the eyes are directed away from the camera, the effect is less explicit and has more of an ambiguous quality. Decide on the best approach for your photograph and direct your subject appropriately.

Finally, you must be in charge of the situation. This cannot be emphasized enough. It is your responsibility as the photographer to direct the scene – tell the subject what to do, how to do it and when to do it. This applies to an admiral as well as a seaman. Just remember your military bearing and professionalism.

Many people are nervous and self-conscious in front of a camera. They try to look their best and, in doing so, often present a stilted expression or pose. It is your job to give directions regarding the pose. It is also your responsibility to make sure that coat sleeves are pulled down and wrinkles are smoothed. Make sure the subject's hat is set at the proper angle. If you ignore these potential problem areas, your photograph will ultimately suffer. Time will be wasted for yourself and for your subject.

Group Shots

Occasionally you will receive an assignment to photograph a group, which adds a degree of organizational difficulty. When shooting group shots, you should consider each person individually, but consider each individual as he relates to the entire group. Every precaution should be taken to ensure each person is shown clearly and interest is not drawn to one person by some awkward pose or expression.

Formal Group Shot

A formal group shot is one in which several people, uniformly dressed for the occasion, are seated or standing in as nearly the same pose as possible. Each member is placed in approximately the same relative position so that attention is not drawn to one person.

Customarily, in a formal group, the highest-ranking person is located in the center of the first row and other members of the group arranged alternately to the right and left, according to grade. When all members of the group are the same grade, arrange them according to height, with tall individuals either in the center or at the ends, or occupying the rear rank.

A formal group of about five people can be composed to fill the picture area very nicely. When six to 10 people are being photographed in a group, arrange them in two rows. For larger formal groups, arrange the people in as many rows as necessary to fill the frame. Avoid stringing out one long, narrow line of people across the frame.

When a large group is formed into three or more rows, you must devise some method to prevent the rear rows from being blocked from view. Furthermore, to compose the picture properly and fill it from top to bottom, you should have each row higher than the preceding one. One method is to arrange the group on the steps of a building, bleachers or terrace, so each row is higher than the preceding one. On level ground the first row can be seated, the second standing, and the third standing on benches. Another method which you can use in combination with the first is to elevate the camera so that it is pointing down at an angle on the group. This method is useful as an aid in composing and filling the picture area. A higher camera angle can be useful in eliminating an undesirable background. Remember, to get maximum depth of field, you should focus the camera one third of the way into the group. For example, if there are nine rows, focus the camera on the third row.

Informal Group Shot

The informal group is intended to depict some action or tell a story about the individuals. Although the position and pose of each member is carefully planned, the results must appear casual and realistic. Members may be seated, kneeling or standing in a variety of positions and do not have to look in the same direction.

One of the most important factors in group photography is arranging people to obtain the best possible composition. Regardless of the number of people in a group, they should be situated to fill the picture and provide the largest possible image size of each person. One exception to this general

rule is when the importance of the background is equal to or greater than the group itself. This often occurs with an informal group when the picture is actually intended to emphasize some object or piece of equipment, rather than the individuals. In this case, locate the camera for the best composition of the object; then arrange the people in the picture to enhance the story being told.

As with individual pictures, you must stay in charge. If you relinquish control, you will have a hard time getting everyone to look at the camera at the same time. Talk to the group and give them your instructions. Make sure your equipment is ready so you do not waste time and lose the group's attention.

ENVIRONMENTAL PORTRAITS

An environmental portrait is a portrait shot in someone's usual environment, such as in the home or workplace, highlighting the person's life and surroundings. When on such an assignment, place your subject in a setting that tells part her story. The background should be simple and non-distracting to the subject but compliment the essence of who you are photographing. For example, if you are aboard an aircraft carrier and want to shoot an environmental portrait of the air boss, shoot the photo in the tower, by the tower or by his aircraft. The environment adds story depth to the photo.

Candid Photography

Common perception within photography is that a candid photo is one that is not set up or the subject does not know is being taken. Photographers have learned, however, that candid techniques can be used just as effectively to make pictures of people they know, even when the people know they are being photographed. The key to a successful candid photograph is for the photographer to keep a low profile (not sneaky).

A candid shot is a candid shot, whether it is of the admiral at a news conference or a "genuine candid" of a Sailor you just happen to see out and about doing his job. The technique is the same in both cases. All that is important is for the pictures not to appear posed. The subjects of candid photographs are not posing or acting; they are simply being themselves and behaving as though the photographer is not there.

The compactness of today's digital cameras make them ideal for candid photography. SLRs with their fast, interchangeable lenses, TTL metering, and large film capacities make candid photography one of the most rewarding areas of our profession. A long focal-length lens is also a good choice for this type of photography. The long lens lets you maintain distance between yourself and the subject, and, if people are aware of your presence, they will not be as self-conscious. If you are taking "real" candid shots, a long lens is a necessity.

When people know you are shooting them, get them to occupy themselves, so they will "forget" a camera watching them. Only then, can you get a truly candid picture. When the person notices what you are doing, ask their permission before you shoot. People usually will not object, particularly if you are polite and work quickly. Stay casual and relaxed. People soon get used to seeing you with the camera, and you will be on your way to some good candid pictures.

Preset your focus and exposure whenever possible so you can respond quickly and avoid attracting attention to the camera. Estimate the likely subject distance, set it on the lens focus scale, and stop down for greater depth of field. Camera handling must be fast and smooth. Time does not allow for fumbling with camera controls, flash equipment, exposure meters, and film loading.

Keep alert, keep looking and keep shooting

Do not try to control the people you are shooting. Let them assume a natural "pose" in an appropriate setting. You may tell them, "Please do not look at the camera." Try to capture the details of their environment in your pictures. This adds interest to what they are doing. And finally, make your candid pictures reflect the people and events around you.

There are situations when you do not have the time for a candid approach, or it just is not feasible. You can still produce interesting people pictures by using the "frame approach." The "frame approach" simply means posing your subject in a situation or environment that is most meaningful to the subject or assignment. (See environmental shots above.)

UNCONTROLLED ACTION

When you photograph people in action, such as in sports or at work, the name of the game is anticipation, staying alert, and expecting the unexpected. Covering action events becomes an exercise in "guesstimating" where the action will take place and firing the shutter at the right moment. A good action photographer relies on his knowledge of the event taking place. Even if you cannot learn the game, a photographer that understands the principles of shooting people in action can do a good job by following a few simple rules: Anticipate the action. Watch for the unexpected moment. Know the mechanical functions of your camera equipment. Practice aiming, focusing, and shooting until they become reflex actions. This leaves your mind free to concentrate on the event. Learn something about the action you plan to photograph.

The best images of people usually have action, implied or apparent. The action should be appropriate to the subject of the picture. By understanding the importance of action in a photograph and the abundance of action available everywhere, you will soon become proficient at recognizing and picturing it. The blur technique has become popular for advertising and illustration use. Panning the camera with the action of a moving subject keeps the subject fairly sharp while blurring the background in a horizontal sweep, and this gives the feeling of action. A similar technique is to focus on the background instead of panning. This will keep the background sharp but show movement in the subject. A slow shutter speed is needed for both techniques.

Accident Scenes

Shooting photographs in the above-mentioned controlled- and uncontrolled-action settings focus on telling the Navy story and promoting the everyday lives of Navy personnel. However, as an MC, you may find yourself in a billet where your job is to shoot accident scenes.

If you are called to an accident scene, remember that current Navy policy specifies that if an accident or incident occurs, the surviving crew members (if physically able to do so) or the first military personnel arriving at the scene of accident must take charge until relieved by proper authority. Therefore, at the scene of the accident, you will be working for the officer in charge (OIC). You report to and receive your orders from the OIC. In many cases, it may be possible for you to accompany the crash rescue party to the accident. The sooner an experienced and qualified photographer can get to the scene of an accident, the better the possibilities of acquiring more valuable photographic evidence. You should commence taking pictures immediately upon arrival. Photographs made before extensive fire damage can reveal information that might otherwise be lost.

Safety of personnel involved is of primary concern in every accident. Rescue operations and removal of occupants from the aircraft, per se, should be among your first photographs. When medical treatment is being given to survivors of the accident, photograph it not only for documenting

the treatment but for the purpose of isolating factual information on human failure. Casualties should also be photographed in the positions they occupy when you arrive on the scene. Photographs of the dead should be made to show the location of the wreckage and the position of each body in relation to it.

You should be advised of any classified material involved, and it should be either covered or removed before photographs are made unless it is important to the accident investigation. This is a situation where close liaison with the OIC is necessary. News reporters may gather at the scene and because you, as a photographer, have something in common with them, they will naturally seek you out. Do not attempt to tell a reporter what to write. Do not make a statement, express an opinion, or provide information about the accident. You are there to document the situation only. Other MCs and PAOs will be dispatched to the scene if necessary to liaison with the media.

Equipment

After learning the nature of your photographic assignment — controlled or uncontrolled — and making a complete analysis of the assignment, you must ensure you have the proper equipment to complete the job. The variety of photographic equipment available and suited for location assignments is extremely broad; for example, the assignment may require the use of a 35mm, digital SLR, or video camera (videography will be discussed in a subsequent chapter). The lighting equipment you choose may range from a small, compact electronic flash unit to a complex array of lighting equipment and reflectors. Exposure meters, color temperature meters, tripods, and interchangeable lenses are just a few of the other accessories you may need on a location assignment.

Be prepared! At one time or another we have all heard this familiar quotation. But have you ever thought what this could mean to your assignment? For want of a gizmo, a photograph was lost; for want of a photograph, an assignment was ruined; and for want of an assignment, your reputation as a photographer was destroyed. No, we are not really concerned with gizmos here. What we are concerned with is your equipment. Do you have everything you need when you get to your assignment and does it work? Nearly all photographic equipment has one or more critical components. The failure or loss of which may put a vital piece of gear out of operation. With cameras, one of these items is the battery, because it may power both the meter and the shutter. Check the battery before you leave the shop, and **ALWAYS** carry a spare. You have a super deluxe all-powerful electronic flash unit that can light up the entire hangar deck in the wink of an eye. Or can it? Did you check it out and was it working before you left the work center? Did you remember the power cord and an extra sync cord? Speaking of synchronization did you make sure the flash was in sync with the camera shutter? Or was the shutter even working? What about the camera lens—is it clean, does it focus correctly? The diaphragm ... is it working?

In the studio, a minor failure usually only causes embarrassment and gives the impression of unprofessionalism. You can usually get a spare camera, lights and tripod into service. But when you are out on location, you are limited in what you can take with you; therefore, it is important that **ALL** your equipment be thoroughly tested and operating correctly **BEFORE** you leave the work center.

SUMMARY

In this chapter, you built upon the theories of light and color found in Chapter 2 and the theories and practices you learned in the public affairs module. You have now added photography to your MC toolbox. From here, we move into videography and discuss your role in electronic

newsgathering. Putting together all the pieces to the MC puzzle will go a long way in ensuring you have a successful career in the field.

(This page intentionally left blank).

CHAPTER 4

VIDEOGRAPHY

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Demonstrate center of interest.
 - Demonstrate image placement.
 - Establish visual perspective (aerial and linear.)
 - Demonstrate pacing and timing.
 - Identify principles of the 180-degree rule (action axis).
 - Achieve overlapping action.
 - Record cut-ins and cutaways.
 - Achieve changes in screen direction.
-

INTRODUCTION

In today's visual society, video has become one the most important tools in the PA/VI community's toolbox. And, MCs are expected to do a lot more than shoot simple home videos. You have the important responsibility of visually telling the story of each Soldier, Sailor, Airman and Marine in the fleet or field, and you must be able to tell that story in a way these men and women deserve. This is not a task you should take lightly.

Unlike some of the older arts that take years of training to produce an acceptable product, anyone can quickly learn how to capture video. However, video techniques must be mastered before you can become an accomplished videographer. Mastery of the fundamentals is the foundation upon which you will build your professional skills as an MC. The important story you're trying to tell depends upon this knowledge. And, while the technology may change, knowing your equipment and the basics of good shooting and editing remain the same. This chapter will familiarize you with the basics of a video camera, the types you will use to do your job, and the practice of using them.

CAMERA OPERATIONS

In order to shoot the best video, under any conditions, you must have an understanding of how to use the equipment you're given. Today, videography is characterized by a rapid growth in the development of technology and ideas. Each year, millions of videos are captured and an astonishing array of new cameras and imaging systems enter the market. One of the great attractions of the video field is the ease with which basic skills can be learned.

Most professional cameras use an optical prism block directly behind the lens. This prism filters the image into the three primary colors – red, green and blue – and directs each color into a solid state (silicon resin) imaging device to translate the optical image into a video signal. These devices, either a charge-coupled device (CCD) or active pixel sensor (CMOS image sensor) are

mounted to the face of the prism. Some high-end consumer cameras also do this, producing a higher-resolution image, with better color fidelity than is normally possible with just a single video pickup.

STUDIO CAMERAS

The studio camera is the backbone of the television industry. It is mounted on a dolly pedestal so the camera operator may wheel it to different locations with relative ease during shot changes.

Television is the process of converting reflected light rays from a subject or scene into electrical impulses and reproducing these impulses at a distant receiver. Television technicians monitor and adjust the video levels of the studio camera with the camera control unit (CCU), usually located in the control room. The CCU consists of a waveform monitor (an oscilloscope that displays a video signal graphically), television monitor and shading control.

Studio cameras are expensive, ranging in price from under \$5,000 to more than \$100,000. However, the more expensive cameras deliver high-quality images in a variety of production conditions. Initial models used analog technology, but are now obsolete, replaced by digital models. Studio cameras are light and small enough to be taken off the pedestal and the lens changed to a smaller size to be used on a cameraman's shoulder, but they still have no recorder of their own and are cable-bound. Cameras can be mounted on a tripod, a dolly or a crane, thus making the cameras much more versatile than previous generations of studio cameras.

Figure 4-1, Electronic newsgathering camera.

ENG and EFP CAMERAS

ENG (electronic newsgathering) video cameras, see figure 4-1, were originally for use by news camera operators. However, these cameras have become the dominant style of professional video camera for most uses in the Navy. An ENG camera is similar to the smaller consumer camcorder, but with some notable differences:

- ENG cameras are larger and heavier, and usually supported by a shoulder stock on the cameraman's shoulder, taking the weight off of the hand, which frees it up to operate the lens zoom control. The weight of the camera also helps dampen small movements
- Three CCDs are used instead of one; one for each primary color
- ENG cameras have interchangeable lenses

- All settings, white balance, focus, and iris can be manually adjusted, and automatics can be completely disabled
- The lens is focused manually and directly, without intermediate servo controls. However the lens zoom and focus can be operated with remote controls in a studio configuration
- Professional connectors – BNC (Bayonet Neill-Concelman) for video and XLR for audio. There are at least two XLR audio inputs
- A complete timecode section is available, allowing time code presets; and multiple cameras can be time code-synchronized with a cable
- "Bars and tone" are available in-camera bars. Color bars provide an industry standard reference signal that simplifies the calibration of setting levels for cameras, monitors and recording equipment when duplicating and transmitting the picture. The color bars are SMPTE (Society of Motion Picture and Television Engineers)
- Recording is to a professional medium like some variant of BETACAM, DVCPRO, direct-to-disk recording or flash memory. If as in the latter two, it's a data recording, much higher data rates (or less compression) are used than in consumer devices
- The camera is mounted on tripods and other supports with a quick-release plate
- A rotating behind-the-lens filter wheel, for selecting 85A and neutral density (ND) filters
- Controls that need quick access are on hard physical switches, not in menu selections
- Gain select, white and black balance, color bar select, and record start controls are all in the same general place on the camera, irrespective of the camera manufacturer. Audio is adjustable manually, with easily accessed physical knobs. Changing the gain for audio and video levels can also affect picture contrast. An adjustment to gain will also increase the level of picture contrast.

VISUAL STORYTELLING BASICS

Videography is a visual art, and it follows many of the same composition basics as photography.

CENTER of INTEREST

Each shot should only have one principal idea, topic, or *center of interest* to which the audience's attention is directed. Two or more equally dominant figures, objects or actions in a single scene compete with one another for the viewer's attention, thus weakening the picture's effectiveness. Subordinate elements within the shot must support and focus attention on the principal feature so it alone is emphasized.

A shot without a dominant center of interest or one with more than one dominant center of interest is puzzling to a viewer. Subsequently, the viewer becomes confused and wonders what the shot is all about. We can prevent this confusion from occurring through the selective placement of our subjects within the scene.

The specific topic, idea or object to be portrayed must be set in your mind as you prepare to shoot a video. When there is nothing in the shot to attract attention to a particular area or object, the

eyes wander throughout the scene. The center of interest may be a single object or numerous ones arranged so attention is directed to one definite area

When the center of interest is a single object that fills most of the shot area or one that stands out boldly, such as a white sail against a background of dark water, attention is attracted immediately to it. As may be expected, not all subjects are as simple to arrange or as bold and impressive.

Image Placement

Although it's called the center of interest, you will rarely place subjects in the center of the frame. Doing so results in ineffective and uninteresting images. Placing the center of interest to one side (preferably the right, dominant side) strengthens the image and increases interest.

A simple method for placing the center of interest in a dominant position is to utilize the *rule of thirds*, (see figure 4-2) dividing the frame into three equal parts, vertically and horizontally. (*Sound familiar?*) The four points where these lines intersect are compositionally strong. Placing the center of interest at one of these areas is a good way to start composing a picture. Using only this method to compose however will produce predictable mechanically composed images. As a loose rule, though, this *rule of thirds* method helps prevent bisecting the picture.

Figure 4-2, Rule of Thirds.

Image Quality

The single greatest influence on image quality is the brightness level. When the brightness level is too low, the recorded image looks grainy and flat. By familiarizing yourself with the brightness level of the subject, you can improve your recordings tremendously. In situations where the light level exceeds 100,000 lux, such as snow-covered scenes or a beach scene on a clear summer day, an ND filter is required. Under other daylight and bright, indoor conditions, the automatic iris is capable of adjusting to provide excellent results. However, in a low-light situation, such as spaces aboard ship, auxiliary lighting may be required to provide clear, sharp images. Another alternative, when available on your camcorder, is to increase gain. By increasing the gain, you increase the level of amplification of the video signal. This increases the contrast and provides a higher-quality recorded image.

In some situations, such as high-contrast scenes or backlit subjects, you must adjust the iris manually. Just like the aperture on a still camera, when the subject is backlit, open up the iris. When the subject is too bright, you must close down the iris.

FRAMING

Framing in videography is the positioning of subject matter within the frame. This definition appears to be very similar to the purpose of composition itself. Admittedly, the difference between the two is so slight that many people use the terms interchangeably. But, take a closer look. Framing is concerned with the positioning of the subject matter in the frame. Composition is concerned with the arrangement of all the pictorial elements of a scene, which includes more than just the subject itself. A scene can have the subject properly framed yet still be poorly composed. Generally, five factors affect framing: field of view, headroom, nose room, close-up and background (see figure 4-3).

Figure 4-3, Framing

Field of View

Field of view refers to how wide or how close the subject appears relative to the camera. It is broken down into five steps: extreme long shot, long shot, medium shot, close-up and extreme close-up. When videotaping people, there are three additional ways of referring to these shots: bust shot, knee shot, two shot and three shot. Another shot commonly used in production is the over-the-shoulder shot.

Headroom

Headroom refers to the location of the subject's head within the frame. It is important to leave some space above your talent's head when composing shots, regardless of shot type. Additionally, it is important to remember that most professional video cameras lose approximately 10 percent of the image they see in their viewfinder. If a shot is composed extremely tight in the viewfinder, chances are you will actually be cutting off part of your subject when the video enters post-production (see figure 4-4).

Figure 4-4, Proper (left) and Improper (right) use of headroom.

Nose room / Lead room

Nose room and lead room (see figure 4-5) refers to the fact that we must leave room in front of a person or object when they are pointing, looking or moving in a certain direction. It is especially important when showing a person as he or she moves, since it helps indicate the direction of travel. If there is no head room as a person moves, it appears as if they are bumping the edge of the frame.

Figure 4-5 – Proper (left) and Improper (right) use of nose room.

Close-ups

A close-up is a normally a full-face shot that fills the screen. When framing a close-up it is important that you take a few steps to eliminate potential confusion. Allow for headroom and show part of the subject's shoulders. When shooting tight close-ups, cut off the top of the subject's head still keeping part of the shoulder in the scene. This is a reference point for your audience.

Backgrounds

Returning after a shoot only to find that an unsightly object appears as if it is growing out of your subject's head is frustrating. Therefore, when you are shooting, always look behind your subject and main center of interest to check out your background. Look for trees, telephone poles,

streetlights, etc. Objects, such as these, in the background can ruin an otherwise perfect shot. It is also important to ensure the horizon is level when you are shooting.

Cut-off Lines

In addition to those five factors listed above, cut-off lines, or cut-off points must be considered when you are framing your shot. When photographing people, there are natural cut-off points that should be avoided – the eyes, nose, mouth, chin, neck, breasts, elbows, waist, knees and ankles. Framing a person so that any of these points sits at the very top or bottom of the screen makes it appear as if the subject's body stops at the edges of the screen. A shot framed in such a manner is very distracting for the audience.

The framing techniques listed here can also be employed when shooting still photographs and working with multimedia products (chapter 5).

VISUAL PERSPECTIVE/SCREEN DEPTH

Perspective is defined as the apparent sense of depth in a picture based on the relative distance and positions of subjects in the frame. It is the relationship of the images in your shot.

Increasing Perspective Results

To increase perspective effects and the apparent sense of depth within your frame, try the following techniques:

- Shoot from camera angles that provide the greatest number of planes or facets of the subject. Angle-on-angle shots, recorded so that the front, side, top and bottom are seen, create more depth than the same subject shot head-on. This is particularly true of large, static subjects such as machinery, buildings and signs
- Position subjects so that they partially overlap. This helps indicate spatial relationships and the audience can determine which objects are nearer by their known size
- Have subjects move between other subjects and objects so that they are partially covered at different times as they travel. Also, move the camera so that it shoots through or past foreground objects as it follows its subject
- Move the subject toward or away from the camera as opposed to straight across the screen. As the image size changes, perspective is increased.

Viewpoint and Camera Angle

The proper viewpoint or camera angle is an important factor in good composition. Repositioning your subject within the viewfinder frame and changing the camera viewpoint or camera angle are two simple ways of controlling composition. Photographing from a different viewpoint or camera angle can often add drama and excitement or even bring out an unusual aspect of a subject. Most of the subjects you photograph are three-dimensional and should be photographed from an angle (to the right or left of and/or from higher or lower than the subject) that allows the viewer to see more than one side of the subject. The photographer should study the subject from different sides and angles. Walk around the subject and look at it from all viewpoints. See it from elevated and low positions as well as from eye level to find the best composition. This greatly assists in composing the subject for the best balance and helps to select a background that compliments, not distracts from the subject.

The terms viewpoint and camera angle are often used in conjunction with one another and sometimes used interchangeably. They can also have different meanings depending on how they are applied.

- Viewpoint – the camera position in relationship to the subject
- Camera angle – the angle in which the camera lens is tilted.

A shot of Sailors marching, made from ground level with the camera held horizontal with reference to the ground, may be referred to as a low viewpoint, (or camera position); however, when this shot is taken again, again from ground level, but with the camera pointed up, it may be referred to as a low camera angle. Likewise, shooting from an elevated or high position, with the camera again held horizontal with reference to the ground, or even pointed straight down, can be referred to as a high viewpoint. If the camera is not held horizontal to the ground or pointed straight down, but pointed at some angle between horizontal and vertical, the camera position could be referred to as a high camera angle.

Eye-Level Shots

With the camera held horizontal, eye-level shots are usually made at a height of about 5 1/2 feet, the height from which the average adult sees, and with the camera horizontal. With the camera held at eye level but pointed up or down, the camera position changes and you have either a low or high camera angle, respectively.

Low Viewpoint and Low Camera Angle

Low viewpoints and low camera angles can add emphasis and interest to many ordinary photographs. A low viewpoint can be used to distort scale or add strength to a picture or to emphasize certain elements within the picture. A low camera angle is achieved when the camera angle is located below the point of primary interest and pointed upward. Low angles tend to lend strength and dominance to a subject and dramatize the subject. Low angle shots are used when dramatic impact is desired. This type of shot is very useful for separating the subject from the background, for eliminating unwanted foreground and background, and for creating the illusion of greater size and speed.

High Viewpoint and High Camera Angle

High viewpoints and high camera angles help orient the viewer, because they show relationships among all elements within the picture area and produce a psychological effect by minimizing the apparent strength or size of the subject.

Like framing, varying camera angles and viewpoints work with still photography.

BASIC SEQUENCE AND SHOT PROGRESSION

Basic Sequence

The basic sequence is the foundation for story continuity. It's a fancy term to accurately describe your video's form and function. Story continuity is the smooth, uninterrupted flow of visual and audio references, which, when assembled in order, tell a story.

Long Shot (LS)

The orderly flow of visual references starts with the long shot. The long shot introduces the scene to the audience and shows the entire area of action for a particular scene – location, people and objects. It is relative to the subject or the location. The subject must be large enough to be recognized, but small enough to establish the location. Compose the long shot loosely, so that people or objects can freely move about and indicate that there is action at the location. Although vital to establishing the scene, the long shot should be used sparingly in a television production. The small size of the TV screen makes it difficult to see everything that's included. In motion pictures, the long shot is used more frequently since the large proportions of the movie screen allow the audience to see all the detail (see figure 4-6).

Medium Shot (MS)

The next shot in the sequence is the medium shot. The medium shot introduces the subject or action by narrowing the center of interest for your audience, typically answering the "what" question of a scene. The medium shot bridges the long shot to the close-up. The subject is the same as in the long shot, now the camera is positioned closer to the subject so that it fills the frame. Like the long shot, the medium shot is composed a little looser so the subject can move if necessary. The medium shot is a transition between the long and close-up shot. It is an essential shot. Many new videographers believe that omitting the medium shot from the sequence achieves a stronger introduction to the main action. The omission shocks the viewer and sometimes is useful, but consistently ignoring the medium shot only results in confusing the audience. If the audience becomes confused, the story is lost (see figure 4-6).

Close-Up (CU)

The final shot is the close-up shot. The close-up is an important and powerful image that draws the audience into the story, focusing attention on the important subject or action. It is the culmination of the basic sequence and should not be used haphazardly. It may seem to be an obvious element to a visual story, but it took early moviemakers years to discover because it defines our subject or action. Selecting the wrong close-up will overlook the point you're trying to make with your story. Using too many close-ups will, once again, confuse the audience as to what's going on and what they should be paying attention to (see figure 4-6).

Figure 4-6, Long shot, medium shot and close-up shot (left to right).

Shot Timing

With each shot, it is imperative that you record extra footage – two to three seconds – before and after the main action. This gives editors “editing handles” before and after our edited clips to leave room for transitions. This will greatly reduce the time required during post-production, making the editing process easier.

Relativity

Relativity is the relationship between the shot you are currently recording, the shot you just recorded, and the shot you will record next. When we discuss shot relativity, we are referring to the distance within a shot that separates the long shot from the medium shot and the medium shot from the close-up. They are all relative to the subject matter being documented, not the location of the shoot (see figure 4-7).

Some believe the location of a shoot, such as indoors or outdoors dictates the distance within each shot. This is not the case. Simply because you have more shooting area outdoors doesn't always mean there will be greater distances between shots. For example, the distances between shots while shooting a parade might be greater than the distances between shots while shooting a picnic in a park. The picnic scene has less to establish than the parade. Also, simply because you have less shooting area indoors does not dictate that we will have smaller distances between shots. A mobility staging area for deploying personnel would have a greater area than that of a military member clearing a weapon. These are relative.

Subject matter dictates the relative distances between shots. For example, a physically larger subject, such as a change of command, will require composing the shot to incorporate all the pictorial elements into the frame. A physically smaller subject, such as a Sailor opening an MRE, does not require as much distance within the frame. Again, it is all relative to the subject matter. Relativity depends on how the camera operator chooses to emphasize the subject within the frame, maintaining story continuity. When we use proper shot relativity, what we see in the close-up will determine the emphasis of our story.

Figure 4-7, A DINFOS student reading his study guide here dictates the distance between the three shots above.

Static Screen Direction

Static screen direction refers to the direction the subject directs his eyes within the shot. Screen direction must be established and maintained even when the subject does not move about within the scene. The direction in which the subject looks should match throughout a series of

consecutive shots. The direction the subject faces can be different from the direction that the subject looks; therefore, the static screen direction is the direction in which the subject is looking. Subjects moving in one direction only in a series of video shots is said to be constant. To maintain static screen direction, the camera operator must remain on one side of the action axis.

Action Axis (180-degree rule)

The easiest method to establish and maintain screen direction is the use of the action axis, an imaginary line that travels across the scene. When there is only one subject in your shot, the line runs through this person and (roughly) perpendicular to the camera's line of sight. When there are two subjects, the line passes through both of them. As long as you keep your camera on the same side of this line, you can set up any shot you want and the subjects will always maintain the correct screen direction. Move across the action axis with your camera, and the screen direction will be wrong.

When the subject moves to a new location a new action axis is established using the *old* action axis as a reference. Some videographers think of the action axis as a left-to-right or right-to-left movement instead of an imaginary line. While essentially correct, it complicates shooting since the travel line must be re-examined for every new camera set-up. If the camera is *always* on the same side of the axis, *directional continuity is maintained*.

The only exception to the rule of recording on one side of the action axis is shooting a neutral shot. In this instance, the camera is placed on the action axis with the camera pointed directly toward the subject (see figure 4-8).

Figure 4-8, Example of moving camera along in relation to the action axis.

Overlapping Action

While watching a television show, have you ever wondered how the action can appear to be seamless from one shot to the next? The appearance of unbroken action from shot to shot can determine the success or failure of a production.

Successful continuity demands a smooth, uninterrupted flow of action from one shot to the next. Continuity is destroyed when there are sudden gaps in the movement between shots. The audience should never be aware of any change in the camera angle or image size. To achieve this smooth flow of images, you must apply the technique of overlapping action. The overlapped shots are later matched and assembled into a story by the editor.

When using a single camera, overlap is attained by *controlled action*, (a situation when all phases of the production can be thoroughly managed). If you do not have complete control over all phases of the video production, overlap may be achieved by using more than one camera. Overlapping action is the extension of activity, at the beginning and end of a scene. By overlapping action between shots you can vary image size, composition, and camera angles and still achieve perfect continuity (see figure 4-9).

Figure 4-9, Example of lack of attention to detail when creating overlapping action.

Factors Affecting Overlapping Action

Before recording overlapping action, consider these factors: the story; control of the action; the subject's action, body position and facial expressions; and dialogue.

If you are shooting from a script, the story is already written down for you. You just have to translate the written words into pictures. Sometimes though, the story is merely an idea and you make it up as you go. If you have a strong story concept, however, you have what you need to overlap the action with or without a script.

Before shooting, your subject must understand the action you desire. You must exercise complete control of your subject and the action. *Rehearsing the shot* is often necessary so the subject knows exactly what is expected from them, allowing the action to be repeated if required. If, however, a position is uncomfortable, or the action is unnatural, listen to the suggestions of the subject; they often have good ideas that will make your story better.

When shooting overlap, the subject's actions, body positions and facial expressions must exactly mirror the last few seconds of the previous scene. This is difficult if your subject isn't

completely aware of the objective of overlapping the action. Take the time to explain this to your talent beforehand and you'll find it easier for them to duplicate their actions during the shoot.

In addition to the action, the last few seconds of dialogue must be repeated. This may seem obvious, but videographers often forget to have the subject repeat their last few lines. When the story is edited later this omission creates a jump in action.

Obtaining Overlapping Action

In a controlled-action situation, obtaining overlap with a single camera is relatively easy. You dictate when the recording begins and when it ends. Since you have command of the situation, you tell the subject to start and stop the action. If there is a problem, you can re-record the scene to your satisfaction.

During the recording, the subject performs the scene according to your direction. After you have finished recording you then compose the next shot. In this shot, the subject repeats the last few seconds of action (and dialogue) from the previous shot. Many novice videographers make the common mistake of having the subject repeat the whole action from the earlier shot. This is *wrong*. This is not overlapping the action; it is merely a re-hash of action with which the viewer is already familiar.

The correct method is to have the subject repeat a small bit from the former scene then move the story along with new action. The action in each shot must reach its natural point of termination. This allows the subject to have a reference for the next shot and the overlap appears to be unforced. The keys to achieving normal overlapping action are planning and rehearsal. Describe the desired action to your subject and let them do it a few times, without recording. Once the subject is comfortable with the scene, then shoot it.

How long should overlap be? Some editors are comfortable with only two to three seconds of overlap, while others want five to seven seconds. A good rule of thumb is to pick a point where there is a natural "pause" in movement or conversation. Overlap four to five seconds of the previous scene. This guarantees editorial options without wasting a lot of videotape.

Recording overlap in a situation when you have no control of the action (uncontrolled action) is far different from a controlled action shoot. It is more difficult, but *uncontrolled action* can be overlapped. In most cases you'll shoot overlap in an uncontrolled situation by having two or more cameras shoot the scene. The videographers must coordinate their roles and actions on the set.

By using different focal lengths and camera angles, the separate cameras record the same subject at the same time, obtaining overlapping action. This can be difficult, even under the best circumstances, but videographers who fully understand their individual roles should have no problem getting all the overlap they need. Care should be used when employing two or more cameras, however. Without planning, simple continuity errors, such as crossing the action axis, can ruin a project that you can't "do over."

When documenting an uncontrolled scene by yourself, it's still possible to obtain overlap. Look for action that is often repeated, such as in the firing of a weapon. The squeeze of the trigger, the ejection of spent shells, etc. These are things that you can shoot almost any time during the action. Try to anticipate what is going to happen. If you're *reacting* to what's going on, you're too late. When possible, find out as much information about the event *before* you start shooting. It is also important to record cut-ins and cutaways to cover major jumps in action. Changing your image size and camera angle also helps mask minor jumps that often occur during uncontrolled action.

Cut-ins and Cutaways

A story that grabs the audience's attention goes beyond the basic sequence. It includes shots that pull the viewer *into* the story in addition to shots that *divert* their attention from the inessential. You are still using the basic sequence, only now you are inserting additional shots to make the story more interesting. These shots, the cut-in and cutaway are critical in maintaining story continuity. Cut-ins and cutaways preserve continuity in five distinct ways:

1. Bridging time and distance
2. Diverting audience attention from jumps in action
3. Building interest or drama
4. Replacing hidden action
5. Covering changes in screen direction.

Bridging Time and Distance

"Omit the inessential." Unfortunately, this simple rule of videography is often ignored. The audience gets bored quickly when forced to watch scenes or shots that have no bearing on the outcome of the story. For this reason cut-ins and cutaways are used to bridge time.

If you documented the construction of a bunker, for example, it would be tiresome to see every sandbag being filled and placed around the pit. Instead, adding a cut-in of a sandbag being filled and a cutaway of the LPO supervising the working party ties the establishing shot of the initial construction to the re-establishing shot of the completed bunker. This greatly condenses the time needed to show this entire action.

Distance is also affected by cut-ins and cutaways. The audience doesn't need to see every step a subject takes moving from one location to another. By inserting a cut-in or cutaway to the sequence, you can omit shots that don't add to the story. Inserting cut-ins of truck tires rolling, and cutaways of exit signs with the names of towns into a sequence of a convoy traveling cross-country, helps the audience understand that a great distance has been covered.

You can *expand* time and distance by inserting additional cut-ins and cutaways. If you want to portray a long road run by a ship's crew, adding extra cut-ins of their feet moving and of the faces of the Sailors, leads the audience to believe that the journey took longer and covered a greater distance than it actually did.

Diverting Audience Attention from Jumps in Action

A jump in action could be anything that distracts the audience from your story: a chair that changes position from one shot to the next, a clock that reads 30 minutes later from the previous shot, or a person appearing in the scene who wasn't shown in the establishing shot. These jumps are not breaks in the story continuity, but breaks in the *visual* continuity. If the attention isn't diverted from a jump in action, the audience becomes distracted and confused.

The average person has difficulty remembering more than two scenes immediately preceding the scene currently viewed. A jump in action is most noticeable in the next scene. Inserting a cut-in or cutaway masks the jump, creating a smoothly flowing scene.

Building Interest or Drama

An otherwise dull story is energized by the skillful use of cut-ins and cutaways. Cut-ins of important actions or dialogue stimulates audience interest. Cutaways of secondary subjects and bystanders reacting to what is happening helps emphasize important actions. For example, in a story of a medical assistance visit to an isolated village, a series of cut-ins showing syringes being filled and children receiving inoculations increases the interest of the audience. Cutaways of villagers watching the corpsmen work emphasizes the action, helping the audience to understand the importance of the visit.

If the story requires a sense of drama or tension, cut-ins and cutaways provide the vehicle. A cut-in to the microphone and mouth of an air traffic controller as she speaks to a pilot and cutaways to firefighters waiting along the runway create a sense of drama as an aircraft makes an emergency landing.

Replacing Hidden Action

Action, which cannot be recorded for reasons beyond the control of the videographer, can be implied by cut-ins and cutaways. As a personnel specialist types information into a computer, a cut-in of fingers dancing on the keyboard or of the clerk doing the typing indicate that administrative work is in progress. A following cutaway shows a card emerging from the printer. A few seconds of cut-ins and cutaways clearly show the process of making an identification card. This same technique may be used on any subject that cannot be recorded because there is no image or for events too dangerous to allow a camera to be present.

Controlled Action

As the name implies, in controlled action you can control all aspects of a production. This includes actors, their actions, the set lighting, and sound recording, if any. You usually work from a well-developed script that includes all the details. If the actors speak, the dialogue is in the script. If the action is described by a narrator, the narration is in the script. If the film is silent, the titles appear in the script. Examples of controlled-action films include training films, some documentaries and historical records, and many publicity or recruiting films. Controlled action, motion-media productions are most often produced by personnel with specialized "C" school or university training. As a non-specialized MC, you will be faced with uncontrolled or semi-controlled action elements of a production or film.

Uncontrolled Action

In a controlled-action situation, everything is normally written in the form of a detailed shooting script. Predictable filming is performed and there are few crises, except the occasional human oversights and mechanical malfunctions. The foundation of uncontrolled-action videography is the basic shot sequence (LS, MS and CU). The other world of motion-video recording (uncontrolled action) is full of crises and surprises. Success primarily is due to good reflexes, accurate guesswork and quick thinking. Careful planning is not the most significant factor. Most of your motion-media assignments will be uncontrolled or semi-controlled action.

Your success as a maker of uncontrolled-action video depends on your knowledge of the capabilities and operation of video equipment. You must also possess a high level of technical skill. There is neither time nor opportunity for research or practice while doing this kind of assignment. You must be prepared in advance. News, sports, special events, and on site-coverage of ongoing activities make up the bulk of this type of assignment. Another class of uncontrolled action is the documentation

of events that follow a known course or pattern, such as parades and ceremonies. These are called semi-controlled, because you know in advance approximately what is going to happen, even though you cannot influence it for recording purposes. Both types of assignments are challenging, exciting, and usually welcomed by confident camerapersons. But, they can be "unfortunate experiences" for those not properly prepared to cope with them. Remember, when shooting video without a tripod, you should deeply inhale, and then partially exhale before shooting.

Uncontrolled and Semi-Controlled Actions

Obviously you cannot develop a specific, detailed plan for shooting uncontrolled or semi-controlled action. You must get as much information about the assignment as possible and in as far in advance as possible. This information helps to provide an estimate of requirements for equipment, supplies, scheduling of personnel, transportation, camera positions, lighting, and other technical details.

Whenever you are assigned to cover distinguished visitor (DV) arrivals, award presentations or special events, you should immediately contact the person or agency in charge of the project. This person is usually the PAO. The PAO can furnish you the full scope of your assignment and provide the following basic information:

- Name and rank or title of the person(s) involved
- Place and time of arrival
- Complete schedule of activities.

When possible, you should personally inspect the location and route of the proposed action (site survey). If this cannot be done, try to get drawings, maps, plans, or photographs of the area. Eyewitness descriptions or pictures of similar events also may be helpful. Ask questions about the location of the subject, the type and direction of movement, and the sequence of actions to be recorded.

With this information, you can draft a rough plan. By working closely with the project officer, you should be kept reasonably well informed and can arrange the shoot in a logical order. Be careful, however, not to "plan yourself into a trap." Expect last-minute changes in your plan, and, therefore, keep alternative plans in mind and ways they can be put into effect quickly. Next, determine shooting requirements and the number of cameras and people you need. Check probable camera locations for the long, medium, and close-up shots. Determine the amount of tape you require, and consider the possibility of some unplanned requirements. Determine whether you will need transportation and additional equipment.

For example, your shop has received the following assignment:

The CNO and his party are expected to arrive aboard your ship tomorrow. The flag requires complete photographic coverage of all official activities of the CNO and his party while on the ship. The division chief has assigned you to cover the motion media.

After you check with the officer in charge of the event, you find that the CNO and his party are expected to arrive by aircraft at 1 p.m. local time. The party consists of the CNO and three aides. The purpose of this visit is to inspect the ship and to present several awards. The CNO and his party plan to depart at 5 p.m. local the same day.

With this information you can now plan your shooting outline. In an event of this kind, you cannot expect to stage or control many shots.

The shooting outline not only serves as a "program" for planning the sequence of coverage, but it also provides a basis for determining camera placement (SEE PREVIOUS CHAPTERS), movement, and shot framing (SEE ABOVE).

MOVEMENT

Good video needs movement — movement in front of the camera, movement of the camera itself and movement of the picture itself (one picture replacing another). The movements necessary for good television are divided into the following three categories:

- Primary movements
- Secondary movements
- Tertiary movements.

Primary Movement

Movement in front of the camera, usually by the talent, is referred to as primary movement. Primary movement toward or away from the camera is stronger than lateral movement, thus creating more emphasis. Diagonal movement is the strongest and most dramatic type of primary movement. Exits and entrances are more impressive when they occur toward or away from the camera. Remember: you should always lead the lateral movement of the talent with your camera. The viewer wants to know where the subject is going, not where he has been.

Secondary Movement

Secondary movement refers solely to the movement of the camera and is normally done in production studios. Secondary movements follow primary movements or to change or adjust picture composition. You also may use them to emphasize or dramatize a certain portion of a production. The secondary movements you will become familiar with are as follows:

- Pan – A pan is horizontal movement of the camera on a stationary pedestal. It is used to follow the primary action. When panning you should avoid *dead space* between subjects. Do this by positioning the subjects diagonally instead of laterally. Prior to making a pan with a camera on a tripod, you should ensure the tripod and camera are level
- Tilt – Tilting is simply pointing the camera up or down. The reasons for tilting the camera are similar to those for panning. For example, the height of an object can be shown by gradually tilting up or on it or by tilting down on something. This builds suspense
- Dolly – A dolly is a piece of equipment that normally requires a small crew to operate. You can dolly-in to increase the size of an object gradually on the screen or dolly-out to decrease the size of the object on the screen. Likewise, dollying decreases or increases the field of view. A zoom lens can be used for the same purpose as a dolly.
- Zoom – A zoom lens can be used for the same purpose as a dolly. During a zoom, the camera does not move; therefore, perspective does not change as it does when using a dolly

- Truck – A truck is a piece of equipment that is basically a tripod with wheels. The camera is used to follow lateral subject movement or you could truck the camera along the objects. In either case, camera-to-subject distance does not change
- Pedestal – A pedestal is used to raise or lower the camera. Pedestalling can provide the audience with a view looking down on the subject or up at the subject. A pedestal may also be used to compensate for tall or short camerapersons or subjects.

Tertiary Movement

Tertiary movement results from a sequence of shots from two or more cameras. When two or more cameras are used, the director selects from a variety of shots to determine what shot will be telecast and at what time. When more than one camera is used, the director can easily emphasize, de-emphasize, or show action and reaction in rapid or slow succession.

Recording from a Moving Vehicle

Sometimes you may have to record from a moving vehicle, such as a truck or a boat. For this type of assignment, the problem of holding the camera steady becomes even more difficult. In this situation you should handhold the camera, because a tripod transmits vibrations and movements from the vehicle to the camera. Keep your weight on the balls of your feet, and keep your knees flexed so you can sway and bend as the vehicle rolls, pitches, or bounces. Watch the horizon in the viewfinder. A tilted or wobbly horizon is very detracting when being viewed. When shooting from moving vehicles you should use a short focal-length lens and a fast shutter speed.

Covering Changes in Screen Direction

Unexplained changes in screen direction also break the continuity of your story. Cut-ins and cutaways help cover these movements. To do this, the shot must have no screen direction of its own. In these neutral shots the subject moves directly toward or directly away from the camera.

Changes in Screen Direction

If a subject constantly moves in only one direction throughout a video, the audience becomes bored from the repetition and the movement is farcical. Your stories will often call for logical and reasonable changes in screen direction.

The first key to screen direction is that *any change in screen direction must be motivated*. The usual reasons for varying direction are to show a return to the starting point, to show the subject has moved to a new location that is in another direction, or to avoid physical obstacles in the path of the subject or videographer. Regardless of the technique you employ, the two key shots utilized when changing screen direction are medium shots and close-ups. There are four ways to change screen direction:

1. Show the change on screen
2. Use neutral shots
3. Use prominent landmarks
4. Use cut-ins and cutaways.

Show the Change on Screen

The simplest way to change screen direction is showing the change on screen. If the established screen direction is right-to-left, the subject moves in that direction, and then while the camera is still recording, the subject turns in the frame and moves along a new action axis traveling left-to-right.

Use Neutral Shots

Recording a neutral shot allows you to cross the old action axis and establish a new direction of travel. If you use a tail-away shot, follow with a head-on shot to tell the audience there is more to come, unless it is the end of the story. If you use a head-on shot, however, you don't need an additional neutral shot. The next shot can be on the other side of the old action axis.

Remember: *Neutral shots must be absolutely centered in your frame.*

Use Prominent Landmark

A more difficult and rarely used technique to change screen direction involves using a prominent landmark in the background to orient the audience. This approach takes some planning and is *limited to objects that can be immediately recognized*. The static screen direction and placement of a landmark, such as a statue or building, orients the audience to the changes in dynamic screen direction of the subject.

Use Cut-ins and Cutaways

Cut-ins and cutaways do not show the change in screen direction, they merely mask it. The cut-in and cutaway must be a neutral shot. Since the average person has difficulty remembering the two scenes immediately preceding the current scene, cut-ins and cutaways should be used in pairs in order to mask the change.

PACING and TIMING

Broadcast news reporters will tell you that in any story, pace is everything. This means that the viewer will lose interest if a story does not develop or is dull, boring or predictable. Simply put, when you watch a program, the pace either feels right, or it doesn't.

When capturing a story in the field or fleet, it is *content that dictates pace*. Is the action fast-paced? Is the story quiet and serene? These are questions that must be answered to understand and determine the pace of a story.

But shot length is only one element of pacing. The composition within sequences is just as important. A subject may seem to move slower or faster simply by moving the angle of the camera in relation to the action. Focal length, lens to subject distance and lens perspective all play a part in determining pace. If a long shot is of a subject running from left to right and the medium shot is of the same person running toward the camera, the pace of the person seems to be at two different speeds. So even if it's right, but it looks wrong, it *is wrong*.

Timing while videotaping concerns compressing real time into filmic time. In a briefing or documentary, an entire day's activities can be shown in a five-minute presentation. Planning shot sequences is the key, one shot ahead, your current shot, and one behind. In essence, video of the

President arriving at a naval air station may take 45 minutes from touch down to the time he climbs into a vehicle. But, that story can be told in a series of shots lasting no more than 45 seconds.

ADDITIONAL SHOTS

The basic sequence is the foundation of video storytelling; however, such storytelling is not limited to the three shots of this basic sequence. There are many variations of each that are used in addition to the basic sequence. Sometimes these additional shots are used instead of, or along with shots in the basic sequence. Three common shots are the extreme long shot, the full-figure shot, and the extreme close-up. Used properly, these shots can enhance your story by providing important information to the audience.

Extreme Long Shot (ELS)

The extreme long shot provides the audience with a distant view of an area. It establishes physical character or a distinctive atmosphere and always precedes the long shot in the basic sequence. It is best recorded from a high vantage point to provide more viewing area.

Full-Figure Shot (FFS)

The full-figure shot is a variation of the medium shot depicting the whole subject. It shows the subject from head to foot, containing very little headroom or footroom. It is often used in place of the traditional medium shot.

Extreme Close-up (ECU)

The extreme close-up often follows the close-up in the basic sequence. It magnifies the subject for detailed examination completely filling the screen. It is often used for dramatic emphasis or to show important details within a scene. A scene shot to the right of an edit control unit, showing someone's hands using the equipment is an example of an extreme close-up.

VARIATIONS OF THE BASIC SEQUENCE

You're now familiar with the shot sequencing and the various types of shots. Hopefully, you understand how the visual storyteller uses these shots and the sequence to piece a story together, shot by shot. While the basic sequence of long shot, medium shot, and close-up is the most common sequence used to tell a story, it is not by any means, the only one. There are numerous variations available, depending on the information you are trying to convey or the way you want the audience to react.

Extended Sequence

Adding the extreme long shot, full-figure shot and extreme close-up to your shot progression changes the basic sequence into the extended sequence. This new shot progression enriches the visual quality of your story and enhances audience attention. It is important to understand however, that you do not have to insert all additional shots to be considered an extended sequence. It can be only one, or a combination, if desired.

The extreme long shot, when added, impresses the audience with the huge scope of the scene. A large military base, vehicle convoy, or aircraft-parking ramp can be impressive opening shots to introduce a sequence. Such massive shots set the scene for what follows by putting your audience

in the proper mood and giving them the overall picture before introducing characters and establishing the story line.

Including more medium and full-figure shots improves your storytelling ability. These additional shots provide more information to help explain complicated ideas. For instance, in a sequence of a division officer talking to his shop, the first medium shot shows the face of the captain and the back of the head and shoulders of the Sailors. The second medium shot then shows the face of the LCPO as he acknowledges the DIVO's words and the back of the head/shoulders of the DIVO.

You can also emphasize or show tiny details by using the extreme close-up. When placed in the sequence extreme close-ups help the audience understand complex and minute details certain jobs require.

Reverse Sequence

Sometimes it is desirable to startle, confuse or withhold information from the audience. When this is the case, a close-up may be used as a dramatic tool for opening a sequence. Then the sequence continues backward to the long shot. This is called reverse sequencing. Let's start with a close-up of a set of eyes, move to a medium shot of a Navy SEAL in camo paint, then out to a long shot showing this Sailor in full combat gear, camouflaging himself in the jungle. That simple reversal of the basic sequence immediately draws our viewer into the story, making them want to see more.

A properly planned, effectively recorded reverse sequence will enhance your story, as long as you don't overuse it. Using too many reverse sequences not only bores the audience, but the punch of your story will get lost. A good rule of thumb is to use the reverse sequence only after you've determined the action requires immediate attention.

VIDEO EDITING

Non-linear editing is an amazing process. Gone are the days where we made linear edits. Linear meant that everything was laid out in sequence and no changes could be made to an earlier time in that sequence without affecting the rest of that sequence. With non-linear editing you can move, cut or add media at any point of the sequence without messing up the rest of it. Knowing how to edit is an important tool for MCs to have in their toolbox. You might be able to shoot great video, but if you don't know how to put it all together, your job isn't complete. The orderly structuring of facts, ideas and abstract suggestions in any visual-editing process is continuity. This section will give you the basic fundamentals you'll need to become a skilled basic editor and help you achieve your final goal – having a product that tells an effective memorable story.

EDITING HARDWARE and SOFTWARE

Let's first take a tour of the hardware components that make up a non-linear editing system. Regardless of the particular system you use, the basic components are the same.

- Central processing unit – the computer portion of the system that contains computer-related hardware and software
- Monitors – one flat-panel or two 16:9- or 4:3-aspect ratio monitors used for viewing
- DVCam Deck — used to input and output video
- Speakers or headphones – for listening

- Keyboard and mouse – for controlling the editing software.

PROJECT HIEARCHY

Project

The project is at the top of the project hierarchy. It is a non-linear editing system's device for organizing your work. The project contains all files associated with your project. When you create a new project, navigate to the drive where you will save your project and name your project. Everything you do in this project will be saved in this location. The project folder contains all files of your project like the video, audio, graphics and project settings.

Bin

A bin is the electronic equivalent of a physical bin in which film is stored for retrieval during editing. The bin is simply a file containing clips and sequences and provides a simple way to organize a group of like elements. Bins are stored in the project folder and organize your assets, such as video clips, audio files, still images, graphics and sequences. Each listed media asset is a link. The files themselves remain in their file folders, while the assts are stored in bins. Bins behave like folders as a way to organize your assets visually within an editing program.

Clip

A clip is stored in a bin and contains information about the source of the material – tape name, start and end time codes, and so on – and the way you want the information to be captured.

Sequence

A series of shots or scenes that includes a beginning, middle and end (like a chapter in a book). A short movie can contain a single sequence, or several sequences can be put together to create a longer movie.

A sequence is your edited program. You create a sequence by editing clips together. A sequence is stored in a bin and holds references to its clips. The internal drive is the storage device on the system. The drive works like desk drawers and contains folders and files for storing information including applications, projects and bins. The basic editing model for editing system is very simple. There are three steps to converting raw footage to master tape:

- Digitize or capture
- Edit
- Output.

Creating a sequence can be as simple as stringing together as series of shots with some narration or music or more complicated with multiple audio tracks, sound effects, dissolves, wipes or special effects.

Now that you have seen the basics of an editing system, you need to know how to get that great video you shot into your editing system or program of choice. All systems have some way of capturing or importing your media. It's very important to understand this tool and function because without it you can't actually accomplish anything.

Once capturing, or importing, is complete it's time to become familiar with your footage and begin to think of an outline of how you want your video to flow. The next phase in the editing process is to sub-clip all of your useable footage.

Sub-Clipping

The process of going through your media and making it into smaller, more manageable files is called sub-clipping. Organization of your files is very important, but sub-clipping also benefits you. Sub-clipping gives you the chance to become familiar with your footage. Knowing your footage inside and out is important and will help speed up the process when you go to actually put the video together. You will know what shots you have and what shots you don't.

Once you have all your video captured, organized and sub-clipped. It's time to produce your spot, prime cuts video or All Hands Update. The two basic editing techniques you'll use in video are *continuity editing* and *compilation editing*.

NOTE: The editing procedures and techniques in place at your command may differ from what is portrayed in this section.

Continuity Editing

Continuity editing is the most commonly used method of editing video for news or feature releases. It is used when the storytelling is dependent on matching consecutive scenes. Continuity cutting consists of matched cuts in which continuous action flows from one shot to another. The three transitional devices associated with continuity cutting are the cutaway, cut-in and crosscutting.

Cutaway

When the action shown is not a portion of the previous scene, a transitional device, known as a cutaway, is used to change positions, movements or characters or to denote a lapse of time. This eliminates a mismatch, or jump cut, that would cause the segment to appear jerky or out of sequence.

Cutaways are often termed *protection*, *reaction*, *insert* or *cover shots* and are thought of as secondary action shots. For example, if the main story is about a parade, cutaways of close-up shots of the crowd would be suitable. Children may be shown watching intently, eating candy or applauding; adults may be wearing different expressions of emotion or carrying children on their shoulders. These shots are of human interest and are related to the primary action, but are not actually a part of it. If you have a good selection of cutaways, you can make a great story out of an otherwise drab and commonplace event. The cutaway can cover a multitude of camera operator errors and result in the formulation of an exciting segment. Cutaways should last between three and five seconds.

Cut-ins

Another method used to denote a lapse of time is the cut-in. Unlike the cutaway, the cut-in is a part of the primary action, rather than the secondary action. For instance, to denote a person climbing a long flight of stairs, you establish the individual at the start of the climb, and then cut to a close-up of feet as they take the steps. After you establish the shot (three to five seconds), you cut back to the person at the top of the stairs. A person can appear to walk a city block in just a few seconds by showing feet walking or a hand carrying a briefcase.

Crosscutting

Crosscutting is the old standby of editing. In crosscutting, you use shots from two different actions or events that will finally be related. A time-honored example is the "meanwhile, back at the ranch" style, or the hero riding hard to save the life of the heroine who has been chained to a buzz saw by the villain. The action would be cut back and forth between the desperate rider and the saw as it comes dangerously close to the heroine's head, showing the progress of each, then finally relating them as the rider arrives at the last moment to save the heroine.

Compilation Cutting

The second method of editing is compilation cutting. This is used in documentary-style stories of surveys, reports, history or travelogues. Segments can be tied together through narration, but not always. The narrative explains the shots, which may have little or no matching relation. These shots or scenes may be long or short shots, or they may go from long shots to close-ups without any special transitions. Compilation cutting is used for putting together Prime Cuts.

Once you're done with your rough cut, trimming is used to tighten up transitions, change the length of a scene, or adjust the timing and pacing of your story.

The technical side of the editing process is fairly easy to learn. With today's technology, the procedure is almost foolproof. Some editing systems allow you to use time-code editing to set all of your edit in and out points ahead of time, including special effects, graphics and audio and video mixes and dissolves. The capabilities of your editing system will control the number of special effects you will be able to use with your video. The latest software programs available allow you to produce professional looking, broadcast quality video, with minimal manpower. Nevertheless, a good editor must have a thorough knowledge of many related skills to provide viewers with a simple, yet effective, message.

Exporting

There are a variety of ways one can export a video project and each editing system has its own unique workflow. Nearly all non-linear editors allow you to export your edited video. The format you use is usually determined by the customer. However, it's your job as to ask where the video will air. Will it be viewed on the Web or in a large auditorium? The answers to those questions will determine what compression needs to be applied to the exported video. If the file size is too large it will not play well on a computer. If the file is too small and you attempt to project it in a large venue the video will look pixilated. It's important to understand the video you edit is considered to be in its rawest format and when you export, you are either compressing or transferring the editing files to tape. The exporting process can be expedited if you mix down the video tracks in advance. This process is also known as compression. Compressing and or exporting can become very involved. In fact, there are several good programs out there used explicitly for compression/exporting. For more information on compression refer to Chapter 7 of this manual.

SUMMARY

The sharing of thoughts and facts through the spoken word and vivid imagery shapes our lives. As an MC your job is to portray events in a clear, concise and interesting way. In this chapter you were introduced to the basics of a video camera and the most important tool there is for visual storytelling – the basic sequence. Remember, continuity is the thread that binds your video together. Once continuity is broken, the audience becomes confused and eventually loses interest in your video. Visual continuity preserves the essence of your story. Consistently using clean entrances and

exits provides a logical transition of the comings and goings of characters in the scene. The lack of directional continuity will always distract the observer from the story. Use the action axis to establish and maintain screen direction. You will often need to change the subject's screen direction, but remember this change requires a motivation and must not break the continuity of your story.

As you become more experienced in the art of visual storytelling, you will find that maintaining continuity is not hard, but it requires you to be ever vigilant against those jumps that can disrupt your narrative. The last thing we discussed was basic editing and how to get the video you captured onto your computer. Depending on where you're assigned will determine what editing software you use. Therefore, we only discussed the basics of all professional editing systems. In the next chapter will discuss the basics of multimedia and how it applies to your job.

Now that you have thoroughly reviewed the videography chapter, take some time to visit the [video gallery](#) on Navy.mil. As you review these videos, look for the lessons you learned here. Keeping up with industry standards and reviewing what others are doing will keep your product fresh and up-to-date.

CHAPTER 5

MULTIMEDIA

Learning Objectives: *Upon completing this chapter, you should be able to do the following:*

- *Define multimedia.*
 - *Explain difference between raster and vector graphics*
 - *Define principles of design for various multimedia projects.*
 - *Understand the principles of animation.*
 - *List the stages of authoring a movie.*
 - *Explain Section 508 compliance in relation to website management.*
-

INTRODUCTION

As taken from the pages of the Defense Information School's (DINFOS) handbook on multimedia authoring, multimedia simply defines product created by incorporating different elements of media, such as text, audio, still and motion images, animation, etc. It's taking the many forms of storytelling you have learned in this module and the previous manual and putting them together as a package to better convey your message.

In this chapter, we will speak of specific multimedia products and touch on the basics of each:

- Digital graphics
- Multiple-page layouts
- Electronic presentations
- Movie authoring and animation
- Websites.

DIGITAL GRAPHICS

In addition to the written word, photographs and video, all of which have been discussed in previous chapters, digital graphics play a key role in the creation of multimedia products. For our purposes, digital graphics fall into two categories – raster and vector (see figure 5-1).

In this chapter, we will focus on vector graphics, because we more often equate raster images to photography vice digital graphics. However, photos are as important to multimedia products as vector graphics.

Figure 5-1, A vector image enlarged vs. a raster image enlarged proportionally.

Raster graphics use pixels to create an overall image and are often referred to as bitmap files. Raster graphics are resolution dependent, which means that you cannot increase their size without losing quality, see figure 5-1. Vector graphics are considered object-oriented graphics and are created from points, lines, shapes and curves that are based on mathematical formulas. These elements are filled with color, blends, tints or gradients, while lines have a stroke attribute, such as a solid or dashed line with different thicknesses and colors. Separate parts of a vector graphic are individual objects that can be changed independently of each other.

Vector graphics are resolution-independent, meaning when you reduce or enlarge the image you are only changing the mathematical formula that defines the object. This attribute makes vector-drawing programs ideal for artwork, such as logos, that need to be displayed or printed at different sizes. Vector software should not be used to edit photographs, because photographs are raster images made up of pixels and cannot be separated into individual objects.

Raster-based Software

Raster images create an image using a point, or hundreds of points, of light in a matrix. These images are slower to manipulate and create than vector graphics, but more spontaneous and easier to learn. A multi-layering, raster-based matrix with distinct grid-mapped forms is called raster-based imagery. Raster-based images create painterly (like a painting) effects and encourage creativity. They also require an enormous amount of processor power and memory that can slow program execution. To modify or create in the raster mode is to work at the pixel level which can be time consuming and tedious. Examples of programs that are raster-based are Adobe Photoshop™, Microsoft Paint™ and Corel Photo Editor™.

Vector-based Software

Vector-based software is ideal for drawings, charts, graphs and diagrams. It creates an image by defining line, position, shape, and fill pattern. You plot, or vector, a series of points to define a shape. This shape is calculated into a mathematical formula called an algorithm. Image manipulation and editing is automatically calculated by the computer when you change parameters, making modifications easy and fast. The use of a vector-based program requires preplanning and more computer savvy than a raster-based program. Examples of vector-based programs include Adobe Illustrator™ and Corel Draw™.

Using Software Programs

In order to become proficient with graphics and graphics software, you must practice, practice, practice. However, remember that computer equipment and software can never replace your own creativity and ingenuity. You must gain the knowledge to master the program or programs and use these tools wisely. Sit down, read the owner/user manual, and experiment with the computer.

Drafting, drawing and painting are distinctly different functions and not all programs will be equally adept at processing all three. Base your choice of program on command requirements. Also, let your software drive your hardware. Select a software program that fulfills the needs of the command and allows for some growth. Purchase hardware based upon software requirements. Invest in the very best monitor possible. All of this affects the graphics resolution, the ease of processing, and the final product.

Vector Terms

Now that you understand the basics behind vector graphics and how they are different from raster graphics, let's talk about some terms you need to know before you start using vector-based software.

Bézier Curve (pronounced Bez-ee-ay) – Developed by the French engineer Pierre Bézier, these curves are the basis for all images formed in a vector-based drawing. Originally created to put designs of aircraft on a computer, they were later used for designing cars. A Bézier curve is a combination of points on a path with anchor points at the ends of the path and two points coming out of the anchor points to control the amount and direction of curve. These points are called direction points. The concept behind all these lines and curves is to control the shape of the curve by moving the direction points.

Paths – Vector-based programs use paths to create objects that make up the drawing of the image. A path is a shape formed by lines connected at points, called anchor points. Paths can be changed and are easy to manipulate. Paths can be moved, resized and colored. The three basic types of paths are open, closed and compound.

- An open path is a path that has two distinct end points with any number of anchor points in between. Straight lines, arcs or curve lines are all examples of open paths
- A closed path is a path that forms an enclosed area with no starting or stopping point within that closed path. However, there can be any number of anchor points along the path. Examples of closed paths would be a circle, rectangle or star
- A compound path is a combination of open and closed paths. A compound path can be any shape or size. It can be easily identified because the open areas of the shape allow you to see through it. A doughnut drawing would be an example of a compound path.

Fill – To fill means to add color or pattern to an open area inside a path. A gradient can be created and used to fill an object. A closed path, a circle for example, will be filled in the inside of the path area. An open path, an arc for example, will be filled inside the path, but will stop at the invisible straight line connecting the end points.

Stroke – To apply a stroke means to take a path defined by the shape and trace it. A stroke can be applied to any path. A stroke color or pattern can be changed using the color or swatches palette. A stroke weight or thickness can be changed using the stroke palette. The Miter Limit option determines how far the stroke sticks out on a sharp corner.

Anchor Points join two segments of a path and can be edited. They can be placed manually or using the tools provided to place an anchor point where needed. It is important that you use as few anchor points as needed to create a path. Be careful when editing, you must remember that using more anchor points makes it more difficult to edit. That being said the more anchor points you use the more precise and detailed edits you are able to make. Four types of anchor points:

- Smooth Points have a curved path and no noticeable, abrupt change of directions, like an "S"
- Straight Corner Points occur where two straight lines meet, typically at a corner or anywhere there is an abrupt, distinct angle formed at the juncture of two paths, like a "V"
- Curved Corner Points are found at the junction of two curved lines that abruptly change directions when they meet, like the number "3"
- Combination Corner Points are found where a straight line meets a curved line, like the number "5".

Viewing Modes – Most vector-drawing programs provide three viewing modes to view your designs – outline, preview and preview-selected.

- Outline Mode displays the paths for the objects you have drawn; it shows no color, shading or other graphical effects
- Preview Mode shows what you will get when you print the illustration
- Preview Selected Mode shows the stroke, fill and color of the independent selection only.

Digitizing Tablets – A digitizing tablet (see figure 5-2) is an input device to help you enter drawings and sketches into a computer. It is most needed when converting an analog drawing or image, or re-drawing a low-resolution graphic. Operation consists of an electronic tablet, wireless mouse and/or pen. A pen (also called a stylus) looks like a simple ballpoint pen but uses an electronic head instead of ink. The tablet contains electronics that enable it to detect movement of the cursor or pen and translate the movements into digital signals that it sends to the computer. Each point on the tablet represents a point on the display screen in a fixed manner. This differs from mice, in which all movement is relative to the current cursor position. The static nature of digitizing tablets makes them particularly effective for tracing drawings.

Figure 5-2, Example of digitizing tablet.

FILING GRAPHICS

According to the SECNAVINST 3104.1A, [Navy Visual Information Program Policy and Responsibilities](#), the marking and filing of all graphics must be made in the same manner as photographic images to include security classification, VIRIN and name of creator.

The VIRIN format, as of February 1, 2011, changed. See chapter 7 for more information.

MULTIPLE-PAGE LAYOUTS

Brochures, newspapers, newsletters, event programs, etc., are a few examples of multiple-page layouts you may be assigned to create during your time as an MC. Each brings together digital graphics with the other types of media we have discussed throughout this manual. Strategically placing these items together to create such a product is referred to as layout and design.

Layout and design affects the placement of different items as well as the relationships among them. It's like identifying your favorite ingredients and making your favorite dish. You need to know which ones and how much of each you need to use. The principles of design determine what you do with these items and how you do it. Within a layout, these principles also affect where you place the items and why.

PRINCIPLES of DESIGN

The four principles of design are balance, rhythm, emphasis and unity. When creating a layout, think about how each of these principles will enhance your layout, make it visually appealing or better communicate your message to your audience.

Balance

Balance is the perceived equal distribution of weight in a design. Balance refers to how items are arranged horizontally or vertically in a design. It creates a feeling of steadiness and of things looking as if they belong where they are. Layouts that are balanced seem complete to the eye. The two approaches to balance are symmetrical and asymmetrical.

Symmetrical balance is also known as formal balance. It is the arrangement of elements so they are evenly distributed to the left and the right of the center. In other words, one side mirrors the other, and all items on the page are centered and balanced. Symmetrical balance communicates strength and stability. It is mostly used for traditional or conservative layouts.

The opposite approach is asymmetrical balance, or informal balance. It is the arrangement of an object or objects of different weight on the page, which are not placed uniformly. Asymmetry relies greatly upon the optical weight of elements. Optical weight is a system of visual measure based upon the following ideas:

- Dark elements weigh more than lighter ones
- Color weighs more than black and white
- Big elements are heavier than smaller ones
- Bright hues are more weighty than muted hues
- Irregularly shaped elements have more weight than normal shapes.

Balancing an asymmetrical design requires the use of such elements as color, value, size, shape and texture. Asymmetry brings contrast, variety, excitement, movement, surprise and informality to your layout. It is most appropriate for pieces that entertain and inform.

Rhythm

Rhythm is used to achieve movement and is the visual progression of repeating elements in a varied pattern. Rhythm is often associated with music; for example, a waltz with a smooth, flowing rhythm or a polka with a lively rhythm.

The two key elements of using rhythm in your layout are repetition and variation. Repetition is the repeating of similar visual items in a consistent manner, and variation is a change in the size, placement or form of visual elements.

Repetition unifies a layout. For example, to make text easy to read, use even columns. However, too much repetition without variation can make for a boring layout. To vary your layout, you can add headlines, sub-headlines and images. Headlines are discussed in Module 1, Chapter 6.

Rhythm communicates feeling or mood. To establish a calm and relaxing mood, you should place your elements at regular intervals, creating a smooth, even rhythm. To establish a more dynamic mood, vary the size and spacing of the elements. The latter is used often in advertisements to keep an audience's attention.

Emphasis

In design, emphasis means that one element stands out amongst the others, capturing more of a reader's attention. As the layout and design editor, you emphasize the element you want people to notice first and foremost. Color is a great way to emphasize an element.

Remember back to the previous chapters on photography and videography. Do you recall that within both types of media, having a focal point within the images was vital to good storytelling? The same is true with layout and design. In any product, you must have a focal point or a spot in your layout that captures your reader's attention and keeps him there to check out the rest of the piece. Having too many focal points, however, confuses your reader. Emphasizing everything means emphasizing nothing.

After you choose the element you want to emphasize, you can choose from several methods to call attention to it. Generally, a focal point is created when an element differs from the others. For example, if you are working with a vertical layout, you can use a horizontal item, such as a horizontal photo, as your emphasized element. Other ways to use emphasis include:

Unity

Unity helps the elements of your layout look like they belong together, by providing visual cues to your reader that tells them which parts of the layout go with other parts of the layout. For example, in a newspaper, unity holds together a headline, story and the associated image.

Three ways to unify your elements are by grouping, repeating or using grids. Grouping means that the elements are close together on the page. Repeating elements through color, shape and texture create unity. If you are using an image of the American flag, you could pull out the color blue from the flag and use it for other elements on the page. A grid system, also referred to as modular design, is a division of page space into columns, margins or space. A grid establishes a framework for text, graphics and images.

Variety keeps unified layouts from being boring. For example, you can create a theme with circles in your layout. Circles and the variations of circles in different sizes and shapes create unity, but variety, at the same time. The elements remain related within the circular design, yet varied enough for interest.

ELEMENTS of DESIGN

The process of layout and design is neither an exact science nor magic. Layouts are tried and discarded many times before the right one is found. However, knowing the basic principles and elements of design and how to use them will help you make good choices. In this section, we will discuss seven elements of design often used in the industry – line, shape, texture, space, size, value and color.

In any given layout, it is important to know which of these elements are necessary and which are not in order to create a successful, clutter-free layout.

Lines

Lines are everywhere. There are straight lines, curved lines and squiggly lines; fat lines, skinny lines and dotted lines. Lines are used to organize, direct your reader's attention, or create mood, rhythm or movement.

- Horizontal lines can represent rest or relaxation in one instance or stability in another
- Vertical lines often show strength
- Vertical lines suggest movement
- Curved lines suggest many things depending on how they are used. They can show weakness, or they can show elegance, beauty or gracefulness.

Shape

Shape is any element with a given form that has height and width. Shapes communicate ideas. For example, a logo used for an international company could use a circle to represent the earth. Unusual shapes attract attention. Arranging text into a shape can be used to draw attention.

Shape enhances a layout in three ways – gives your reader a place to begin by acting as a focal point, sustains the reader's interest by breaking up pages with an overabundance of text, and organizes and separates to add variety.

In layout and design there are three common types of shapes. Geometric shapes, like circles, triangles, squares and rectangles, are regular and structured. These shapes make excellent building blocks for design. Natural shapes include animal, plant and human. They are irregular and fluid. For example, instead of using a rectangular shape on your page, you could use ivy (if appropriate) to give the page a light, airy feeling. Lastly, abstract shapes are simplified versions of natural shapes. An example of an abstracted shape is the symbol of handicap accessibility, which includes a figure in a wheelchair.

Texture

Texture gives a design the look or feel of a surface. Think about the many textures you encounter every day – the bark of a tree, the roughness of the sidewalk, the smoothness of a sink

basin, grooves on a steering wheel, the short or long fur on your pet, etc. In design, texture communicates through an imagined sense of touch.

Texture creates a particular mood, while adding dimension and richness. To demonstrate this, try printing your layout on different textures of paper using embossed type. Embossing means to create a raised surface.

Two types of texture are used in layout and design – tactile and visual. Tactile texture can be felt, while visual texture creates the illusion of texture on a printed piece. Wallpaper is an example of visual texture. Patterns often lead to visual texture. When an image or line is repeated many times, the patterns of lights and darks add dimension to the surface. Patterns make excellent backgrounds and borders in layouts; they add rhythm and movement.

Space

Space is defined as the distance or area between two items. Effective use of space in design leads to attractive, organized and functional layouts. When designing a layout, you must think about where you are going to place the text and imagery. How much space must you place around and between each item? You must also consider your total amount of work space on the page, how each element works together, and the overall appearance of your layout.

The space between and around the items is referred to as white space or negative space. It creates a rest for the eye and visually organizes the layout. White space between columns of text, for example, provides boundaries to allow the reader to move through the text easily.

Placement and value of shapes on a page create spatial relationships and focal points among the items on the page.

Size

The fifth element is size, which is how big or small something is. Size plays an important role in ensuring the layout is functional, attractive and organized. You can contrast small and large items to attract attention, reinforce importance or create relationships.

Value

Value is the darkness or lightness of an item, giving it shape or texture. In design, every item has a value. When laying out pages, an item's value is affected by its background and the other items around it. For example, a lot of text in a small area on the page will cause the paper to look gray.

Value can express a theme or mood. Using black, white and gray in your design adds power or changes the mood. Value establishes contrast by subtly blending shades of color or black and white. Low contrast creates a calm, quiet mood; high contrast conveys a feeling of drama or excitement. Using only light values gives a piece an unstable, subtle feeling.

Movement and direction can be affected by value as well. If you place a single black dot on a white background, you get great contrast between the foreground (the dot) and the white background. If you add a second dot below the first, the dots will appear to have equal importance. If you give the second dot a 50-percent shade, the value of the second dot creates movement and direction (see figure 5-3).

Figure 5-3, Example of changing the value of an item within a layout.

Color

The final element of a good design is color, which is the ultimate tool for symbolic communication. Decisions about color should be made with much thought to ensure the success of your layout.

Color conveys mood, identifies objects and relays messages. Like value, color also can evoke moods and emotions.

How you use color, however, makes a difference in the final product. You can pick a color from a photo for a background color in the layout to achieve a specific look. Repeating colors from a photos of a sunset gives you a gentle, soft feeling throughout Using contrasting colors with the same photo will give you a different look altogether. If you surround the same photo with lots of black, you create action and drama.

PAGE LAYOUTS

Now that you have looked at the principles and elements of good design, it is time to talk a little about the actually laying out the pages of that brochure, newspaper or retirement program. Page layout is the actual arrangement of type, photos, graphics, illustrations, etc. It involves the position of headings, the number of columns of text, borders, and the placement of graphics.

A good design makes it easy for your audience to receive the intended information. It requires elements to be arranged so they are aesthetically pleasing. There is no single correct formula for producing layouts or shortcuts to learning effective techniques. To be successful, the layout must stop readers and redirect their attention to the information you want them to read.

A good layout must be well organized and attractive to the reader to effectively communicate your message. A good layout succeeds when it gets the message across quickly.

The most important decisions you will make in creating your layout is deciding who is your target audience. You must also decide if the product is going to be printed or Web-based. How will it be distributed? If the product is going to be displayed on the Web only, you should use the RGB color mode rather than CMYK print color mode. (RGB = red, green, blue; CMYK = cyan, magenta, yellow, and key or black)

An Organized Layout

A good layout is organized when it provides a visual path for readers to follow. It shows the reader where to start and where to go second, third, fourth, etc. The better the organization, the faster the reader will get the message. Organization allows the reader to move smoothly and easily across the layout. If the viewer has to work at it, she will get bored or frustrated and lay the product aside.

Organization takes time and is perfected through trial and error. The process is similar to that of putting together a jigsaw puzzle. Best practice is to keep putting the pieces together in different ways until they fit together comfortably, emphasizing the items to the proper degrees.

An Attractive Layout

A good layout attracts your reader, grabbing her attention and pulling her into the information. A poorly designed layout fails to communicate. When designing and layout out your product, ask yourself these three questions:

- Does it work?
- Is it properly organized?
- Is it attractive?

If you can answer yes to all of these questions, you can say that you have a good layout. You should always get a second and third opinion, however.

PAGE ELEMENTS

Page elements, not to be confused with the elements of design, are the main ingredients that make up your layout. These include text, graphics, photos and illustrations, bleed, borders, rule lines, guidelines and grids, gutters, and margins.

Measurements

The system of measurement in graphic design includes the pica and the point. A point is defined as exactly 1/72 of an inch; therefore, there are 12 points in a pica and six picas to the inch. Type is always specified in points, and page elements are measured in points and picas.

TEXT, TYPE and COPY

Text, type and copy refer to the written information on your page. In the following paragraphs, we will discuss the factors to consider when working with text, type and copy.

Leading

Leading (pronounced led-ding) refers to the spacing between lines of text. It is measured in points, vertically from the baseline of a line of type from the baseline of the line below it. Leading is proportional to line length. Long lines of text require more spacing between lines. The default in most desktop publishing programs is usually 20-percent greater than the type size (e.g. for 10-point type, add two points to leading).

Closer text fits more text on a page, but decreases legibility. Looser leading spreads text out to fill a page and makes the document easier to read. Leading can also be negative. In this case, the lines of text are so close that they overlap or touch. Leading that is too tight makes it difficult for the reader to separate the words and phrases and to find the beginning of a line.

Line Length

Line length is the width of the line of type, column or page – in picas or points as set by the typographic commands. The length of a line depends upon the size of the type. Too long of lines

makes it harder for the reader to find the beginning of lines. Long lines make scanning difficult as well. Lines that are too short break up phrases. A good line length for optimal readability is 55-60 characters or nine to 10 words.

Kerning

Kerning refers to the horizontal space between letters. It can also mean to improve the appearance of type by adjusting the spacing between specific pairs of letters, such as AV, AY, FA, AW, PA and AT. Comfortable spacing between letters leads to visual balance, allowing the reader to move smoothly along the text. Kerning becomes more important as type size increases, as in large displays and headlines.

Type Size

As written above, text is measured in points with 72 points in an inch. Most documents use 10-point or 12-point type, or within the common range of 8 to 24 points. Small text is more difficult to read than larger text, but text that is too large becomes cumbersome and wastes paper and space.

Casing

Uppercase characters are capital letters; lowercase characters are small letters. The term casing traces its heritage to the days when typesetters kept capital letters in a tray above the lowercase letters.

Lowercase letters are easier to read than capital letters. Readers read quickly when they recognize the shapes of letters, and capital letters often appear to be in the same, square shape, vice lowercase letters. Writing with all caps adds emphasis, however.

Typeface

Typeface is the letters, numbers or symbols that make up a type that shares common characteristics, such as stroke width and the presence or absence of serifs. Although sometimes used interchangeably with font, they are not the same. Typeface is a set of one or more fonts, in one or more sizes. A font describes the style of typeface, such as bold or italic. For example, Times New Roman, Arial and Courier are the most common typefaces. Arial bold or Arial italic is a font.

Using different typefaces will not lead to better design or layout. It is best to stick to one or two typeface families throughout your layout. Choose a typeface that is simple and legible.

Typefaces can be divided into two categories – serif and sans serif. Serif letters are composed of thick and thin lines terminated with small cross strokes. One example of a serif typeface is Times New Roman. Serif is easier to read than sans serif, and serif improves readability by leading the eye along the line of type (see figure 5-4).

Figure 5-4, Example of serif letter and sans serif letter.

San-serif letters are constructed of strokes relatively even in weight. Arial is a sans-serif typeface. Sans serif is clean and simple in appearance. Sans serif is not recommended for large areas of solid text, but can be used in headlines and/or sub-headlines. For more information on headlines and captions, see chapter six of the first module.

Body Text

Body text is the main text used in your layout. It is the most important information the reader needs to know. Body text is generally 14 points or smaller and remains consistent throughout your publication. Italic or bold fonts should not be used for body text.

Pulled Quotes

A pulled quote is a short quotation that is pulled out of the story to attract attention and possibly entice the people to read the story. It also helps break up long columns of text. Pulled quotes are larger than body text, but smaller than the headline text, usually 18 to 24 points.

Indentations

Indentations are the positioning of text, so a margin of the line or lines appears a fixed distance from the left or right. Indentations affect visual configuration. The three basic types of indentations are regular, flush and hanging.

A first-line indent is an example of regular indentation and is often used to begin a new paragraph. Indents can be made from the left margin only or on the left and right, known as flush. The latter is used often to highlight a long quote or to bring attention to a particular passage. Hanging indents are frequently used for bibliographic entries, glossary terms, resumes, and outlines or bulleted lists.

Graphics and Photos

Every publication needs imagery to communicate concepts differently than words and to help sell the information. Graphics can be line drawings, art, digitized photographs or video images, or a combination of these. A photo adds visual interest to the layout. These are among the most important elements in the layout, because of their ability to capture a reader's attention without saying a word.

Bleed

A bleed is a photo or illustration that runs off a page or extends past the margin of the page. A full bleed means the printed elements extend beyond the four edges of a page.

Borders

A border is a decorative line or box used with text, graphics or tables. Borders keep it all organized and give the appearance that everything on the page goes together. Almost anything can form a border to a picture or a graphic. It may be as simple as a line around the edge of the page or a gold band to form a frame around another graphic.

Rules

Rule is another name for a line in graphic design. Rules are the horizontal or vertical lines used as decorative elements and as functional parts of the overall layout to separate, offset or anchor

areas of the page. They are used for forms, graphs and other graphic material. Lines divide and create organization.

Rule is a line of unvarying thickness, normally expressed in points, although some programs use inches by default. A hairline rule is the smallest. Rules can be solid or created from round, square or diamond-shaped dots. Rules can be made of dots and dashes in a pattern.

Guidelines and Grids

Guidelines and grids are used to align page elements. Gridlines help maintain consistency, determine orderly placement of text and graphics, and keep balance on the page. A grid is an invisible structure used to provide visual organization for text and graphics. A grid's influence may be evident in the width of columns, the uniformity of space around photographs, or the consistent placement of repeating elements from page to page.

Margins

As you read earlier, white space on a page is important to the layout's design, as it gives your layout breathing room. The most obvious white space on any page is found in the margins – top, bottom, left and right – or the empty space between the trim (where the page is cut) and the live printing area (primary text and graphics) of the page.

Traditional layout and design theory tells us that the more space devoted to margins in comparison with text and graphics leads to a more formal design and increases readability. Generous margins say elegance and simplicity. On the other hand, limited margins that leave little space can make your document look cheap, or mass produced. However, in today's cost-cutting, do-more-with-less business practices, skimpy margins are used more frequently and have become the norm.

Gutters

The inside margins or blank space between two facing pages in multiple-page document is known as the gutter. It is that extra space used to accommodate the binding in books and magazines. The amount of gutter needed varies depending on the binding method. The term gutter is sometimes used to describe the alley, as well, or space between columns of text in a page layout.

ELECTRONIC PRESENTATIONS

Another form of communicating the Navy's message is via projected media or electronic presentations, sometimes referred to as slide shows or command briefs. No matter the term, a presentation is a presentation anytime someone stands in front of several people and gives them information with support from projected information. An electronic presentation can also be viewed directly on a computer monitor in a personal setting.

In this section we will discuss how this multimedia product, like multiple-page layouts, pulls together more than one form of media – text, images, video, graphics, etc. – to best communicate your information. We will also speak about the other forms of projected media, which are not as widely used in today's digital environment.

The most important consideration when creating an electronic presentation is your audience. The presentation must convey information or educate your audience in some way. But each presentation is not created equally. For example, a briefing intended for your skipper will not necessarily be the same as one created for the crew. Nonetheless, the presentation must be professional.

The key to a successful presentation is organization. If the information you are presenting is not organized properly, the presentation will be ineffective. Successful organization can be achieved by following a simple five-step process.

FIVE-STEP PROCESS

Planning is the first step in developing a presentation. Planning begins when you sit down with your customer (or leadership) to discuss the target audience, desired outcome, content, specific multimedia requirements, and deadline. Always clarify any misunderstandings you have or the customer has before wrapping up the planning stage.

Design is the next phase of this process. After properly planning the job order, begin designing the look of the presentation. Work out the general layout and look at the presentation on paper first. From this roughest of drafts, develop thumbnails, roughs and comprehensive drawings to serve as blueprints for the final product. These blueprints should be shown to the customer prior to continuing on with the process. This will ensure that you are on the same page with your customer before you invest more time in the process.

Once the presentation is designed on paper and approved by the customer, the third step, production, begins. It is at time that you establish a files management directory for the presentation. A well-organized folder structure can reduce time spent searching the computer for necessary files. It also makes archiving the presentation easier for future recall. Within the folders, you should organize photos, graphics, videos, audio and text to be used in the presentation. You may want to keep an originals folder as well for back-up purposes.

Once the directory is established and source images digitized, it is time to create the presentation. Select the appropriate page setup for the presentation. Select a preformatted design template, or format the color scheme and masters manually. Once the slide master is formatted, create the slides. First, place all the content and then add supporting images. Add presentation effects such as transitions, animation and hyperlinks last.

After the presentation is complete, the next step is testing. Testing requires a quality-control check. To do this, proofread for accuracy and evaluate for effective design and legibility. It is also important to test the performance of the presentation by rehearsing on the system and in the exact location of the final presentation.

Delivery is the final step in the process. Once the quality-control check is complete, print viewgraphs, shoot slides, or save the electronic presentation in its final output format.

INFORMATION ARRANGEMENT

A good presentation includes an introduction, body, major points, summary and a closure. However, a presentation, depending on its purpose, can be structured in many ways. You could follow a pre-formatted template or you could design one unique to the presentation itself. When a pre-formatted template is selected, all slides within the presentation can be generated with placeholders that often include step-by-step instructions of what information to place when and where.

Navy presentations may not always be created using a pre-formatted template, but they do typically follow a general format. The first slide is the introduction or title slide, which is used as an opening for the speaker to introduce himself and the overall topic. The second slide contains the purpose or objective. This slide allows the speaker to discuss the reason or reasons for the presentation and to state the goals to be achieved. Next is the overview slide, listing the main topics

of discussion in the order each will be discussed. Slides specific to each topic follow. This is where you will most likely find graphics, audio, video and images to support the information being presented. This is where you can get the most creative.

After the topic slides comes the summary slide. The summary slide reiterates the topics discussed and allows the speaker to review the material covered. The final slide in the presentation is the closing slide. During this time, the speaker can review the objectives and open the floor to questions.

LAYOUT and DESIGN

Two of the most important factors when preparing a presentation are simplicity and legibility. Slides should not be a verbatim copy of what is being stated by the presenter. They should be used like headlines or signposts to point the direction of the presentation. Slides may also be used to illustrate and explain ideas the audience may find complex, for instance, the important elements of a table of figures may be better demonstrated if plotted as a graph. Research shows that each slide will only be looked at for approximately seven seconds, so remember to keep it simple.

Legibility is the "bottom line" and depends on a combination of factors. Font choice, text, colors, graphics, and layout all have an effect on the legibility of a slide.

Using Text Effectively

At any given point in time, the audience will have two senses with which to absorb a presentation – sight and sound. Don't overemphasize the importance of the spoken word; give equal importance to the slides. A good criterion for measuring the quality of slides is to go through them in sequence and ask whether the major themes are readily apparent with no spoken words. Similarly, a good criterion for measuring the quality of spoken words is to talk without any slides. These are harsh tests because neither the spoken word nor slides are adequate alone. If the spoken words and slides are both strong individually, all that remains is to be sure they are properly arranged.

Type

Type is the basic building block of a presentation. Often it is irresistibly compelling and sometimes absolutely imperative to design a presentation with more than one typeface in it. You may find more than one element on a slide such as a title, body text, labels, and image captions. Within these dynamics on the slide, a relationship is established that is concordant, conflicting, or contrasting.

Concordant – A concordant relationship occurs when only one type family is used. This keeps the slide harmonious, and the arrangement tends to appear quiet and rather sedate or formal. It is a good technique. To add more interest, however, you can use the regular style for one block of text and a bold italic for another.

Conflicting – A conflicting relationship occurs when separate typefaces that are similar in style, size and weight are used – such as Times New Roman and Garamond. The similarities are disturbing because the visual attractions are not the same, but neither are they different enough so as not to conflict with each other. Most often, conflicting text gives the appearance of a mistake rather than an effective difference between two elements.

Contrasting – A contrasting relationship occurs when you use separate typefaces that are clearly distinct, such as Impact and Helvetica. The visually appealing and exciting designs that attract your attention typically have a lot of contrast built in, and the contrasts are emphasized. Using two

contrasting typefaces in a presentation can add visual excitement. However, it is important that both of the contrasting typefaces are legible when projected onto the screen.

The choice of typeface used in a presentation has major impact on its legibility. The legibility of projected text differs from that of printed text, because the resolution of printed text is much higher than that of projected text. What looks good on paper may not project as nicely on the big screen.

Most experts recommend using sans-serif typefaces for electronic presentation. They believe that sans-serif typefaces hold up very well when projected and are easy to read, even from the back of a room. However, others argue that slab-serif fonts are also a good choice for electronic presentations, because they are more consistent in their thickness than other serif typefaces. Slab serifs can be identified by their thick, block-like serifs. Clarendon and Rockwell are examples of slab-serif typefaces. Whatever your choice, always check the readability when projected before the final presentation.

Text Size

Aside from using the right typeface, size also plays an important role in the legibility of text. Again, opinions vary on the perfect size for text on slides, but the consensus is to use text no smaller than 24-point for electronic presentations and 35mm slides. For overhead viewgraphs, the consensus is 18-point.

What matters most is the text must be easily read when projected on the screen. Before the final presentations, try one of the following methods to ensure you have chosen the right text size. First method is to display the slide full screen on the computer monitor, stand about nine feet away, and read the text. If it is easily read, the text is a good size. With a printed viewgraph, place the slide on the floor at your feet. If you can read the text without bending over, more than likely the text size is good.

General Text Guidelines

For consistency and simplicity, limit the amount of fonts used in a presentation to no more than two. In most cases, using a variation of the same font works very well, for example, Arial bold italic for the title and Arial bold for the body text. A second font can be introduced to highlight key points and phrases.

Remember the one thought, one paragraph idea introduced in newswriting? The same applies here – one topic, one slide. Focus on one point with each slide, and break up complex topics into smaller, more digestible segments. If there is too much information to fit on one slide, spread the information across multiple slides. This will give the audience time to absorb the information. Another good practice is to use bullet statements with each bullet representing a new thought about the main topic and use key phrases where possible. The concept of accuracy, brevity and clarity works well here; eliminate non-essential words, such as articles and other words not essential to your message.

A good rule of thumb to follow for placing text on a slide is the "6 x 6 rule", which means to use no more than six lines per slide, not including the title, and no more than six words per line. This does not mean there can't be more than six lines of text on a slide, because it is not always possible to condense the information that much. However, by keeping this rule in mind, it serves as a reminder to focus on the important words and eliminate any unnecessary words.

Use "Initial Capitals" when typing text rather than all capital letters. "Initial Capitals" is also known as sentence case or upper-lower case. Writing with ALL CAPITAL LETTERS makes the text hard to read and is the written equivalent of shouting. When learning to read, we learn by reading

uppercase and lowercase letters. Studies demonstrate we also read using shape recognition. Each letter has a distinct shape that is based on the construction of the letter. Likewise, so do words. We become very adept at quickly recognizing words without actually reading every letter.

Another tip is to keep all information within a safe area on the slides. The safe area, about ½ inch from the edge, compensates for any overlap or edge loss when projecting the slides.

Using Color Effectively

The primary purpose of color in a presentation is to create an attractive environment for the message. Studies show that a color presentation is more memorable and effective. The use of color can contribute to a presentation in several ways. Color choices can influence the mood and receptiveness of your audience. In a darkened room, audience attention can wander. Color provides the visual variety necessary to maintain audience interest. It can focus audience attention on a particular point in an individual slide. Finally, color can be used to enhance meaning and clarify information.

A presentation color palette establishes a consistent environment throughout. The color choices in a color palette can be broken down into three main areas – format, highlight and text.

Format Colors – Colors used in the basic design of a presentation are the format colors. These include the background colors and any colors used for recurring items, such as graphics and logos. When creating 35mm slides and electronic presentations, the format colors will usually be the darkest colors on a palette; on overhead transparencies, they will be a combination of dark and light colors, depending on the format design.

Highlight Colors – Highlight colors are those added to a palette for illustrations, chart and graph elements, text bullets, and other graphic objects that have meaning and content. These colors should fall in the midrange of brightness; bright enough to stand out from the background, but dark enough to support white or lightly colored text. Similar highlight colors are used for overhead transparencies, 35mm slides and electronic presentations.

Text Colors – Text colors include the basic text color, title and subtitle colors, and special colors for highlighting body text. In 35mm slides and electronic presentations, these colors should be the lightest in the palette so they will stand out against the format and highlight colors. On overhead transparencies with medium-light or light backgrounds, these will be the darkest colors.

Color Contrast

Color contrast is the relative difference between two adjacent colors. The difference may be in hue, as in red and green; it may be in saturation, as in light pink and primary red; or it may be in brightness, as in brick red and primary red. The difference may also be a combination of both, as in yellow and dark blue.

Contrast is defined in terms of foreground and background objects. In presentation design, text and graphics are the foreground objects that rest on the slide background color. High contrast is essential to readability and clarity in slide design, so it's important to select highlight colors for text and graphics that contrast strongly with the background. The best way to provide contrast is through a combination of brightness and hue.

When two objects with high color contrast, such as red and cyan, touch each other on a slide, a thin, white line may be seen where they touch. This effect is known as haloing. When two complementary colors touch, the slight overlap of the beam causes the colors to mix, creating a white

edge. Most haloing can be eliminated by placing a thin, black border around the complementary-colored objects, or giving the text a black drop shadow. The black line will interrupt the overlap.

Warm, Cool and Neutral Colors

Color can be divided into three main categories: warm, cool, and neutral. Warm colors are the colors of fire: reds, oranges, and yellows. Cool colors are those of water and air: greens, blues, and violets. The only truly neutral colors white, black and grays. However, subdued versions of warm and cool colors such as browns, tans, and slate blues, also serve as neutral colors since they usually have a lot of gray in them.

Warm colors draw attention in the presentation. Slides with a preponderance of warm colors stimulate the audience and cause feelings of heat and energy. However, warm, bright backgrounds are much too flashy for slides. The intensity of the colors will tire the audience. Dark reds and oranges can be used in backgrounds, but carefully, since it is difficult to find cool, contrasting colors that work well with them for foreground objects.

Cool colors have a more relaxing effect on an audience than warm colors. In general, slides with mostly cool colors make an audience more receptive and passive. Dark, cool colors are ideal for backgrounds because they contrast well with warm color highlights, forcing the audience to pay attention to the content rather than the background. Brighter cool colors can also be used, which would be overwhelmed by a warm background, as highlights.

True neutral colors act as a blank slate for the highlight colors used with them. Without an addition of some color (either with a logo or format graphics), neutral backgrounds can be very boring. Warm neutral colors, such as brown and tan, or cool neutral colors, such as blue gray, can be used to avoid the bland gray look. Neutral tones are the perfect background for a full range of highlight colors, both warm and cool. In a presentation, various combinations of warm, cool, and neutral colors can be used to influence the audience.

The background, because of its large area, will have a more profound effect on the general mood of an audience than the highlight colors used with it. Warm backgrounds are generally suitable for presentations that are intended to excite and stimulate the audience, such as sales and marketing meetings. Cool backgrounds are best suited to presentations that require the audience to be relaxed and receptive to information, such as business and scientific presentations. Neutral backgrounds (especially gray) serve as a backdrop for the other colors, so the highlight colors will have more effect on the audience.

Enhancing the Message with Color

In a presentation, anything that helps the audience concentrate on the speaker and the slides is a plus. Color is one of the strongest tools for guiding an audience. The following are some techniques for using color to enhance the message.

Use color to increase legibility – Strong contrast will increase readability. Unless deliberately trying to create a watermark effect, use enough contrast to create a visible edge where any object touches the background. Without proper color contrast, objects will appear weak and out of focus.

Use color to maintain audience attention – To keep the audience awake, use occasional splashes of color. Color visually stimulates the audience, keeping them alert and interested. Color also adds variety. Use colorful charts and graphs as well as colorful graphics and photographs to illustrate the point.

Use color to emphasize or de-emphasize points – Color can be used to call attention to a line of text or part of a graph, or it can be used to draw attention away from certain information. Large, low-contrast elements will seem less important than smaller, brighter ones. Instead of underlining important words within a text block, put them in a bright, contrasting color. Put the most important element in a bright color to direct the audience's attention to it. Use darker colors for data that is not as important to diminish its impact.

Use color to link related presentation elements – For example, if a briefing contains several references to different departments within your command, you can select a signature color for each department. The audience will identify with each color, and it will be easier to read and understand the slides.

Use gradient fills for depth and realism – Using gradient fills for backgrounds adds drama and depth to slides. It also enhances contrast between background and foreground elements.

Other Guidelines for Using Color

Limit the variety of colors used. Five colors are the maximum for graphs and charts. For word charts, limit yourself to two main colors with a third for highlighting.

- Use color to show relationships between elements
- Keep colors consistent
- Use bright colors to emphasize information
- Understand that cool colors recede to the background; warm colors advance to the foreground
- Use colors like blue and green for less important elements or large areas
- Establish a color palette and stick with it
- Avoid red-green combinations.

ELECTRONIC PRESENTATION PRINCIPLES of DESIGN

The four principles of design for electronic presentations are proximity, alignment, repetition and contrast.

The principle of proximity states that related items in a layout should be grouped closer together and unrelated items farther apart. When several items are in close proximity, they become one visual unit rather than several separate units. This helps with organization by reducing clutter.

Although elements are separated to indicate their relationships with other elements, alignment shows all elements in the layout belong to the same piece. Lack of alignment is probably the biggest cause of unpleasant-looking layouts. The principle of alignment states that nothing should be placed in the layout arbitrarily. Every element should have a visual connection with another element whether they are in close proximity or not. The purpose of alignment is to unify the layout.

Repetition strengthens unity. Color, shape, texture, spatial relationships, line thickness, fonts, text sizes, and text placement can all be repeated.

Often the most important visual attraction is contrast. The principle of contrast states that if two items are not the same, make them different, REALLY different.

Tables, Charts and Graphs

Most military presentations are based upon statistical data. So, you must be able to provide this statistical information through well-prepared graphics that communicate visually and can stand alone or be supplemented with written or spoken words. Therefore, you must be proficient in the basic techniques of producing tables, charts and graphs.

Tables

The two basic types of tables are general purpose and special purpose. Although their construction is the same, there are basic differences.

General purpose tables present a broad range of data on a specific subject, while special purpose tables highlight a particular aspect of a study.

General purpose tables are quite long and cumbersome; special purpose tables are usually brief and to the point.

A table should contain a title, body, captions, footnotes and source and preparation data.

Title – tells the viewer what is being compared and where and when the data applies. Never sacrifice clarity for brevity when deciding upon your title.

Body – the information should be presented simply and clearly, so it must be arranged systematically to emphasize the important points. Columns are vertical listings, and rows are horizontal. Column headings are called boxheads, and row headings are stubs.

Captions – Captions are related to the title of the table. Detailed captions eliminate the possibility of misunderstanding. Captions give unit of measurement being used. These captions, although different from photo captions, do explain what is in a table.

Boxheads contain caption information for vertical columns

Stubs contain information in horizontal rows. They are usually listed in some logical order – numerical, alphabetical and geographical. Stubs should be clear and complete to prevent misunderstanding.

Footnotes – Clarify items that are not completely self-explanatory. To draw attention to a footnote, use an asterisk or some other graphic symbol, but don't use the same one for different footnotes. Footnotes should be placed to the left, directly below the body of the table.

Source and Preparation Data – To be complete and effective, you must include the source of the data, the preparer's identifying information, and the date the table was prepared. It is standard to display this information in the lower left and right corners of the table, aligned vertically.

Tables do not have standard graphic elements, like you may find in charts and graphics. Therefore, an effective table relies on good information and line-width hierarchy. Text hierarchy means that separate groups of text have different characteristics. For example, the title should be the largest and boldest text in the table. This draws attention to the important elements and assists in visually organizing the information. Line-width hierarchy means using different line widths or styles to separate components.

Charts and Graphs

Well-constructed charts and graphs make for effective statistical data presentation. The possible variations in design are endless, limited only by your imagination. The value of a good chart or graph lies in the statistic that we take in 75 percent of all information through sight.

Overcrowding, however, in charts and graphs obscures information and defeats the purpose of your graphic to display information quickly and simply. Information contained in a graph or chart must be accurate, timely and clear. These graphics help audiences reach conclusions.

Major components of charts and graphs include a title, scale (range of values), items being charted, legend, and source and preparation data.

Title – Same rules apply as in tables. It gives the audience the what, where and when.

Scale – The scale, or range of values, is usually listed on the left side of the chart or graph and shows the unit of measurement and numbers. The scale caption is derived from the title and must be shown. It is usually centered above or to the left of the scale.

Most scales start at zero and extend to the highest needed value.

If a scale does not start at zero, it gives a false impression, misleading the viewer.

The interval of value is also important. You should select an interval that makes the information appear clear and uncluttered. Usually the smallest value determines the interval.

Items being charted – These items are usually listed along the bottom of the chart or graph. The name of each is centered immediately below the line or space where its value is plotted.

Legend – The legend identifies the data plotted. The more types or trends of data, the more essential the legend. In the legend block, each type or trend of data is associated with a distinguishing mark – line or color. Generally, the legend is placed in the lower right corner

Source data – The source of the information is placed in the lower left corner of the chart as in a table. The source is essential, because without it, the chart loses validity.

Preparation information – The preparation data shows the data and the agency that request the chart in the lower right-hand corner of the chart.

Charts and graphs may be designed in several different ways; however, there are some basic charts from which all other charts are derived. These are the bar graph, pie graph, line graph, flow chart, and organizational chart.

OTHER FORMS of PROJECTED MEDIA

In addition to electronic presentations, other forms of projected media include overhead viewgraphs and 35mm slides. An overhead viewgraph is more commonly known as a transparency.

An overhead viewgraph, which is typically 11 x 8.5 inches, is projected onto a screen using an overhead projector. It is projected with the same ratio as a television or computer monitor – 4:3. When creating a viewgraph using today's most-popular software, the default size is 10 x 7.5. This size uses an aspect ratio of 4:3, where 2.5 inches is the unit of measurement.

Transparency film for copiers and printers is not very durable and is damaged easily. To prevent damage during handling, you should place it inside a document projector or mount it.

The quality of a viewgraph depends upon the resolution of the image and the resolution quality of the printer. The resolution of the image (number of pixels per inch) determines the smoothness of the printed or projected image. The resolution of a computer-generated image and a data projector is based on picture elements or pixels. Monitor resolution is 72 pixels per inch (ppi). Dots per inch, or dpi, determine the resolution of a printer and refer to the number of dots the printer is able to reproduce within an inch.

The more pixels an image has the smoother or detailed the printed image will appear. The higher the dpi of a printer, the greater the concentration of dots printed and the smoother the printed will appear. Most laser printer typically print at 300 to 600 dpi. When developing images for presentation, you should use 150- to 200-ppi resolution that will be printed to a transparency film for the overhead viewgraph.

Overhead projectors, once popular in classrooms and business conference rooms, have mostly been replaced by data projectors. Data projectors take images from a computer and display them directly onto a wall or big screen.

Data projectors are one of two types, portable or fixed. Portable projectors are generally smaller, less expensive, weigh less and are not as bright as fixed ones. They range from three to 20 pounds and cost between \$550 and \$6,000. Some portable projectors are small enough to fit in the palm of your hand. Fixed projectors are just that, fixed or mounted in a conference or presentation room. They typically weigh between 13 and 30 pounds and can cost anywhere from \$1,000 to \$25,000. The additional cost does mean increased quality in most cases. These projectors have at least 2,000 lumens, which mean these projectors can be used in a moderately bright room.

MULTIMEDIA AUTHORING AND ANIMATION

Some presentations created today take multimedia to a new dimension by providing a means of interaction between the viewer and the production. This process is known as authoring a movie and involves many stages. Movie is the authoring term for a project and will be used often in this section.

The authoring process takes a development team through multiple stages and builds a working prototype to demonstrate how a movie will work.

STAGES of AUTHORING a MOVIE

Movies are created in many stages. Most often these development stages are very specific. At times it may be hard to see any separation of the stages, but you should never leave any stage out. There are six general stages for authoring a movie, starting with the concept and finishing with the distribution and delivery. As you go through the stages, you may find yourself going back to certain stages to reevaluate certain aspects or to make decisions based on other stages.

Concept

The concept stage is sometimes referred to as the question-and-answer stage. When creating a movie, the three most important aspects to keep in mind are the target audience, the purpose of the product and the product itself. Before you create a movie, you need an idea and an audience.

You must also ask yourself about the comprehension level of your target audience, the purpose of the presentation (inform, entertain or educate), the format of the end product, and the desired delivery method.

Planning

Before you begin working on the movie, you have to know what you have to work with and when your customer wants the project completed. You must also consider your budget, your manpower, and your equipment (hardware, software, etc.). The next step in planning is to gather your content.

Organization and development are important elements of the planning stage and are keys to the success of the movie. During planning, you should also identify your topic, develop a story line, write a script and create a storyboard, most likely in that order.

A script is the written organization that details the scenes of your production. It should contain the who, what, when and where aspects of your planning. Script writing is similar to writing the story of your production and leads you right into the design stage.

Design

This stage begins with brainstorming; put everything you can think of for the design of your production on paper first. A detailed design plan needs to show what and where text, still images, sounds, animations, and video clips will be placed. A house or high-tech fighter plane would not be built without blueprints. The same goes for multimedia. The design work is not just for your benefit but also for your customers. By working with the customer with the blueprint, you can avoid issues later, because the customer can see ahead of time what his product will look like.

One of the best things you can do for your multimedia program is provide yourself with a script before you begin. A script for multimedia is typically set up to provide not only the dialogue or narration, but also the action, sound and music that is to take place at the same time. The scripting processing continues as the design team creates thumbnails, comprehensives (scamps), and storyboards, for every scene and prepares flowcharts of all the interactive connections in the movie.

Thumbnails are small, quick sketches used to work out general layout and structure within each scene. You can use a template or sketch thumbnails alongside the script. Both practices are common.

Scamps, or comprehensives, are pencil layouts of every scene that shows how the text and images will be positioned. People are going to be working from these plans, so they need to be descriptive and accurate.

Flowcharts organize the content. An informational flowchart is presented as a box diagram, with lines that show the access routes among its parts, a navigational blueprint. It shows how you plan to take the user through the movie. The flowchart shows links between scenes. The ideal flowchart is a clear, easy-to-follow specification of a program's topic categories, levels, and links.

Storyboards look like comic strips and are similar to scamps only with a lot more information to show how the elements appear in each scene. Storyboards list all actions and options of each scene, such as animation, moveable objects, audio, video, proposed interface, and navigational tools. Storyboards do not have to be elaborate, but they must show progression. Storyboards give everyone associated with the project a chance to share and understand the visual concept the director and writer are after. If a scene works on paper, chances are it will work in the program.

The best multimedia designs are transparent to the user. They create an environment where the user forgets he is relating to a machine and feels motivated to explore. Good design calls attention to the content of the production, rather than calling attention to itself. Screens and graphics will appear to have a texture that can be revealed by dramatic lighting effects. Colors should be harmonious. The movement through the program will feel comfortable, and users will easily learn how to work their way through the program.

Production

The production stage combines the planning and design efforts into an electronic media. Production includes recording, obtaining and creating images, sounds, and video, then saving these as source files to be used by all members of the team. Decisions are made on file names, formats and file structure for these source files. Good organization maximizes production time.

During production, you should also be visualizing final product, so most likely you will have to refer back to the concept stage. This will help you determine screen size, image sizes and possibly the frames per second (fps) rate of videos. Most movies will be made for show on a video or computer screen. With this in mind, you will more than likely make the screen 640x480 pixels and images no larger than 640x480 pixels at 72ppi. Videos run at 15 to 30fps. While the movie is being brought together, testing must be done to make sure it matches the designs and functions properly.

Testing

Testing is a never-ending, continuous process done throughout the development of the movie. All decisions should be tested and checked whether they are on paper or in the program. Proofreading the script, scamps and storyboards will help prevent embarrassing moments later. In the concept stage, you should have identified the target audience and system to be used for the movie. It is imperative that during the testing phase that you test your product with members from the target audience and on the target system to ensure you are reaching your mark.

A popular testing method is to use an independent, third-party tester. You give the tester a finished prototype and basic instructions. From this, the user should be able to understand and navigate through the movie. Third-party testers are usually used to find bugs missed during production. If testing is successful, it is time to move to the final stage – distribution and delivery.

Distribution/Delivery

Distribution, and/or delivery, of the product should be done only after the movie has been tested and all glitches fixed. Once the movie is generated, it will be distributed onto some type of media – compact disc or DVD, server or website.

CD-ROM (compact disc read only memory) – small optical disc made of plastic that stores up to 700 megabytes (MBs) of information.

DVD-ROM (digital versatile disk-read only memory) – a disc with a capacity of up to 25-times greater than that of a CD and offers digital-quality images for superior multimedia processing. DVDs store more than four gigabytes (GBs) of information. Following these steps will help you save time and money.

Key here is ensuring that the product you created is compatible for distribution.

INTERACTIVE MULTIMEDIA

Multimedia is typically divided into two categories, linear and nonlinear. Linear productions progress without any navigational control by the viewer, such as a cinema presentation. Linear follows a sequence of a line, starting at a beginning and running through to an end without jumping around. Nonlinear productions and presentations give the viewer or user navigational control, such as in a computer game or computer-based training. In other words, nonlinear multimedia is interactive.

Interactive media, like other forms of multimedia, integrates electronic text, graphics, video, sound, etc., into a structured digital environment that allows its audience to interact with the data. Authoring software is capable of providing the links that join these elements and make a multimedia movie interactive. The digital environment includes, but is not limited to, the Internet, telecommunication and interactive digital television.

There are four categories of interactive programs – presentations, catalogs, games and computer-based training. Your information, audience and project goals help determine the most appropriate design model.

Presentations – An interactive presentation is like show and tell, through which you have a story to tell or a message to convey. These presentations can be learning experiences for the viewer. To ensure the material is absorbed and the viewer is motivated to retain the information, the presentation must be memorable, entertaining, and most importantly easy to navigate.

Catalogs – Catalogs are used for direct access to information. Without leaving the home screen, the viewer can typically navigate through the presentation. Interactive catalogs employ a search engine and a transaction component. The search engine enables the user to access information from a text field or hypertext-linked index. The transaction component provides the user with the tool to actually select (and purchase) items.

Computer-based training – Computer-based training (CBT) includes any application that provides the user with a specific learning agenda. Information is absorbed by the user at her own pace, which allows her to advance through the presentation as she retrieves the information and qualifies it at each level. The two distinguishing characteristics of CBTs are simulation of real-life events and scoring. The ability to simulate real-life events is one thing that makes computer-based training so valuable. True CBT programs will include the ability to record user responses and measure user progress.

Computer games – Computer games are the foundation for most, if not all, of today's multimedia industry. The objective for computer games is to make the game more challenging as you progress through it and become more proficient.

Hypermedia is an example of nonlinear multimedia. It provides a structure of linked elements through which the user can navigate. The World Wide Web is an example of hypermedia, where hyperlinks help the user move from one website to another.

To navigate through a production means to move through the piece using interactive connections, comparable to a road map, blueprints. The user has selection options, buttons to click, such as a "next" button or an arrow.

Understanding the terms we associate with authoring will lend a better understanding to the principles of animation

PRINCIPLES OF ANIMATION

Animation is a series of graphic images that are displayed fast enough to trick our eyes into believing there is movement. If done well, animation can add a great deal to the movie. If it is improperly done or if there is too much animation on a single page, it can be distracting and annoying.

Animation is often a better choice than video in education and training, because animation can be used to simplify complex concepts. Animation is good for showing changes over time, transitions and transformations of elements, and relationships among objects. The movies we see in theaters and on television are just sequences of still pictures seen in rapid succession. Because the changes are relatively small, going from one picture to the next, we perceive motion. Essentially, animations are created by changing an arrangement ever so slightly from one frame to the next.

Cell Animation

The very first filmed animations were drawn – and filmed – frame by frame. This meant that an artist had to draw thousands of pictures even for a short film. Consequently, drawings in the earliest cartoons are generally not very sophisticated. Cell animation, also known as frame animation, was created in the early 20th century, making it possible to create feature-length animations.

With cell animation, a scene is divided into layers. Characters and props are painted onto clear acetate cells, which are laid over background paintings on an animation stand. A single background painting may appear for several seconds in a scene. Then, only the characters need to be redrawn from one frame to the next.

Time and money can be saved, however, by having multiple cells for the characters and props, separating the parts that change rapidly from those that don't. Also, cells can be reused as backgrounds and sequences (e.g. a "walk" sequence). Although cell animation reduces the amount of drawing needed, it also complicates the filming process — each frame is now an arrangement of pictures. To minimize the confusion that might arise, timing sheets keep track of the animation stand, the camera movements and the corresponding audio.

Key frames and Tweening

Some animators draw a sequence of pictures and have the resulting motion look the way they want. More often, an animator will first draw the frames showing key points in the action (key frames) and then draw the frames that make the transition from one key frame to the next (in-betweens). In large productions, the more senior animators draw the key frames, and then have others draw the in-betweens. Software available today can do some of this tweening for you. If your key frames show an object in different positions, or at different sizes, you can fill in all of the in-between stages. Tweening is the process of filling in the frames between the key frames to make the animation appear fluid.

Morphing

Morphing is a technique used with frames to create the illusion of one object changing into another. Morphing is generally created using a process referred to as shape tweening. Key frames are set and the computer generates the between frames. By displaying a series of frames that create a smooth transition, it appears that one shape actually becomes another. Although tweening and morphing are time consuming when done manually, creating frame-based animation is actually simple with a computer and animation software.

Other Types of Animation

Path-based animation is also known as vector animation. This type of animation creates animated objects by following an object's transition over a line or vector path. It tracks the beginning, direction and length that an object travels. The path the line takes can be straight or curved and can be drawn on a path.

Script-based animation uses programming languages to create animation. By using a set of program commands, frames can be substituted for other frames, thereby creating a sequence of movement or animation.

Constraints of Animation

Despite the great flexibility computer animation gives us, the medium does impose some constraints. Being aware of these constraints will help you to plan better animations.

When you zoom in on a raster image, each pixel in the image is mapped to several pixels on the screen. Because of this, the image will start to look like it's made up of little boxes. When you zoom out, only some of the image pixels get mapped to the display. Details can and do get lost.

A raster image is a fine grid that stores exactly one pure color for each grid square (or pixel) in the image. The computer displays a raster image by mapping image pixels to display pixels; that is, the color of a pixel on the screen corresponds to the color of one of the pixels in the image. A raster image contains no information about the object(s) that the picture represents.

Knowing the terminology and principles and becoming familiar with the authoring software in your shop are the first steps in becoming an effective multimedia illustrator. From there you will be well equipped to develop and create movies, training videos, and incorporate animation to your projects.

WEBSITES

The Internet and more specifically the World Wide Web have become so intertwined into our everyday lives that many cannot remember what life was like without it. However, to fully appreciate the power and complexity of the Internet one has to look at its humble beginnings.

During the Cold War in the mid-1960s, the need for a decentralized communications system was apparent. A concept to connect computers together throughout the country that didn't rely on a single route between two points was devised. This system was known as a "packet switching network", where data would be broken into "packets" and routed through the network on whichever path was available at the time of transmission. A packet is a unit of data which has been formatted for transmission over a packet switching network. With such a system in place, communication could take place in spite of parts of the network being unavailable.

Originally implemented for the government and a few universities, the Internet was an emergency military communications system operated by the Department of Defense's Advanced Research Project Agency (ARPA) and used for research in education and defense. This operation was referred to as ARPANET.

Over time, every U.S. university that received defense-related funding possessed ARPANET computers. Gradually, the Internet transformed from government purposes to a communications tool for scientists. As more scholars came online, the administration of the system transferred from ARPA to the National Science Foundation.

In the late 1980s, businesses began using the Internet and the administrative responsibilities were once again transferred. During this time, the foundation of the Internet was being expanded as the military and the corporate world upgraded their computers and networks to grow with the demand of new users. This infrastructure has grown from a few computers into literally millions of computers connected together using cables, phone lines, and even satellites to cover almost the entire Earth.

To communicate between locations through this large network, computers use a communication protocol known as IP (Internet protocol). This protocol, running on each computer connected to the Internet, ensures that communication breakdowns do not occur and the networked computers can communicate with each other and exchange data properly.

Every computer connected to the Internet has a unique IP address. If a duplicate IP address exists, an error is given to the computer using the same IP. To exchange computer information over the Internet, a computer protocol known as transmission control protocol Internet protocol (TCP/IP) prepares the data to be sent and received. TCP/IP ensures that a Windows™ network can exchange data with a Unix™ or Macintosh™ network and vice-versa.

Unlike telephones that exchange analog signals with a direct electrical connection, computers communicate by breaking the data into separate data packets. These packets are passed off to different computers and network routers across the Internet until the data arrives at the destination. Some of these data packets arrive to the browser at different times. The TCP/IP protocol reassembles the packets into data that Web browsers display as a complete Web page.

It is important to understand the difference between Internet and the World Wide Web. The Internet is the physical network made of smaller networks made by the connecting of computers on those networks. The World Wide Web (WWW) is a system for organizing data over a network. The WWW is the system that we use to communicate, publish content and share digital media on Internet.

The U.S. government controls the Internet's "root" — the master file that lists what top-level domains are authorized to operate on Internet. There are plans to transfer this responsibility to the Internet Corporation for Assigned Names and Numbers, or ICANN, which would be governed by an international community. Currently, there is much argument over whether a change in responsibility over Internet would be beneficial to the world or not, because of the many technical and cultural challenges this transfer has been delayed.

Unlike the Internet, no one entity is in control of the World Wide Web. Because the World Wide Web is considered open to the public, many developers can develop for, and utilize the web to publish content. What we usually pay for is the physical connection to the World Wide Web, any services we might subscribe to that reside on the WWW, or storage space we require online.

All laws pertaining to the World Wide Web and how content is governed are handled by local governments and authority over content for the web is handled geographically. For example, in Arabic countries, content is more strictly controlled and many western websites are not available to their citizens.

The future of the World Wide Web continues to brighten with every innovation. If you wish to know more about the World Wide Web and the guidelines for operating on the Web, click [HERE](#).

The ease of access to Internet and the World Wide Web has changed the way we use and exchange information. We can now keep up with the news, weather, and stocks with just a click of the mouse or an app on our cell phones.

Web 2.0

Web 2.0 changed the way users and designers use the Web. Web 2.0 sites let users to interact and collaborate with one another socially and professionally through user-generated content. This differs from static websites in that the viewer can do more than just browse through the content, which is created and controlled by the sites webmaster. Examples of Web 2.0 include social networking sites, blogs, wikis and video-sharing sites.

WEBSITE ESSENTIALS and TERMS

For Navy public affairs and visual information professionals, the Internet has become a vital part of our communication strategy. Through static websites, interactive websites and social media, the Internet now ranks up there with television, print productions and radio for telling the Navy's story. Although MCs use commercial social media sites on the Web, static websites are typically designed, created and maintained in-house.

Before you can design or administer a website; however, it is important to learn the concepts, terms and procedures used to create and maintain websites.

Governing Instruction

The governing instruction for website maintenance and development is [SECNAV Instruction 5724.47](#) (series), Department of the Navy Policy for Content of Publicly Accessible World Wide Web Sites. And, according to this instruction, the management, including oversight, of all content on official, publically facing Navy websites is a public affairs function.

So, before jumping in to create your command's website, it is imperative that you familiarize yourself with this instruction as well as all others pertaining to military webmasters. Policies for Web and other Internet-based capabilities (ibC) can be found on the [DoD webmaster page](#).

Web Browsers

A web browser is a client software program that resides on the computer you use to view pages and navigate through the World Wide Web. When you request a page on a website, your browser connects with a web server. The browser processes Web pages from the serve and displays the pages for you. Depending on your browser's features, you might be able to view or interact with multimedia files, read e-mail, shop online, or use other advanced features.

Browsers used today, such as Internet Explorer™, Mozilla Firefox™, and Safari™, display Web pages differently. As a designer, you must be aware of how different browsers behave by testing different sites and your own site on them.

Internet Service Provider

An Internet Service Provider (ISP) maintains the server where your computer sends requests as well as the space required to store your Web pages.

Web Server

Content available on the Internet is stored on Web servers. When you make a request from a Web server, an IP connection is made across the Internet between the client making the request and the host running the Web-server software. As soon as the Web server satisfies a request, the Internet connection between the client and the host breaks. A page containing images or links to other pages

all require separate connections. Often, it takes many requests to retrieve all the information on one Web page.

Uniform Resource Locator (URL)

Every piece of information on the Web has a unique address. This address is called a Uniform Resource Locator, or URL. A URL is an address that reflects the location of a file on Internet. This information might include a Web document, a file on a file-transfer site, or an e-mail address. A URL is made up of several parts (see figure 5-5):

- Protocol tells you how you are going to get to the information, such as with HTTP, HTTPS or FTP (file transfer protocol)
- The domain is the Internet host name, or the textual identifier, of the site
- The directory path is the place, or folder, within the site to locate the requested information
- The page name is the file name of the page you're requesting.

Figure 5-5, Example of Uniform Resource Locator (URL)

Domain Name Server (DNS)

The DNS system forms one of the largest and most active distributed databases on the planet.

When you use the Web or send an e-mail message, you use a domain name to do it. For example, the URL "http://www.navy.mil" contains the domain name "navy.mil", so does the e-mail address user@navy.mil.

Names like "navy.mil" are easy for people to remember. This isn't true for machines. For all computers connected to the Internet, an IP address is assigned to refer to that unique machine. For example, the machine that people refer to as "www.navy.mil" has the IP address 207.114.197.94. Every time you use the domain name, you use the DNS to translate the domain name into the machine-readable IP address.

New processes are being developed to keep up with the demand for needed URLs, as current methods cannot handle the number of required URLs.

ELEMENTS OF A WEBSITE

The Web is based on a set of rules for exchanging text, images, sound, video, and other multimedia files. The set of rules is known as the hypertext transfer protocol, or HTTP. Web pages are exchanged over the Internet because browsers and Web servers both understand HTTP.

A Web page is any page you see when you open the Internet. Every new screen you click on is a Web page. A website is a collection of Web pages. It can be made up of one page or millions.

A homepage is the starting point for your website. It is similar to a title page or a table of contents for a written document and it is the most common access point for the website. It also contains hyperlinks to subsequent pages within the site.

Within your website, you can also include a site map as a guide to the different pages through which your viewers can surf to find information. To view an example, check out the [site map](#) for the Navy Personnel Command's website. Typically, site maps display items hierarchically, breaking down the website's information into increasingly specific subject areas.

A website may also contain downloadable documents, images, video, text and more; you are limited only by your imagination (and regulations as to what can and cannot be posted).

HTML

Hypertext Markup Language (HTML) is a special language used by Web designers to format Web pages. HTML consists of a series of simple-to-learn tags that indicate page elements, structure, formatting, links, and more. Web browsers read these HTML tags and format the text and styles that appear on the viewer's computer screen. Tags are enclosed by the lesser than (<) and greater than (>) brackets and may be written in capital or lower case letters. (NOTE: An emerging alternative use of the term "tag" is to describe the classification of content by readers used with photos, blogs, etc.)

<pre><html> <head> <title>Your Page Title</title> </head> <body></pre>
<p><i>This area will contain everything that will be visible through a web browser, such as text and graphics. All of the information will be HTML coded.</i></p>
<pre></body> </html></pre>

Figure 5-6, Three main sections of HTML.

A Web page is made up of three main sections of HTML, each defined by a tag (see figure 5-6). The first is the html section. This area is defined by <html></html> tags. Everything between these tags is considered part of the Web page. The second section is the head section, found between <head></head>. In addition to the title of your page, you will also find keywords, page description information, special elements like cascading style sheets (CSS), and other information required to make the page display correctly. The last section is the body. This is where you will place items, or content, that will be seen by the viewer.

[DINFOS training](#) as well as online tutorials are available to help you grow your Web design skills, such as HTML coding. It is imperative that you stay up to date on current trends in Web design.

Plug-ins are software modules that add specific features or services to a larger system. HTML, although it does what it does well, does not have the innate ability to display a movie file or run a

video game. Plug-ins increase HTML's functionality. They are invisible to the user and are called upon whenever an element needs one. On the down side, plug-ins require you to work outside standard HTML and not everyone has access to the same plug-ins. Some of the most popular plug-ins are Adobe's Flash™ and Shockwave™, Apple's Quick-Time player™, and ActiveX™.

Cascading Style Sheets (CSS) is a style language used to describe how content appears on a screen. Content is the information you want to communicate to your user. Content comes in many forms – text, images, videos, and sound. CSS separates your content from the structure rules for how it will be displayed. Structure elements, for example, can dictate what color the text appears, where on the page and image is placed, or whether or not a border is displayed.

CREATING WEB PAGES

Your options for creating Web pages differ greatly from those for the printed page. If you design pages using HTML, you don't have complete control over how the reader receives the page, the size of the page, the width of the text column, the fonts, or size of text.

For this reason, you can use WYSIWYG Web-authoring tools vice HTML coding. WYSIWYG stands for "what you see is what you get." WYSIWYG editors have graphical interfaces that make writing HTML more like using a word processing or page layout program.

In the beginning, the goal of WYSIWYG authoring tools was to spare authors from ever having to touch an HTML tag. Today, their role has shifted toward making document production more efficient and automated while still providing access to the HTML source. An editor can help keep track of page links, images, files and folders and make sure all required files make it to the Web server when it's time to upload.

Having a WYSIWYG editor does not eliminate the need to understand how HTML or CSS works, but it does remove some of the pressure of memorizing large amounts of tags or rules. A good WYSIWYG editor should be able to write W3C (World Wide Web Consortium) standards compliant code and include software tools to assist in writing handicap-accessible sites.

Even though you don't have to enter the HTML tags to create your Web page with a WYSIWYG editor, you still need to know a few things about the capabilities of HTML and how they control what you can present on your page.

Stages of Web Creation

The process of developing a website is no different than developing any type of media project. Many of different elements and resources need to be determined throughout the project. Each stage of authoring helps the authoring team to properly accomplish long term goals. Let's take a look at the different stages of authoring — concept, planning, design, production, testing, and distribution/delivery.

Concept

Like other multimedia projects, you have to have an idea or concept in mind before you begin developing a website. You must also consider your customer, your audience and the purpose of the site. Will the site be for informational purposes only, or will it be used to educate or entertain?

Planning

After you have an idea, a purpose, and you know your target audience. You must plan, schedule, and account for any resources, before you can begin the design phase. You must also know when your customer wants the project completed.

Design

You have probably heard the phrase, "It's not finished until the paperwork is done." In website production, "You haven't begun until the paperwork is done." is more true. Before you begin full production and begin putting things together in your website, it all needs to be on paper first. Most websites start with drawings, such as with storyboards in multimedia authoring and videography.

Web designers also use flowcharts when putting together sites. A flowchart is the navigational control to your website, and it is the plan of how you will take the customer through the website. Most flowcharts start by placing the scamps (small images that represent the content) into an organizational chart like pattern. The flowchart is then used to organize content and show the links between screens in your title. When creating the interface and navigational controls, you must again look at the concept stage and keep the user in mind.

The interface design and controls should be intuitive, or feel natural, simple and consistent. . Another consideration in the design phase is style. Consider how colors, photos, illustrations and backgrounds will be used. Color and shape have a lasting effect on the end user and are often overlooked. The design work you do now not only benefits you, but also benefits your customers as well. . Remember, your customer is the final decision maker. At this point, if the design isn't right, you have only exchanged paper.

Production

With the design work accepted and the concept in full view, it is time to begin production. The production stage is where the pieces of the site begin to come together. Each person on the production team begins to gather raw files and prepare them for production. The source files are brought together and placed where they can be used by all members of the team. The obtaining, and creating of images, sounds or even video will continue throughout the production phase. It is in this stage, as you recall, where you also build your file structure to best organize your items.

Testing

Testing, as with all multimedia products, is vital to a website. Testing can happen at any point along the stages of authoring. Testing websites can be a challenge, since you have to test on a wide variety of machines and browsers. Always test your site in more than one browser, and on more than one computer – newer computers and older models as well as computers that run on different operating systems. It is also important to have someone unrelated to your project team test your site. One bad link can ruin a user's experience with your site and reduce the effectiveness of your site.

Other items to consider when testing your website:

Logical appearance – Does the site communicate its purpose well? Can I tell what this site is about at first glance?

Ease of navigation – Does the site navigate logically? Is the content on the site broken up logically? Are the subpages (links) retrieved with ease?

Broken links – When you click does it go where you thought it should? Do documents, images and/or videos load properly?

Too much or too little information on a single page – Is the page too crowded? Is there too much dead space?

Usability issues – Any and all usability issues should be looked at and corrected as early as possible. Test, test, test your site.

Distribution/Delivery

When you have completed all other processes and your customer has reviewed and approved the site, you go live with the site and begin advertising it. Remember, you must ensure you have read all required policies and instructions to ensure you are compliant. It is most likely that your client (leadership) will be unaware of these regulations, so it is in your best interest to have such knowledge.

Layout and Design

An HTML page is one column of continuous text with graphics that flow along with the text, as if they were text characters themselves. This text-stream model limits control over page layout; for example, it controls how you can set up layouts that use multiple columns, layered text and graphics, or rotated text. The text model means page proportions and line breaks will vary depending on size of the monitor or window in which the page is viewed, and the preferences set in a Web browser. As a rough guideline, you might design for the line length produced by a Web browser using a default font on a 640-480 pixels screen.

Using HTML, you cannot specify a precise horizontal and vertical position for a graphic. For example, if you position a graphic at the bottom right of a page as it appears on your monitor and a reader decides to make the window narrower, the graphic probably will move to the next line down and may end up on the left side of the page. The only way to constrain a layout is to place everything into tables. You can also use WYSIWYG — authoring software.

As for deciding where to put the information, it is best to follow the same principles you would use when creating multiple page layouts (see above). However, there are some elements that are specific to Web design.

Text

When placing text on your website, you should refer back to the do's and don'ts for page layouts and electronic presentations, previously mentioned in this chapter. These rules have been refined for years, and they work well. It is also important to consider placement of text. Centered text is hard to read. Left-justified text, where text is lined up on the left side of a page, is the best practice. Titles and similar elements can be centered, however, to show emphasis.

Other tips for using text include ...

- Use uppercase and lowercase letters, vice ALL CAPS, except with titles or items you are trying to emphasize
- Italics should only be used to draw attention to text. Overuse makes text hard to read
- Overuse of bold text minimizes its affect, and like italics, decreases legibility

- Keep terminology simple and easy to understand. Remember your audience.

Graphics

When you're considering what images to include, keep in mind that images take longer to download than text. Some browsers don't display graphics at all, and some readers turn off graphics to speed up their browsing. You should also keep image file sizes as small as possible by reducing the image size and the number of colors (the color palette) of the images.

You want your homepage to load very quickly, so no graphic should be so large it takes a long time to download. In Web design always be aware of your download speeds. Be sure to resample or reduce the image resolution in an image-editing application. Scaling an image in a WYSISWYG editor does not change its file size and won't speed downloading. You can use an image-editing application to resize or resample high-resolution images. A resolution of 72 pixels per inch is high enough for most images, because it is the resolution of most Web users' monitors. Ensure you use a compression method and save in the graphic in the correct file format.

Data compression is storing information in a format that requires less space than usual. Data compression is particularly useful in communication because it enables devices to transmit the same amount of data in fewer bits. It is important to consider what images to include in a Web page. It is imperative to learn how to correctly compress files to effectively transmit data via the Internet.

There are basically two types of compression methods for images, lossy and lossless. Lossy compression creates smaller files by discarding some information about the original image. It removes details and color changes it deems too small for the human eye to differentiate. Lossless compression, on the other hand, never discards any information.

The graphic file formats most browsers support are Graphic Interchange Format (GIF) and Joint Photographer Experts Group (JPEG). GIF is a lossless compression method, while JPEG is a lossy compression method.

GIF is the best used with illustrations with areas of solid color, such as line art and logos. GIF formats compress files by reducing repetitive areas, such as large areas of solid color. The more repetition in an image, the more the image can be compressed. This format uses a palette of up to 256 colors to represent the image, and supports background transparency.

JPEG is designed to preserve broad color range and subtle brightness variations of continuous-tone images, such as photographs and images with gradients. This format represents images using millions of colors, thus yielding the best results for compressing full color photographs.

PNG, Portable Network Graphic, was designed specifically to outperform and replace GIF. PNG can match 99 percent of GIF functions. PNG files are typically larger than JPEG or GIF images because a PNG file does not include JPEG's lossy compression, and it can contain more colors than a GIF. So PNG is best suited for small images, navigation buttons, and thumbnails with fine details you don't want mangled by JPEG compression.

Web Links

The most significant difference between a printed page and a Web page is a link, which lets you arrange pages in a website. When you click a link, the Web browser jumps you to the page set as the link's destination.

Links appear as specially marked text or images on a page. Each page can have several links, with each link leading directly to another page within your site or to pages on any other Web server in the world. There are three different types of links – a link within the same Web page, a link to another Web page within the same website, and a link to another website.

Section 508 Law

Accessibility of your content is not only good practice it is the law. As federal employees we are obligated to make our website content accessible to people with disabilities. In 1998, Congress amended the Rehabilitation Act with Section 508 with the intent to breaking barriers for people with disabilities so that they have the exact access to information as other citizens. Under Section 508 (29 U.S.C. '794d), agencies must give disabled employees and members of the public access to information that is comparable to the access available to others.

Accessibility is not a hurdle that you must overcome. In fact, by designing and keeping accessibility in mind you are more likely doing a better job of communicating, period. If you are already designing with W3C standards then accessibility is almost automatic.

Find out more about accessibility, Section 508 standards, and incorporating 508 compliance into your design by exploring the Web-based course "Designing Accessible Websites" on the [Section 508 website](#). This site provides full online training courses and contact information to 508 coordinators for your organization.

SUMMARY

In this chapter we discussed multimedia and how bringing together graphics, images, text and video can be incorporated into your public affairs and visual information plan. More specifically, you learned about digital graphics, multiple page layouts, movie authoring, electronic presentations and websites.

As an MC, it is important to keep your audience in mind when creating your project. All of your creativity and originality will be wasted if your message does not reach your audience. Simplicity and legibility are the keys to an effective presentation.

Further training in multimedia is available at DINFOS via such courses as the Basic Multimedia Illustrator or Digital Multimedia courses or by working on the job with a Shipmate who already possesses these skills. For more information talk to your supervisor and visit the [DINFOS academics Web page](#).

CHAPTER 6

PRINT PRODUCTION

Learning Objectives: Upon completing this chapter you should be able to do the following:

- Describe desktop publishing.
 - Identify different types of desktop printers.
 - Explain the processes of mat cutting and print mounting.
 - Explain binding and finishing.
 - Describe characteristics paper.
 - Describe job control and job order logs.
-

INTRODUCTION

In 1440, Johannes Gutenberg developed what is arguably one of the most important inventions in modern times, a mechanical moveable-type printing press (see figure 6-1). Today, print production continues to be as an important an industry as ever before in disseminating information. In the Navy, operation of today's print production belongs in the hands of mass communication specialists.

As an MC, you will also need to have a basic understanding of printing. In this chapter will discuss the various methods you'll use to produce posters, programs, newsletters and training manuals. These valuable communication products add yet another tool for delivering the Navy's message.

Figure 6-1, Illustration of first printing press, invented by Johannes Gutenberg around 1440.

DESKTOP PUBLISHING PROGRAMS

The term desktop publishing (DTP) came to light in the 1980s upon development of a specific type of software for creating materials for print; however, desktop publishing today encompasses more than just print communication and uses many different types of software. As technology improves so does the capabilities of the software programs we use.

One thing to keep in mind when learning about DTP is that it is easy to confuse DTP with graphic design. MCs use programs like Adobe Illustrator™, Flash™ and Dreamweaver™ to develop concepts, ideas and arrangements for visually communicating a specific message. The *mechanical process* you'll use to turn those ideas of newsletters, posters, and other projects into digital files for printing is DTP.

DTP software is used to create materials for visual communication. Most of the DTP software capabilities can be broken into three basic categories – composition, layout and graphics. These categories combine to make a comprehensive package for designing and publishing multimedia material.

COMPOSITION

Composition defines the sizes and styles of type, the amount of space between horizontal letters and vertical lines, and the coding of the text copy to meet standards. You can edit text directly or input text from documents created in a word processing program and imported into the DTP software.

LAYOUT

Layout, as has been discussed in previous chapters, involves the arrangement of text and graphics on a page. Electronic pasting moves text from one portion to another and incorporates illustrations into the text. Some features include multiple columns, column widths, and gutter space manipulation, printing vertically or horizontally on a page, automatic copy fitting, automatic page numbering, and adding headers and footers.

GRAPHICS

Desktop publishing software can scan or import illustrations/graphics from hard copy or digital data via scanners or other programs as well as add images, borders, lines, arrows and more. You also can alter or edit images by shrinking or expanding them to create a layered four-plate color separation for color reproduction.

DESKTOP PRINTERS

Printers provide a hard copy printout of data stored electronically inside the computer or from a disk. Many printers are primarily used as local peripherals and are attached by a printer cable or, in newer printers, a USB cable to a computer that serves as a document source. Some printers, commonly known as network printers, have built-in network interfaces, typically wireless and/or Ethernet-based, and can serve as a hard copy device for any user on the network. Individual printers are often designed to support both local and network connected users at the same time. In addition, a few modern printers can directly interface to electronic media such as memory cards, or to image capture devices such as digital cameras, scanners; some printers are combined with a scanners and/or fax machines in a single unit, and can function as photocopiers.

DIGITAL PRINTING

Digital printing is printing using digital techniques developed for computer printers such as inkjet or laser printers. The process differs from lithography, flexography, gravure and letterpress printing in several ways:

- Every print can be different, because printing plates are not required, as in traditional methods
- There is less waste chemical and paper, because there is no need to bring the image "up to color" and check for registration and position
- The ink or toner does not permeate the substrate as does conventional ink, but forms a thin layer on the surface and may in some systems be additionally adhered to the substrate by using a fuser fluid with heat process (toner) or UV curing process (ink)
- Because there is less initial setup, it is useful for rapid prototyping, and cost effective for small print runs.

Digital printing is used for personalized printing or variable data printing (VDP or VI), for example personalized children's books, which are customized with the specific child's name and images. Print-on-demand (POD) systems also use digital printing, for short run books of varying page quantities, and binding techniques.

Digital prints can also be done on photographic paper, exposed with RGB laser lights from computer files, and processed in photographic developers and fixers. These prints are continuous tone images and have the dyes imbedded in emulsion layers within plastic coatings. They can be very archival.

Photographic papers are available in a variety of paper surfaces, such as matte, semi-matte, luster, high luster, pearl, and glossy. The use of different paper surfaces depends on the final application of the print. There are two paper surfaces that are used frequently in Navy imaging facilities: glossy and matte. Paper that has a smooth, glossy surface provides a print with higher contrast and higher densities or color saturations, resulting in an apparently sharper image. This is due to the direct reflection quality of the paper surface. Glossy papers are always used for photographic prints that are used to show fine detail, such as equipment damage or intelligence photographs.

Light reflected from matte paper is diffused and provides a softer, lower contrast image. Because of the lower contrast, subject detail does not appear as sharp as an image on glossy paper. Matte papers are used commonly for portraiture and scenic photographs.

PRINTER TYPES

The ink-jet, Noritsu™ ink-jet, laser, thermal transfer, continuous tone die sublimation, and color phase change are nonimpact printers that you may find in a Navy shop.

Ink-jet Printers

Ink-jet printers' spray electrically charged ink through tiny nozzles in the printing element. The ink passes through an electrically charged field that forms the image in matrix form. These printers offer very high-quality resolution and print up to 300 dots per inch (dpi).

Noritsu Ink Jet Printers

Noritsu ink jet printer is the high-quality, digital-imaging equipment ideal for compact space and does not use photographic chemical and solution to develop prints. Noritsu is unique among companies that produce one-hour photofinishing equipment in that they do not produce consumer photographic products, such as film, photographic paper and chemistry.

Laser Printer

A laser printer directs a beam of light that electrically charges an image on a photosensitive drum. Toner attracts and adheres to the dots on the drum and a heating element fixes the image on the paper. These printers can print in excess of 20,000 lines per minute.

Thermal-Dye Transfer Printers

Thermal-dye transfer printers are often called dye sublimation or dye-diffusion thermal-transfer printers.

This system provides high-quality and an environmentally safe method of transferring images to print and transparency materials without using chemicals.

The thermal-dye transfer printing process uses thousands of tiny heating elements that come in contact with "donor ribbons." Each donor ribbon releases a gaseous color dye when heated. Three-color printers have cyan, magenta and yellow ribbons (CMY); four-color printers also include a separate black ribbon (CMYK). The amount of heat from each element controls the amount of dye being transferred to the print material. The blend of the gaseous colors creates a continuous-tone image.

The quality of a thermal-dye transfer print resembles a print made from conventional silver-halide paper. The resolution of thermal-dye transfer printers ranges from 160 to 300 dpi. Resolution is limited by the thermal printing head. Thermal-dye transfer printers can produce prints from 3.5 by 5 inches up to 14 by 17 inches.

Color Phase Change

A color phase change uses Pantone certified colors in a wax medium. Like continuous tone dye sublimation, this is a thermal transfer, but it does not require specially coated paper.

REPRODUCTION EQUIPMENT

A Navy graphics shop contains a wide variety of equipment necessary to produce a variety of high-quality products, from books, posters, brochures and invitations. To use the equipment effectively and safely, you must have a working knowledge of its characteristics, limitations, and operating and maintenance procedures. However, before using any such equipment it is imperative for safety and efficiency to ALWAYS review user's manuals. Know the equipment before you begin production!

DIGITAL DUPLICATION

Digital duplicator is a high-speed digital printing system designed mainly for high-volume photocopying and printing. When printing or copying multiple quantities (generally more than 20) of the same original, it is typically far less expensive per page than a conventional photocopier, laser printer or inkjet printer.

In 1986, the RISO™ Kagaku Corporation introduced the Risograph digital duplicator. It uses duplicator technology but improves on it; it improves upon the traditional mimeograph machine in that the operator does not have to create a stencil. The stencil, called a master, is made by use of a scanner and thermal print head. Also the master is automatically removed as a new one is created and placed in a disposal box. This way the operator should not have to touch the used master material that is coated in ink.

A digital duplicator like the RISO™ is often more cost-efficient than a copier, especially when duplicating high volumes. For smaller print runs the main cost is in the master material. This ranges between 40 and 80 cents per master, depending on the manufacturer. When spread over 20 or more copies the cost per copy is close to photocopiers at 2 to 4 cents. With every additional copy, the costs decrease. At 100 prints the master cost per copy is only .004 to .008 cents per copy, and the cost of the paper printed upon begins to dominate. A master is capable of making 4,000 to 5,000 prints.

The RISO™ has five selectable print speeds (60 to 130 sheets per minute) and a scanning resolution of 400 dpi. It can scan documents for reproduction ranging in size from a business card (2" x 3.5") to ledger size documents (11" x 17"), with an output size ranging from 4" x 6" to 11" x 17". The RISO™ also has a capacity of up to 1,000 sheets of 16-pound bond and can accommodate various substrates ranging from 13-pound bond to 110-pound index stock.

PAPER RECOMMENDATIONS

Print production is more than just reproducing words, images and graphics on a piece of paper. It's about conveying a message and delivering information to an audience. The paper you choose to print your product, therefore, becomes as important as the message, because people can hold the paper in their hands and become familiar with it. The paper is an important part of the overall product.

As you read above, with today's cost-effective, high-volume printers, paper often becomes the most costly portion of print production. So, understanding paper and picking the right paper is of the utmost importance.

Paper is typically defined by its finish, grade and basic weight.

- *Finish* refers to the texture of the sheet. Is it coated or uncoated? Is it smooth, woven, ribbed, glossy or matte
- *Grade* describes the papers classification based upon the type of pulp used, paper treatments, and the end use of the paper. Common paper grades include bond, book, Bristol, cover and newsprint.

—Bond paper is lightweight, high-quality, durable writing paper used for letterhead and stationary.

—Book paper is used when publishing books, as the name implies.

—Bristol paper, named for the town of Bristol, England, is used for brochures, tickets, tags, paperback book covers, file folders and more.

—Cover paper is thick and durable. Also referred to as card stock, cover paper is used for business cards, postcards, playing cards, catalog covers and scrapbooks to name a few products.

—Newsprint is low-cost paper used to print newspapers and other advertising material.

- *Basis Weight* of paper is measured in pounds. The weight of 500 sheets, which is equals a ream of paper cut to a standard size, is its basis weight. And the basis weight is not the same for all paper grades. For example, a ream of letter-size, all-purpose paper you use with your desktop printer may have a basis weight of 20 pounds. This doesn't mean that the ream weighs 20 pounds. It means that with 500 17 x 22-inch sheets of that particular paper weighs 20 pounds.
- *Paper density* is also an important factor to consider when choosing paper for your product. Paper density is a measure of area density. For example, paper that lets in little or no light (poster board) is said to be dense or heavy. Paper that lets in a little bit of light is lightweight.

DIGITAL DUPLICATING TIPS

Photo / Half-Tone Processing

If the original you are duplicating contains photographs or half-tone images, or a multi-colored original is used, select PHOTO or DUO processing by holding down the LINE / PHOTO key on the machine. The current selection will appear in the main display. Since the image is processed graphically, degrees of shading are accurately reproduced.

Producing Enhanced Fine Lines

When producing fine lines, press the IMAGE PROCESSING SELECTION key in the sub-control panel. When this feature is selected, the corresponding indicator lights and "FINE" will appear in the main display. If the original has a colored background, this background may show up on your prints. In that case, cancel this feature. This feature is not available in the duo-processing mode.

Changing Image Contrast on Prints

To achieve different tones on printed copies from those of an original, adjust the scanning contrast manually by canceling the auto-scanning contrast adjustment mode. When this mode is selected, the auto-adjustment indicator will light up. In this case, the scanning contrast will be adjusted automatically according to the darkness of the original being scanned.

Changing Print Density

When the density indicator is lit, you can change print density by manually adjusting the lighter or darker keys. When the print density setting is changed, press the TEST PRINT key to check the results with proof copies.

Note: if the print density levels do not provide the desired result, adjust the scanning contrast and create another master.

Adjusting Horizontal and Vertical Print Positions

The print position can be adjusted vertically (up and down) a maximum of up to +/- 3/4" (20mm) depending on the model used and horizontally (right and left) +/- 3/4" (20mm).

Storing Setting in Memory

The memory feature is flexible tool for automating frequently used or complicated combinations of settings. You can store up to 20 combinations of frequently used or complex print-job settings and apply them to new print jobs whenever necessary.

Protecting Confidential Documents

After printing is complete, the master remains on the print cylinder (drum). Copies of this master can be printed at any time by pressing the START key. To protect confidential documents from unauthorized duplication, press the CONFIDENTIAL key to discard the master after printing.

Return to Initial Settings

To return all the settings to initial status, including print position and reproduction percentage, turn the power off and on again, or hold down the ALL RESET key for more than one second.

Changing Print Color

To print with an optional color cylinder (drum), simply remove the existing cylinder (drum) from your Risograph and replace with the color of choice. When a print cylinder (drum) other than the black one is in place, a "color" message will appear in the main display.

Replacing the Master Roll

If the leading edge of master roll is inserted too far beyond the green films, the excess portion will be automatically cut off. If the strip that has been cut off remains inside the machine, an advisory message will appear in the main display to advise you to remove it. Be sure to remove the cut-off strip.

Preventing Defective Prints

Clean the thermal print head after every two master rolls. Lift up the scanner table and open the master loading unit. Then gently wipe the thermal print head (inside the unit) several times with a soft cloth or tissue dampened with a small amount of alcohol before wiping the thermal print head.

If the machine is not used for a long period of time, ink on the surface of the print cylinder (drum) may dry. Dry ink on the print cylinder (drum) may cause faint or blurred printing.

Using accessories

The *Digitizer III* can be used to edit and adapt originals to be scanned and printed. You can divide an original into areas to create customized prints, using editing features such as framing, screening, outlining, stamping, and reversing. This accessory also provides a feature making it easy to create multicolor prints.

SCANNERS

A scanner allows you to copy a photograph, a drawing, or a text page into the memory of the computer. It does this by measuring tonal or color values and converting them into a binary code that the computer can digest. You may then "clean-up" the image using the appropriate software program before printing a final copy for reproduction. A scanner is particularly useful for copying large amounts of text or images not previously saved on disk that now require revision. When using a scanner, be careful not to violate an existing copyright. To review copyright restrictions, review the SECNAV instructions for [copyright and visual information responsibilities](#).

The four types of scanners are the hand scanner, the flatbed scanner, the copystand scanner, and the slide scanner.

- **Hand scanners** are useful for small-quantity scanning. They read portions or excerpts from a document page into the memory of the computer
- **Flatbed scanners** scan pages out of a book. They scan an entire one- or two-page spread in one view
- **Copystand scanners** are capable of scanning three-dimensional objects
- **Slide scanners** scan slides and transparencies into memory. Scanners used to scan slides and transparencies require a mirrored or reflective attachment.

BINDING AND FINISHING

Binding and finishing is the final stage in creating a printed product. The work required for turning printed sheets into books, magazines, catalogs and booklets is classified as binding. The specialized production of displays, labels, tags, packaging, and a variety of other advertising materials is classified as finishing. Embossing, stamping and other decorative touches used to enhance a book's design also fall into the finishing category. Binding and finishing may be completed at a single facility or by separate suppliers of specific services. Some printers have in-line binding or finishing units attached to their presses, some purchase and use dedicated binding and finishing machinery, and others rely on the services of outside firms.

PAPER CUTTER

The most abused tool in the shop is the paper cutter. Because of this abuse, do not trust the scale at the top of the cutter for accuracy. When you use the cutter, do not force it to cut more material than it can easily handle. Cut only paper or light cardstock. Paper cutters come in a variety of sizes with the most common measuring 36 inches in blade length.

GUILLOTINE CUTTERS

Guillotine cutters are used to square blank sheets before printing and separate printed sheets before binding. These machines are available in a number of models and sizes, but all have several similar components: a knife, cutting stick, table, side and back gauges and a clamp (see figure 6-2).

The cutter's long, heavy knife, which is bolted to a bar mounted near the front of the machine, descends to the bed, slicing through a stack of paper. When properly set and adjusted, the knife will cut through one sheet of paper the full length of the blade and barely rest upon the cutting stick evenly. The knife bar snubber holds the knife in its up position, while the cutter is idling or if the cylinder

becomes worn. If the knife drifts down from its up position, an adjustment is necessary. The knife angle, also called the bevel, is determined by the characteristics of the material to be cut. Hesitation during cutting is an indication of an incorrect beveling of your blade. Consult your operator's manual for sharpening specifications. Different knives are manufactured for materials of varying hardness.

Figure 6-2, Guillotine cutter

Another important cutter component, the cutting stick, is inserted into a groove on the cutter table immediately beneath the cutting knife. Were it not for the cutting stick, the knife would become dull easily or even break because it would hit the metal cutting table every time it sliced through a pile of sheets. Regularly rotate your cutting stick (up to eight times per stick) to ensure a clean cut and long-lasting knife edge.

Side and back gauges position sheets accurately under the knife, squaring them before cutting. The side gauges are stationary, while the back gauge can be moved to accommodate various cut-off lengths. A back gauge that is divided into two or more segments is called a split gauge and allows for the trimming of booklets on more than one side at a time.

Positioning the Back Gauge

To position the back gauge, turn the handwheel located in the center of the table and move the back gauge back and forth. Then, read the distance on the tape and move the back gauge past the size needed. You should stop and return the back gauge forward to the mark. By going past the mark and coming back to it, you take the slack out of the back gauge screw and have an accurate cut each time.

To lock the back gauge in place to prevent it from moving while you are positioning paper, tighten the locking thumbscrew. Avoid continuous heavy jogging against the back gauge of the cutter as this can knock your back gauge out of square. To make stock slide as easily as possible on the cutter table as well as maintain and preserve the cutting bed, wax the table with paste wax.

The cutter clamp is a metal bar that runs parallel to the knife and, like the knife, is placed at a 90-degree angle to the table. It has two functions. First, it expels air from the pile of sheets prior to cutting. Secondly, it holds the pile firmly in place during the process.

FOLDING

Some products you will create in your shop will require folding. This includes, but is not limited to, pamphlets, maps, brochures, and programs. After printing these products, the sheets are folded into **signatures** that may consist of four pages, eight pages, 16 pages, or some other multiple of two. These jobs are said to be **folded to print**. Press sheets with printing only one side of the form are **folded to paper** because backup register is not a consideration (see figure 6-3).

Machine folding employs one of two basic folds: a right angle or a parallel fold. The right-angle fold is made by first folding the sheet in half and then rotating it and folding it in half again. Additional right-angle folds follow this sequence. A basic parallel fold is made by folding a sheet of paper twice so that the two folds are made in the same direction. A variety of configuration can be made from right-angle and parallel folds, including accordion folds, signature folds, gate or panel folds, over and over folds, French folds, and letter folds. Folding is completed on a variety type of folders. A combination or table top folder is what is most often found in the Navy, which incorporates features of both buckle and knife folders in one machine.

Figure 6-3, Common folds (left to right, top to bottom): accordion, eight-page signature, gate, over-and-over, French with heads in, and letter.

Combination Folders

The combination buckle plate/knife folder ("combi") integrates buckle and knife folding. Parallel folds are executed with buckle plates in the first folding station and subsequent right-angle folds are produced in the knife folder section. To create folds parallel to the first right-angle fold, buckle plates are also used. Conveyor tapes forward the sheets through the folder.

Combination machines are ideal for folding medium-size sheets, which often require a variety of different folds. They work well with heavier stock because the thick bulk does not have to pass through as many rollers, and paper grain direction is less of a problem.

PAPER DRILLS

Paper drilling is basically drilling large quantities of paper, or other materials, with round holes. Paper drills can be manual, motorized or fully automated. During the paper drilling process, hollow paper drill bits are clamped into a driven spindle which drills into the pile of paper. Paper drill bits are available in different sizes and with different coating qualities.

Depending on the type of paper drill, either the paper drill bits are lowered into the pile or the table is lifted. Paper drilling machines can be equipped with a different number of spindles which are each built into one paper drill head. The range starts with one- and two-spindle paper drills for small volumes and office purposes and reaches up to paper drilling platforms with more than 20 spindles and paper drill heads.

Applications for paper drilling are file holes for different ring binders, loose-leaf collections, rows of holes for wire comb binding and tags. Many products processed on a paper drilling machine are stationary. Additionally catalogs, manuals and brochures are drilled on a paper drilling system to be able to file them in a binder.

BINDING METHODS

There are several different binding methods; however, in this manual we will discuss the four contemporary binding specialties – mechanical, adhesive or perfect, saddle- and side-wire stitching, and thread sewing, which involves case binding. Of the four specialties, mechanical and saddle and side stitching is most commonly encountered in the Navy.

Mechanical Binding

In mechanical binding, wire or plastic coils, plastic combs, or metal rings are used to permanently join individual sheets of paper together as books or booklets, with the independent binding device often forming the backbone of the publication. Mechanical binding can be costly, but it allows the product to open flatly. A notebook is an example of mechanical binding.

Adhesive Binding

Adhesive, or perfect, binding done in the small Navy print shop is not the same as that done in large commercial print shop binderies, which specialize in that kind of work. Bookbinding is an art in itself. Therefore, it has no place in the small-job shop. However, almost all print shops do the simpler forms of adhesive binding, called padding, which is a standard operation in any small print shop. Padding is the process of making pads or tablets by cementing the edge of the stack of sheets. A pad generally consists of from 50 to 100 sheets of paper and chipboard back.

Saddle and Side-Wire Stitching

Brochures, pamphlets, and thin magazines bound with staples driven through the centerfold along the backbone are some examples of items saddle stitched with wire. This type of stitching is typically the most economical, and like mechanical binding, it allows your products to open flatly.

Products side stitched with wire are fastened together by inserting preformed staples through the side of the booklet or brochure parallel to the backbone. It is important to distinguish between stitching, in which wire is used, and sewing, which relies on thread to secure the signatures (pages) of a publication.

Saddle and side stitchers range from small hand or foot-powered models to large automated machines. Signatures to be side stitched are stacked (gathered) one on top of the other, much as signatures are stacked for perfect binding. Saddle stitched signatures, on the other hand, are inserted, meaning that outer signatures are dropped over inner ones. Saddle stitching, remains the best method of joining publications that are up to ¼ in. (6mm) thick.

Thread Sewing

Thread or cord is used during the thread-sewing bindery process to stitch a book together. Adhesives are also used. After the thread sewing is complete, the book covers are attached using the case binding technique. This process is the most-expensive of the binding processes, and it is usually reserved for hardback books, fine literature, and reference books.

MAT CUTTING AND FOAM BOARD MOUNTING

A mat is a border made of paper or illustration board that compliments as it surrounds an image. Matting a picture is done for protection, ease of handling, framing and appearance. Before displaying or presenting a certificate, a photograph, or a piece of artwork to an individual, you should mount, mat, and if possible, frame it.

Mats

A mat focuses your attention on the image within the mat. When used in a frame, mats protect image surfaces from direct contact with the glass that may trap moisture and cause mildew. When used alone, mats protect image areas from fingerprints and smudges.

Tools

To cut a mat requires skill and patience. You need a pencil, a rule, a steel straightedge, a crafts knife with a sharp blade, sandpaper or an emery board, tape, a mat board, and a backing board. You may be fortunate enough to have a handheld mat cutter or, better still, a carriage-type mat cutter.

Mat Cutter

The two basic types of mat cutters are handheld mat cutters and carriage units. Hand-cut mats require great skill and a steady hand. Carriage units ensure uniformity, speed and accuracy. Carriage units cut oval, round, rectangular, square and fancy-cut mats. They may be large and mounted on a wall or they may be small tabletop units. Both types of mat cutters require a plentiful supply of fresh blades.

Mat Proportions

The width of the top and the sides of a mat are equal. The width of the bottom of the mat is slightly larger in dimension than the top and sides. A good ratio to work with is 3 to 4. When deciding upon inner proportions, ensure you leave 1/8 inch to ½ inch to allow for overlap. This will keep your photograph or document from slipping.

Cutting a mat by hand

The first step when cutting a mat by hand is to prepare the blade for your knife. The key to successful mat cutting is using a sharp blade in your knife and having a stable table. When cutting,

you should place the steel straightedge on the mat and cut along the inside edge. That way, if your knife should slip, the cut would be on the portion of the mat you intended to discard. It is also important to begin your cuts at the corners – hold the knife at a right angle to the mat to make a square cut and at a lesser angle to make a bevel cut. Once you begin cutting, you must maintain the same angle of cut for all sides of the mat, see figure 6-4.

STEP	ACTION
1	Determine overall dimension and measure the opening of the frame.
2	Measure the image area you want exposed through the mat
3	Cut the mat board and a back board the same size as the opening in the frame or the overall desired dimension
4	On the surface of the mat, lightly mark the dimensions of the mat opening
5	Place the steel straightedge on the mat surface to guide your blade
6	Beginning at the corners, cut through the mat board
7	Remove the unwanted portion of the mat
8	Using a piece of sandpaper or an emery board, remove jagged or rough edges
9	Carefully remove pencil lines with a non-abrasive eraser
10	Place a piece of tape along the top edge of the image with the sticky side half on the back of the image and half exposed
11	Carefully position the mat over the image area and press down over the tape
12	Put the back board behind the matted image and place in the frame. If you are not framing the matted image, secure the back board to the back of the mat board with double-sided tape.

Figure 6-4, Instructions for cutting a mat by hand.

CUTTING a MAT with a CARRIAGE TYPE CUTTER

Cutting a beveled mat with a carriage-type cutter is easier than cutting one by hand. Some carriage devices cut straight-edged mats, while other cutters cut oval or round mats. You can use a combination of both types for creative or decorative cuts. The devices maintain a precise angle of cut while you draw the cutting blade across a fixed beam. The blade remains the key to cutting a successful mat, see figure 6-5.

STEP	ACTION
1	Determine overall dimension and measure the opening of the frame.
2	Measure the image area that you want exposed through the mat.
3	On the back side of the mat, mark the dimensions of the desired opening
4	Adjust the cutter stops on the carriage to correspond with the measurements of the inside diameter of the mat, or the major and minor axis of a round or oval mat.
5	Position the mat board face down and align with the left edge of the mat cutter. Apply pressure to the carriage to secure the mat board in place.
6	Insert the blade approx. 1/16th inch above the corner and draw the blade down the carriage beam to just beyond the bottom corner. The stops on the carriage will stop your stroke.
7	Reposition the mat board for each side. The carriage for a round or oval mat will cut the mat in one continuous circular movement.
8	Remove the unwanted portion of the mat.
9	Smooth out jagged or rough edges with sandpaper or emery board.
10	Place and attach the image into the mat and the mat onto the backboard.

Figure 6-5, Instructions for cutting a mat with carriage-type cutter.

PRINT MOUNTING

Like matting, print mounting is a technique used for the displaying or exhibiting of a print, such as a painting, illustration or photograph. The difference between mounting and matting, however, is the way the print is attached to the board. When a print is matted, it is attached to the back of the board and the image is placed behind a cut opening. When matted, a print is often taped into place; thus, the matting can be temporary. Generally, prints that are framed are matted. When a print is mounted, it is attached to the face of a mounting board. In both cases, the board enhances the picture by providing a broad border as well as protecting the edges against damage.

When preparing a print for display, your goal should always be to show off the print in the best possible manner. And, simplicity is most often the best strategy. Stay away from elaborate artwork or fancy lettering as these elements will distract the viewer away from the image.

For exhibition and display, prints are often mounted or matted on a stiff (cardboard-like) board, often called card stock. Card stock used for mounting photographic prints should be free of acid or sulfur that can deteriorate the print quality. Card stock is available in various sizes, colors, textures and weights. There are no hard-and-fast rules for mounting prints, but the card stock should complement the print. The mount should be large enough to balance and support the picture, and the texture and color should complement the overall tone.

The way the print is placed on the mounting board is important. Prints mounted at odd angles or in a corner of the mount will unbalance the photograph. The bottom border on most mounts is the widest border of all. Normally, prints are mounted so the top and side borders of the mount are equal. To provide balance, you should ensure the bottom border is 25 to 35 percent wider than the top and side borders.

Mounting the print onto the card stock is done usually using either the wet or dry method.

WET METHOD

Liquid adhesives, such as rubber cement and spray-on adhesives, can be used to mount prints. These adhesives are easy and clean to use. After they dry, the excess adhesive can be removed easily by rubbing it lightly. The drawback to using rubber cement and spray-on adhesives is that they are not permanent. In time the print may loosen and peel off the mount. This makes rubber cement the ideal adhesive for temporary mounts used in displays or for copying. Gum arabic (natural gum made of hardened sap), glue or paste should be avoided whenever possible. These adhesives are known to stain the print or smear out from around the edges of the print. This causes smudges on the mounting board.

DRY METHOD

A dry print-mounting method that uses a pressure sensitive adhesive is often used with Navy graphics. Pressure-sensitive adhesives come in a variety of sizes in both rolls and sheets. These adhesives form a permanent bond and are easy to use for resin-coated papers.

To use these materials, you simply apply the print to the sticky surface of the mounting material, then peel off the protective backing and apply it to a mounting board. If the print is not aligned correctly, you can remove the print and reapply it. Once the print is correctly in place, you must apply pressure to the print and mounting board. Normally, this is done by running the print and mounting board through a specially designed roller assembly. This assembly applies pressure to the materials being mounted.

Pressure-sensitive adhesive material contains tiny beads of adhesive. The pressure breaks these beads and releases the adhesive. Once pressure is applied to the materials being mounted, a permanent bond is formed.

A dry-mount press can also be used to mount photographic prints. With a dry-mounting press, heat is used to fuse a mounting tissue between the print and the mounting surface.

A dry-mount press is designed to provide uniform pressure and heat. Even pressure is an important aspect of good, dry mounting. Adequate pressure helps squeeze out air from between the adhesive, print and mounting board. You should operate a dry-mount press at the temperature recommended by the manufacturer of the mounting tissue. It is better to use a slightly lower temperature to mount prints than a temperature that is too high. Excessive temperatures may cause damage to the print. When temperatures are too high for resin-coated (RC) papers, the resin coating may blister or bubble.

Porous materials, such as mounting board and rag-stock paper, absorb moisture from the air. This moisture becomes trapped between the layers and causes blisters and bubbles in the finished work. For best results, you should pre-dry the materials before beginning the dry-mounting process. This can be done by heating the mounting board or paper in the mounting press to remove the moisture.

The time required to form a good bond varies when you are using a dry-mounting press. You should mount the prints for a minimum amount of time – the time required to squeeze out air and moisture from the materials and to activate the adhesive. Because different materials have different thicknesses and heat conducting characteristics, you must experiment to determine what amount of time is required to form a good mount. Whenever possible, you should use scraps of materials that are the same as your finished work to determine the best time and temperature for dry-mounting prints. Make notes of the process to reduce time during the next job.

The final stage of finishing for some photographs is to frame them. There are an infinite number of colors and materials available for framing photographs. The same principles apply for framing photographs that apply to mounting or matting prints. Remember to keep it simple and choose a frame that complements the photograph, rather than distracts from the picture.

MOUNTING DISPLAY PRINTS

Many photographers categorize their work as both art and science, and they want their photographs, or images, to be viewed, appreciated, and most importantly, to communicate a message. This is the reason that the salon mount came into use. In photography, to salon mount your image means to mount for exhibition. To mount display prints, you should begin by selecting a mounting board two to four inches larger than the print size. Your selection of color should complement the photograph. Thickness of the board is optional.

The preferred placement of prints for salon mounting is near the *optical center*. This allows for pleasant placement of the photograph while leaving room for the photographer's name and print title below the print. The steps for mounting prints are as follows (see figure 6-6).

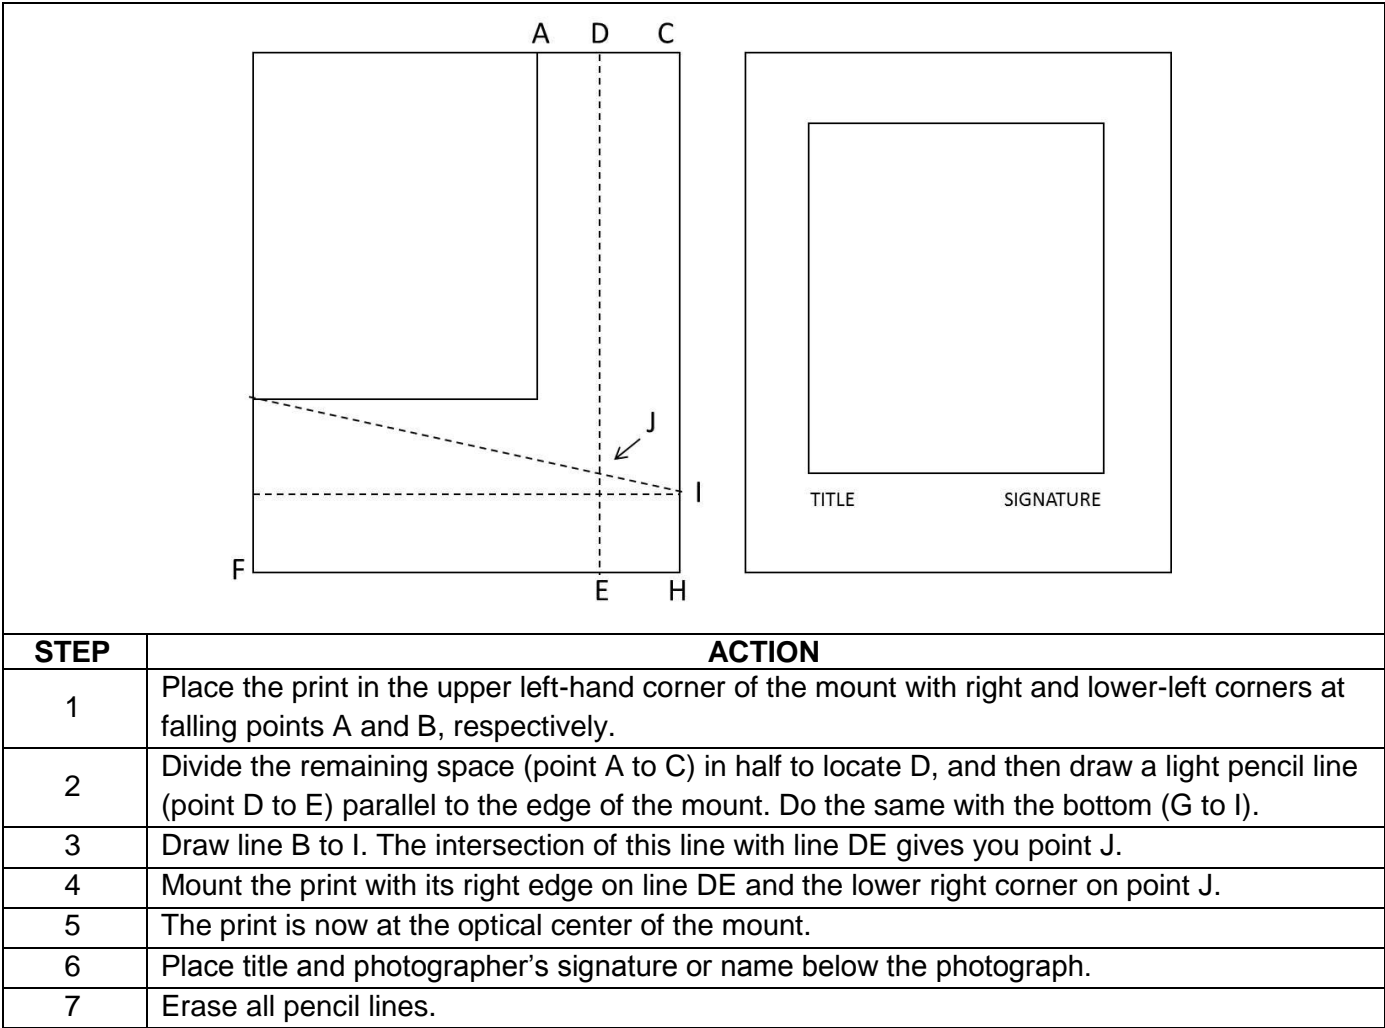

Figure 6-6, Instructions for salon mount.

LAMINATOR

The primary purpose of laminating is to embellish or protect printed documents or images for such things as paperback books, report covers, magazine covers, posters, cards and postcards, in-shop displays, etc. Lamination is most often done with heated roll laminators. Heated roll laminators can vary in size from office-based pouch laminators to industrial-sized machines. Such industrial machines are primarily used for high-quantity/quality output by printers or print finishers. Some machines can double as laminator for the front and provide adhesive to the back of the prints to ease the process of mounting onto the foam board. As with all equipment, refer to user's manual before using your shop's laminator.

ENGRAVER

An engraver routes letters and images below the surface of metals and plastics. Personnel nametags, doorplates, desk plates, and shipboard signage are all examples of engraved products. Engraving is also done on plaques and trophies and shadow boxes.

REPRODUCTION OF MONEY

Before reproducing money in any and all print products that come through your shop, make sure you have reviewed the law that guide the use of money as illustrations, [Section 411 of Title 31 of the Code of Federal Regulations](#). This law provides guidelines for the use of money in illustrations as dictated by the law in accordance with the Counterfeit Detection Act of 1992, Public Law 102-550.

U.S. CURRENCY

The Counterfeit Detection Act of 1992, Public Law 102-550, in Section 411 of Title 31 of the Code of Federal Regulations, permits color illustrations (see figure 6-7) of U.S. currency provided ...

- The illustration is of a size less than three-fourths or more than one and one-half, in linear dimension, of each part of the item illustrated
- The illustration is one-sided
- All negatives, plates, positives, digitized storage medium, graphic files, magnetic medium, optical storage devices, and any other thing used in the making of the illustration that contain an image of the illustration or any part thereof are destroyed and/or deleted or erased after their final use.

Figure 6-7, Proper use of currency in illustrations.

OTHER OBLIGATIONS AND SECURITIES

Photographic or likenesses of other United States obligations and securities and foreign currencies are permissible for any non-fraudulent purpose, provided the items are reproduced in black and white and are less than three-quarters or greater 1.5 times the size, in linear dimension, of any part of the original item being reproduced. Negatives and plates used in making the likenesses must be destroyed after their use for the purpose for which they were made. This policy permits the use of currency reproductions in commercial advertisements, provided they conform to the size and color restrictions.

Motion picture films, microfilms, videotapes, and slides of paper currency, securities, and other obligations may be made in color or black and white for projection or telecasting. No prints may be made from these unless they conform to the size and color restrictions.

EXTERNAL COMMITMENTS

In addition to and external to the command, Navy shops have obligations and responsibilities defined by instruction and practice. Know the commitments of the shop to provide support to units external to your command. These commitments should exist in the form of written agreements. Agreements between units typically define reoccurring services and the basis for financial reimbursement. Although you need not know the intricacies involved in establishing agreements between units, you must know if your shop has such commitments, the extent of the obligation, and the format for finding. These factors can determine how your shop orders supplies and schedules work loads.

- Interservice Support Agreement (ISA) – A formal agreement that defines reoccurring services and the basis for reimbursement.
- Joint Interservice Regional Support Group (JIRSG) – Use on DoD installations.
- Memorandum of Agreement (MOA) – An agreement supplements an ISA, defines a general area of responsibility, and establishes responsibility for reoccurring services.
- Memorandum of Understanding (MOU) – This type of agreement also supplements an ISA. It also identifies expectations of reoccurring support.

JOB CONTROL

The *Navy Visual Information (VI) Management and Operations Manual*, enclosure (1) of SECNAVINST 3104.1A, [Navy Visual Information Program Policy and Responsibilities](#), governs the administration and operation of Navy (VI) activities and functions.

The ability to track photographic jobs within your facility quickly and accurately depends on your shop's job-control system. When a system is not used correctly, photographic requests, prints, and other requirements may be lost or misplaced. This causes an inordinate delay in customer service that has a negative impact on your relationship with other entities.

JOB-ORDER FORM

ALL work performed by Navy VI activities must be documented on a job order form. This form is used to maintain close control of in phases of services. The job-order form serves several purposes; they are as follows: as an official request for visual information (VI) services, as the authority to perform the work, as a record of the time and materials used to complete the job, and as a receipt for

the finished work. Navy imaging facilities may use the Request for Audiovisual Services, OPNAV 5290/1, or a locally created, in-house form.

As a minimum, an in-house form must contain the following information:

- Job order number
- Customer signature block with a disclaimer that the service requested is official work and essential to mission accomplishment
- Product security classification
- Other information required by your facility to accomplish the request officially.

JOB ORDER LOG

All VI activities should assign job order numbers to job orders and should contain data sufficient to avoid duplication of numbers, identify the requesting activity, identify the product, and account for the final disposition of the job, be it a photographic print, multimedia product, or print product. Job order numbers should be set to #1 at the beginning of each fiscal year, which runs from Oct. 1 to Sept. 30 each year. Job order logs must only contain unclassified information. A separate job-order log is maintained for classified work requests.

SUMMARY

In this chapter we discussed print production and how this form of visual information supports our missions, both internally and externally. Whether you're stationed at sea or at a shore command, the production shop will be one of the busiest work centers at your command. Almost every organization within the DoD has a need for the type of services offered by MCs, and it's imperative that you have a basic understanding of desktop publishers, desktop printers and finishing equipment.

To further your knowledge in print production, check out your equipment's user's manuals, the [Navy VI Management and Operator's Manual](#) and The Lithographer's Manual 9th edition, created by the Graphics Arts Technical Foundation.

(This page intentionally left blank).

CHAPTER 7

File Management and Transmission

Learning Objectives: Upon completing this chapter, you should be able to do the following:

- Describe elements of Visual Information Record Identification Number (VIRIN)
 - Describe process of embedding information into image file
 - Describe various file formats
 - List various forms of file transmission
-

INTRODUCTION

Mass communication specialists who produce or manage Department of Defense imagery should take care in properly submitting visual information with captions that are accurate, clear, concise, and in accordance with DoD standards. A properly identified piece of visual information will allow the viewer to know the who, what, when and where about the still image, motion imagery, graphic or multimedia production. This chapter will discuss how to properly identify, embed and transmit visual information in accordance with DoD Visual Information (VI) requirements.

Before continuing on with this chapter, however, it is a good idea to familiarize yourself (download and read) OPNAVINST 3104.1A, [Navy Visual Information Program Policy and Responsibilities](#). Within this instruction, you will find the Navy VI Management and Operations Manual. Like the AP Stylebook used in your writing, this instruction should be within your grasp at all times.

VISUAL INFORMATION RECORD IDENTIFICATION NUMBER (VIRINs)

In accordance with DoD VI requirements, each non-production unit of media that satisfies the definition of official DoD VI record material shall be assigned a visual information record identification number, or VIRIN (pronounced veer-in). Thus, unless discarded, each original 35mm transparency or negative; each original digital still image; and each roll of motion picture film, videotape, or other storage media that is recorded or produced by persons acting for or on behalf of DoD activities, function, or missions shall be assigned a VIRIN.

The VIRIN is assigned at the acquisition level by the originator (i.e., photographer, videographer, producer, graphic artist). Any photograph, digital image, or individual item of media containing motion imagery that is forwarded to the Defense Imagery Management Operations Center (DIMOC), Navy Visual News Service (NVNS) and the Defense Visual Information Center (DVIC) shall have a VIRIN.

STILL IMAGES

VIRINs uniquely identify every image shot by military photographers by using four fields of information – the date the image was shot, the military service affiliation of the photographer, an identification of the photographer, and a sequence number. The VIRIN consists of 15 data elements in

the following format: **YYMMDD-S-VISIONID-NNN**. Following is a description of the data elements for the VIRIN fields (with a hyphen between each field):

Field 1 (YYMMDD): The year, month and day of acquisition or origination.

Field 2 (S): The Service affiliation or status of the camera operator or originator. The code abbreviations are:

A = Uniformed member, civilian employee, or contract employee of the Army
N = Uniformed member, civilian employee, or contract employee of the Navy
F = Uniformed member, civilian employee, or contract employee of the Air Force
M = Uniformed member, civilian employee, or contract employee of the Marine Corps
G = Uniformed member, civilian employee, or contract employee of the Coast Guard
D = Other Civilian or contract employee of the Department of Defense
O = Person not falling into one of categories above

Field 3 (VISION ID): Historically, the last four digits of the originator's social security number were used in this Field 3. However, as of Feb. 1, 2011, this process has changed in an effort to protect personally identifiable information. Field 3 must now consist of the originator's Vision ID code.

To receive a Vision ID code, you must register with DIMOC. Regular contributors should register at <https://vipro.defenseimagery.mil>. People who have never contributed VI content to either DoD or Navy.mil must go to <https://vipro.defenseimagery.mil/newvipro>. If your connectivity is limited or you have issues registering, e-mail DIMOC at dimocops@dma.mil.

Field 4 (NNN): Image or unit of media number in sequential order (beginning with 001 for that same day). Numbering should follow the approximate order in which each unit of media was acquired or originated by the person identified in Fields 2 and 3 on the day identified in Field 1, starting with 001 and continuing consecutively as necessary up to 999. Field 4 of the VIRIN shall reflect the approximate order of a given person's acquisition or origination activities on a given day, without regard to variables such as media, so that no two units of media are assigned identical VIRINs.

Here is an example: **110131-N-AANNN-004**

Additional Notes

- Fields 2 and 3 for an image created by more than one individual shall reflect the individual who was the lead creator or head of the team responsible for creating the image
- Copies shall bear the VIRIN of the original, even if conversions between analog and digital, or changes in medium, format, compression or size occur during the copying process
- Imagery or other units of media which are derived from existing, VIRIN-bearing materials, but which differ significantly in appearance relative to that from which derived, shall, upon creation and unless discarded, be assigned their own VIRIN
- A good rule of thumb is to use the VIRIN as the image's file name
- When the Vision ID of the photographer is unavailable, use "XXXXX" in this field.

MOTION IMAGERY

All submitted motion imagery (such as a videotape, digital file or disc) must be assigned a means of easy identification. Much like still images, VIRINs uniquely identify every piece of video shot by military videographers. Motion media can also be identified by the use of slates and caption sheets by using four fields of information in the VIRIN – the date the imagery was shot, the service affiliation of the videographer, a VIRIN ID of the videographer, and a sequence number. This information is particularly useful to an editor when dealing with a large project that may have multiple tapes or files. Follow the still image guidelines to derive a VIRIN for motion imagery. A VIRIN slate, if possible, should be recorded at the beginning of each scene.

The consolidation of the motion imagery of separate camera original media on to a single videotape, film reel, or storage device must include all applicable VIRINs.

Like a still image, the VIRIN of a video sequence should be used as the filename of the electronic version(s) of the sequence and as the filename of the corresponding run sheet. Naming each file with the VIRIN ensures run sheets and sequences are properly kept together when received.

Video Captions

When writing captions for motion imagery, all the rules in the preceding chapters on style and content apply. The descriptive information provided will necessarily be broader since the caption must describe more than a single image. Provide captions for the sequence and each shot.

Caption information should appear in both the slate and on DD Form 2537, [Visual Information Caption Sheet](#), or in a similar format.

Slates

All video sequences should include a slate at the front of the sequence that contains the following:

- VIRIN
- Videographer name and rank
- Videographer contact information (e-mail and phone number). This information will be deleted during the editing process before the imagery is released to the public.

The release status of the video:

- Released
- Not released
- FOUO (for official use only)
- Not reviewed
- The name, rank and contact information of the releasing authority
- A brief description of the sequence. An example follows:

—U.S. Sailors conduct flight operations aboard the Nimitz-class aircraft carrier USS Ronald Reagan (CVN 76) July 21, 2007, while under way in the Indian Ocean.

The placement of a slate on the video sequence does not replace the requirement to send a caption sheet with the video, either using DD Form 2537 or a text document.

Caption Sheets

The two types of captions for video are sequence captions and shot captions.

A *sequence caption* describes the contents of the entire video sequence. It clearly identifies the documented activity to include the date and location the video was shot. It should also include the following information:

- Full name, rank and title of the person or persons featured in the video, only if included in the entire video sequence. If not featured in the entire sequence, place this information in the shot caption
- Full name and model number of all featured equipment, vehicles, aircraft, or ships, if included in the entire video sequence. If not featured in the entire sequence, place this information in the shot caption
- A brief explanation of the purpose of the event, exercise or operation. Why is the documented action happening and/or why is it significant
- Public release status and instructions at the end of the sequence caption (see above). An example:

—U.S. Navy Air Traffic Controller 2nd Class Esther R. Hines plots ship coordinates in the amphibious air traffic control center aboard USS Iwo Jima (LHD 7) May 2, 2007. Iwo Jima is conducting an expeditionary strike group exercise in preparation for an upcoming deployment. (U.S. Navy video by Mass Communication Specialist 1st Class April Myers/Not Released)

—Not cleared for public release by Lt. John Doe, USS Navy Ship PAO, john.doe@navy.mil, DSN 456-7890.

Shot captions

Shot captions are shot-by-shot breakdowns of the video sequence that include information pertinent only to that section of time code. If the information is applicable to the entire sequence, place it in the sequence caption (see above).

- Place the time code in hour/minute/second/frame format
- Include changes of camera field of view. Use the following abbreviations to indicate camera field of view:

—ES – establishing shot

—LS – long shot

—MS – medium shot

—CU – close up

—ECU – extreme close up

- Place release status at the end of each shot caption
- Examples of properly constructed shot captions:

—00:02:01:14MS – U.S. Navy Capt. John Smith presents a diploma to Seaman Joe Dean.
(Released)

—00:02:08:05MS – U.S. Navy Capt. John Smith presents a diploma to Seaman Larry Owens.
(Released)

—00:02:15:22LS – Graduates march in review. (Not Released)

DIGITAL FILE NAMING

Keeping track of and organizing image files are of essential importance when working with still and video images. As mentioned above, a good organization method is to use the product's VIRIN as the file name, unless the software you are using does not support the VIRIN's format. If system software does not support long file names, use the standard 8.3 file name convention. The first six characters are the date in VIRIN format with the last two characters of the VIRIN added (the sequence number). Make sure that the file extension reflects the file format that is used. An example of a digital still image file in 8.3 format would be 980430-N-AANNN-005 becoming 98043005.jpg. (See file formats below for amplifying information).

FILE FORMATS

File formats are machine languages that save each binary digit or bit in a file according to special codes that tell the program how to arrange and present the information. Special codes for one program are not necessarily the same special codes for other software. In this section, we will discuss several terms associated with image files as well as the most common types of file formats you will see in your work as an MC. These formats are listed in alphabetical order vice order of common usage.

ADVANCED AUDIO CODING (AAC)

AAC was developed to improve upon the MP3 audio format and uses a more advanced form of compression. According to some listening tests, AAC files encoded at lower bitrates (like 96 Kbps) sound as good as or better than MP3s encoded at higher bitrates (like 128 Kbps) despite their smaller size. The current version of the AAC codec was developed as part of the MPEG4 standard. Files may appear with the ".m4a" or ".mp4" filename extension. Songs with DRM (digital rights management) usually have an ".m4p" extension (with the "p" at the end to denote "protected").

AUDIO INTERCHANGE FILE FORMAT (AIFF)

AIFF is an audio format for Macintosh™ operating systems commonly used for storing uncompressed, CD-quality sound. This format is similar to WAV files used in Microsoft Windows™-based systems. AIFF is considered a lossless container format.

APPLE LOSSLESS

Apple™ Lossless (also known as Apple Lossless Encoder, ALE, or Apple Lossless Audio Codec, ALAC) is a lossless audio codec developed to provide full, CD-quality audio in about half the space of the original file.

ENCODED AUDIO FORMAT (AU)

Used primarily on Sun or UNIX systems, AU is an audio format commonly used for posting sound clips on the Internet. AU files can be played back on Windows, Macintosh, and other operating systems.

ADVANCED VIDEO CODING HIGH DEFINITION (AVCHD)

AVCHD is a high-definition digital video format that can record in 1080i and 720p and still maintain a reasonably small file size. AVCHD files are based on the MPEG4 codec. The advent of high-definition (HD) televisions and displays spurred the development of this format, which uses the same resolution as HDTV signals. AVCHD video files can also be burned to Blu-ray discs™.

AUDIO/VIDEO INTERLEAVED (AVI)

AVI is a file format for storing and playing back movie clips with sound on Windows™-based PCs. An AVI file is organized into alternating ("interleaved") chunks of audio and video data. AVI is a container format, meaning that it specifies how the data will be organized, but is not itself a form of audio or video compression. AVI is the type of file created when DV clips are imported from a digital camcorder to a PC. These clips are often referred to as DV-AVIs, because they contain full-quality digital video content.

BITRATE

Bitrate is the average amount of data required to store one second of music, expressed in kilobits per second, or Kbps, with audio compression. Some codecs like MP3, WMA, and AAC allow files to be encoded at different bitrates. Generally, as bitrate decreases, so does the sound quality of the resulting file, as well as the amount of memory required to store it.

BITMAP IMAGE (BMP)

BMP is a standard format used for storing images on Windows-based PCs. BMP images can either be compressed or uncompressed. This type of file also sometimes appears with the ".DIB" extension.

CODER-DECODER (CODEC)

Codec is software that takes a raw data file and turns it into a compressed file. Because compressed files only contain some of the data found in the original file, the codec is the necessary "translator" that decides what data makes it in to the compressed version and what data gets discarded. Different codecs translate in different ways, so a file compressed using the one codec will be different from a file compressed using another codec. Sometimes the difference is noticeable, sometimes not, but it's good to be aware of what codecs are best for what you're trying to do in order to maintain the best ratio of file size to quality.

COMPRESSION

Because it takes up so much space, video must be compressed before it is put on the web. To compress means to pack the information into a smaller space. As discussed in previous chapters, the two types of compression are lossless compression and lossy compression.

DIGITAL VIDEO (DV)

DV is the format used by most digital camcorders. Although the DV format employs a form of lossy video compression (applied in real-time as you record with your camera), this format is still memory-intensive. When transferred to a computer, a DV clip requires roughly 1 GB of storage per five minutes of video. Clips are usually stored on the computer as QuickTime™ or .avi files. Despite its use of compression, DV can provide a clean image with up to 520 lines of resolution. DV uses a type of compression known as "intraframe" — that is, it encodes video at the full standard frame rate of 30 frames per second. This allows frame-by-frame editing. In contrast, video codecs like MPEG1 or MPEG2 tend to handle video sequence by reducing the number of full frames per second and encoding the differences between frames, making precise editing more difficult. These are known as "interframe" forms of compression.

GRAPHICS INTERCHANGE FORMAT (GIF)

GIF creates a table of up to 256 colors from a pool of 16 million. If the image has fewer than 256 colors, GIF can render the image exactly. When the image contains many colors, the software that creates the GIF will use any of several algorithms to approximate the colors in the image with the limited palette of 256 colors available. Better algorithms search the image to find an optimum set of 256 colors. Sometimes GIF uses the nearest color to represent each pixel, and sometimes it uses *error diffusion* to adjust the color of nearby pixels to correct for the error in each pixel.

GIF achieves compression in two ways. First, it reduces the number of colors of color-rich images, thereby reducing the number of bits needed per pixel, as just described. Secondly, it replaces commonly occurring patterns (especially large areas of uniform color) with a short abbreviation. Instead of storing "white, white, white, white, white," it stores "five white."

Thus, GIF is lossless only for images with 256 colors or less. For a rich, true color image, GIF may "lose" 99.998 percent of the colors.

JOINT PHOTOGRAPHIC EXPERTS GROUP (JPEG)

JPEG is optimized for photographs and similar continuous tone images that contain many, many colors. It can achieve astounding compression ratios even while maintaining very high image quality, while GIF compressions are unkind to such images. JPEG works by analyzing images and discarding kinds of information that the eye is least likely to notice. It stores information as 24 bit color.

It is important to remember that the degree of compression of JPEG is adjustable. At moderate compression levels of photographic images, it is very difficult for the eye to discern any difference from the original, even at extreme magnification. Compression factors of more than 20 are often quite acceptable. Good graphics programs allow you to view the image quality and file size as a function of compression level, so that you can conveniently choose the balance between quality and file size. A form of this codec known as Motion JPEG is used by some digital cameras and camcorders for storing video clips of relatively small file size. With Motion JPEG, each frame of video is captured separately and reduced in size using JPEG compression.

LOSSLESS DATA COMPRESSION

Lossless data compression retains all of the data of the original file as it is converted to a smaller file size. When a lossless file such as a TIFF is opened, algorithms restore all compressed information, creating a duplicate of the source file. Lossless compression is generally preferred for creating high-quality or professional-grade audio and video files where retaining fine detail is important.

LOSSY DATA COMPRESSION

In lossy data compression, some source file information is discarded to conserve space. When the file is decompressed, this information is reconstructed through algorithms, usually resulting in some loss of sound quality or image detail when compared to the original. Generally, the higher the resolution of a compressed file, the slighter the degradation. An MP3 file with a resolution of 256 Kbps, for example, tends to sound more like the source file than one made at 64 Kbps.

MUSICAL INSTRUMENT DIGITAL INTERFACE (MIDI)

A MIDI file does not contain actual audio data; it contains commands that let MIDI-capable synthesizers recreate a specific musical passage. MIDI protocol has been used for years as a way for electronic musical instruments, like digital keyboards and sequencers, to communicate with each other. Computer sound cards typically feature the ability to interpret MIDI files into music. Since they don't actually contain the music itself, but rather the commands used to recreate music, MIDI files are a lot smaller than audio files like MP3s, WMAs, or WAVs. MIDI files are small and manageable enough that it's not uncommon to find them embedded in web pages, adding a sonic element to the surfing experience. They usually appear with the ".MID" filename extension.

MOVING PICTURE EXPERTS GROUP (MPEG)

The Motion Picture Experts Group is a committee that sets international standards for the digital encoding of movies and sound. There are several audio/video formats that bear this group's name. In addition to their popularity on the Internet, several MPEG formats are used with different kinds of A/V gear:

MPEG1

MPEG1 is a format often used in digital cameras and camcorders to capture small, easily transferable video clips. It is also the compression format used to create video CDs, and commonly used for posting clips on the Internet. The well-known MP3 audio format (see definition below) is part of the MPEG1 codec.

MPEG2

Commercially produced DVD movies, home-recorded **DVD** discs, and most digital satellite TV broadcasts employ MPEG2 video compression to deliver their high-quality picture. MPEG2 is a form of lossy compression that rivals the DV format when it comes to picture quality. Because MPEG2 is a "heavier" form of compression that removes a larger portion of the original video signal than DV, it is more difficult to edit with precision. The MPEG2 codec allows for selectable amounts of compression to be applied, which is how home DVD recorders and hard disk video recorders can offer a range of recording speeds. MPEG2 is considered a container format.

MPEG4

MPEG4 is a flexible MPEG container format used for both streaming and downloadable Web content. It is the video format employed by a growing number of camcorders and cameras.

MP3 (MPEG1, Audio Layer 3)

MP3 is the most popular codec for storing and transferring music. Though it employs a lossy compression system that removes frequencies judged to be essentially inaudible, MP3 still manages to deliver near-CD sound quality in a file that is only about a 1/10th or 1/12th the size of a corresponding uncompressed WAV file. When creating an MP3 file, you can select varying amounts of compression depending on the desired file size and sound quality.

MP3PRO

MP3PRO is an updated version of the original MP3 codec. These small, low-bitrate files contain much more high-frequency detail than standard MP3 files encoded at similar low bitrates. The high-frequency portion of the audio signal is handled by an advanced and extremely efficient coding process known as spectral band replication (SBR), while the rest of the signal is encoded as a regular MP3. That means that when you play an MP3Pro file on non-MP3Pro-compatible software, you will only hear the non-SBR-encoded portions (so you'll lose the highs altogether). However, when encoded and played back using a fully compatible audio program, mp3Pro files deliver very good sound quality using low bitrates.

QUICK TIME™ MOVIE (MOV)

An MOV is a file format for storing and playing back movies with sound. This type of file contains composition information, but no movie data, which takes up minimal disk space.

RAW

RAW is an image file of minimally processed data received from a digital camera. Most camera manufacturers have their own proprietary version of the RAW image format, and their own file suffixes. Professionals prefer shooting in RAW because the additional information these large files contain allows greater flexibility in post-production editing. Because the image is basically unprocessed, as compared to a JPEG image, RAW files can retain very subtle color variations and fine detail. Color changes, contrast adjustments, and other manipulations of a RAW image yield significantly fewer digital artifacts than the same changes made to a comparable JPEG file.

REALMEDIA™

RealMedia is one of the most popular formats for streaming content on the Internet. RealMedia includes the RealAudio codec for sound clips and RealVideo codec for movies. RealAudio and RealVideo files are often given the common RealMedia ".rm" file extension. RealMedia is a container format that's often heavily compressed for streaming over dial-up Internet connections. RealMedia variable bitrate (RMVB) has been developed for VBR streaming files.

SOUND DESIGNER II (SDII)

SDII is an audio format for Macintosh™ operating systems which is often employed by pro-quality sound editing software applications. SDII files, like AIFF and WAV files, are capable of storing uncompressed CD-quality audio.

SECURE DIGITAL MUSIC INITIATIVE (SDMI)

The Secure Digital Music Initiative was established to standardize digital music file specifications throughout the industry. The primary purpose was to create a uniform copyright protection protocol that would work with a variety of digital players, software programs, and download sites. SDMI-compliant devices and files have special coding to recognize and comply with the requirements imposed on copyright-protected materials.

PORTABLE NETWORK DOCUMENT (PNG)

PNG is a lossless storage format; however, in contrast with common TIFF usage, it looks for patterns in the image that it can use to compress file size. The compression is exactly reversible, so the image is recovered exactly.

PHOTOSHOP™/PAINTSHOP™ (PSD/PSP)

PSD/PSP are proprietary formats used by graphics programs. These are the preferred working formats as you edit images in the software, because only the proprietary formats retain all the editing power of the programs. These packages use layers, for example, to build complex images, and layer information may be lost in the non-proprietary formats such as TIFF and JPEG. However, be sure to save your end result as a standard TIFF or JPEG, or you may not be able to view it in a few years when your software has changed.

TAG IMAGE FILE FORMAT (TIFF)

TIFF is a flexible [container](#) format for digital still images, commonly used in desktop publishing. TIFF images can incorporate various forms of compression (like JPEG) or can be uncompressed. Some digital cameras offer a special TIFF mode for capturing uncompressed photos; however, these files require many times more storage space than JPEGs and can quickly fill up your camera's available memory.

WAVEFORM AUDIO FILE FORMAT (WAV)

WAV is a standard audio format for Windows™ operating systems, often used for storing high-quality, uncompressed sound. WAV files can contain CD-quality (44.1 KHz/16-bit) audio signals. However, CD-quality WAV files require relatively large amounts of memory – roughly 10MB per minute of music. WAV is a container format.

WINDOWS MEDIA AUDIO (WMA)

WMA is one of today's most pervasive Internet audio formats. Though not as popular as MP3, proponents of lossy WMA claim that it can outperform MP3 in the area of sound quality, particularly with files encoded at lower bitrates such as 64 or 96 Kbps. This performance advantage makes it

handy for applications like portable digital audio players, where total play time is limited by a finite amount of internal memory.

WINDOWS MEDIA VIDEO (WMV)

WMV is Microsoft's™ proprietary lossy compression format for motion video. It is used for both streaming and downloading content via the Internet.

EMBEDDING INFORMATION

When submitting visual information, you must embed pertinent information about the image into the image's file information. This information is called information interchange model caption (IPTC), or metadata. The metadata contains identification, contact information, the caption and keywords about the photograph. Embedded information makes the file searchable on the computer and/or the Internet. While some metadata is written by the camera, most is input by the photographer after downloading. Different commands use various software programs to embed information. For detailed guidance on embedding caption and metadata information, consult your commands specific editing software manual. A DOD caption cross reference sheet is available at the following websites:

- <http://www.defenseimagery.mil/learning/captionstyle/metadateref.html>
- <http://www.chinfo.navy.mil/visualnews/training.html>

TRANSMISSIONS

So, you have your image or video file with all required information attached or embedded, to include VIRIN info and metadata. Now what? In today's world of up-to-the-minute news coverage, there's a constant demand for current images of activities throughout the Department of Defense showing the department's activities, exercises and operations.

Your next step is to move your product from your command to the rest of the world. There are several options for moving these files. As a general rule, however, you should use either file transfer protocol (FTP) or fast file transfer (FFT).

FILE TRANSFER PROTOCOL (FTP)

A simple network protocol based on Internet Protocol (the method or protocol by which data is sent from one computer to another on the Internet known as the host) as well as a term used when referring to the process of copying files when using FTP technology. To transfer files with FTP, you use a program often called the "client." The FTP client program initiates a connection to a remote computer running FTP "server" software. After the connection is established, the client can choose to send and/or receive copies of files, singly or in groups. To connect to an FTP server, a client requires a username and password as set by the administrator of the server.

FAST FILE TRANSFER (FFT)

Fast File Transfer (FFT) is a client-server based transmission application that allows users to transmit computer files of any type and size (files larger than 1 GB are routinely moved) using Windows based computers over IP-based networks much faster and more reliably than File Transfer Protocol (FTP) methods. Using multiple data threads, the application speeds transmission of files by "flooding" the available bandwidth, throttling itself to ensure that the network is available for other

network activity. Such error handling ensures that upon successful transmission completion, there is no corruption in the files transmitted. The client application itself is easy to install and use. The installer is a standard application installer. There is no licensing information needed as all licensing is done at our receiving servers. When the client is launched, enter the username, password and host address of the FFT server.

For more information, check out Navy Visual News Service's guidance on [sending files](#).

SAFEGUARDING CLASSIFIED MATERIAL

Modern methods of conducting war and safeguarding our nation require a tremendous amount of information. This information is stored in books and files, aggregated into reports, gathered by intelligence activities, and transferred in the form of letters, messages, photographs, and audio and video recordings. This information is sifted and organized in the minds of the people directing the war effort and those keeping the peace. Much of this information is extremely valuable to our enemies, and, therefore, must be kept classified and safeguarded in the interest of national security.

In performing your job as a Navy MC, you may have access to classified information. Therefore, you **MUST** become aware of the importance of safeguarding all classified information to which you have access.

Classification categories, procedures, and related security information pertaining to the Navy are contained in the *Department of the Navy Information and Security Program Regulation*, OPNAVINST 5510.1 (series).

SUMMARY

Congratulations, you have reached the end of the MC basic rate training manual. Through these pages, you have learned the basics of what is required of you to perform your duties in telling the story of America's Navy. Specifically, in this chapter, however, we discussed moving your visual information products from your command to higher headquarters as well as basic information on file types and file terminology.

Your learning should not stop here. You must take this information and begin building a toolbox that will move you from where you are now and transform you into an expert in the mass communication field. Good luck and see you about the fleet!

APPENDIX I

MC ACRONYMS – MODULES 1 & 2

AAC	<i>Advanced Audio Coding</i>
AFRTS	<i>Armed Forces Radio and Television</i>
AIFF	<i>Audio Interchange File Format</i>
ARPA	<i>Advanced Researched Project Agency</i>
ASD(PA)	<i>Assistant Secretary of Defense for Public Affairs</i>
AU	<i>Encoded Audio Format</i>
AVCHD	<i>Advanced Video Coding High Definition</i>
AVI	<i>Audio/Video Interleaved</i>
BMP	<i>Bitmap Image</i>
BNC	<i>Bayonet Neill-Concelman</i>
CBT	<i>Computer Based Training</i>
CCD	<i>Charged Coupled Device</i>
CCU	<i>Camera Control Unit</i>
CD-ROM	<i>Compact Disc Read Only Memory</i>
CE	<i>Civilian Enterprise</i>
CHINFO	<i>Chief of Information</i>
CMY	<i>Cyan, Magenta and Yellow</i>
CMYK	<i>Cyan, Magenta, Yellow & Key (black)</i>
CODEC	<i>Coder-Decoder</i>
COMCAM	<i>Combat Camera</i>
CP10	<i>Continuing Promise 2010</i>
CSS	<i>Cascading Style Sheets</i>
CU	<i>Close-Up</i>
DIMOC	<i>Defense Imagery Management Operations Center</i>

Assignment Questions

Information: The text pages that you are to study are provided at the beginning of the assignment questions.

ASSIGNMENT 1

Textbook Assignment: *“Introduction to Visual Information”, Chapter 1.*

1-1. Which of the following products is NOT an example of visual information?

1. Illustrations
2. Command Brief
3. All Hands Update
4. Public Affairs Guidance

1-2. Which of the following military leaders is responsible for the implementation and administration of the Navy’s visual information program?

1. Chief of Information
2. Director, Combat Camera
3. Chief of Naval Operations
4. Director, Defense Media Activity

1-3. Which of the following Navy policies governs the use, management and assignment of Navy visual information?

1. OPNAVINST 3104.1
2. OPNAVINST 3104.3
3. DOD Directive 5040.1
4. SECNAVINST 5720.44

1-4. Which of the following Navy policies governs combat camera responsibilities and procedures?

1. OPNAVINST 3104.1
2. OPNAVINST 3104.3
3. DOD Directive 5040.1
4. SECNAVINST 5720.44

1-5. Which of the following government entities supports worldwide DoD and other government agencies with the right imagery at the right place and time?

1. Defense Media Activity
2. Defense Visual News Service
3. Defense Imagery Management Operations Center
4. Defense Video & Imagery Distribution System

1-6. DoDINST 5040.05 outlines which of the following aspects of visual information?

1. Copyright
2. Visual Information Tactics
3. Alteration of Official Imagery
4. Joint PA Support Element Operations

1-7 Which of the following techniques often goes against DoD and Navy VI ethics when enhancing imagery?

1. Dodging & Burning
2. Cropping & Scaling
3. Masking an area of the image in support of criminal investigations
4. Cloning area for placement in separate image

(This page intentionally left blank).

ASSIGNMENT 2

Textbook Assignment: "Lighting and Color", Chapter 2.

2-1. *What happens to light when it travels through a transparent medium, such as glass ?*

1. It stops
2. It speeds up
3. It slows down
4. It bounces back

2-2. *What happens to light when it strikes a rough surface?*

1. It stops
2. It is absorbed
3. It reflects back in many directions
4. It reflects back at the same angle

2-3. *Which of the following types of reflection occurs when light strikes a smooth surface?*

1. Diffused
2. Specular
3. Conflicted
4. Translucent

2-4. *Which of the following is NOT a factor that affects reflected light?*

1. Color
2. Intensity
3. Direction
4. Sharpness

2-5. *Which of the following terms describes the type of medium only transmits a portion of light, and objects behind such media are not clearly seen?*

1. Diffused
2. Opaque
3. Transparent
4. Translucent

2-6. *Which, if any, of the following colors theoretically represents the absence of light?*

1. Gray
2. Black
3. White
4. None of the Above

2-7. *Which of the following colors is not one of the three colors of light as seen in the visible spectrum?*

1. Red
2. Blue
3. Green
4. Yellow

2-8. *What happens to light when it passes through a prism?*

1. It intensifies
2. It changes direction
3. It lessens in intensity
4. It separates light into the visible spectrum

2-9. Which of the following terms describes what happens to light during a solar eclipse?

1. Dispersion
2. Diffraction
3. Refraction
4. Inversification

2-10. Which of the following types of light is seen as a glare?

1. Diffused
2. Fluorescent
3. Plane Polarized
4. Tungsten Halogen

2-11. Which of the following items is the most important ingredient in photography?

1. Light
2. Color
3. Subject
4. Placement

2-11. Which of the following factors determines the quality of sunlight?

1. Direction and Strength
2. Direction and Time of Day
3. Strength and Cloud Coverage
4. Time of Day and Cloud Coverage

ASSIGNMENT 3

Textbook Assignment: “Photography”, Chapter 3.

3-1. Which of the following steps is the first you should take upon being assigned a new DSLR camera?

1. Talk to your LPO
2. Clean the camera's lens
3. Go out and shoot test shots
4. Read the camera's user manual

IN ANSWERING QUESTIONS 3-2 THROUGH 3-9 SELECT THE PHOTOGRAPHIC TERM THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

3-2. Widest angle at which light entering a lens produces a usable portion of the circle of illumination at the focal plane.

1. Angle of field
2. Depth of field
3. Shutter angle
4. Asymmetrical junction

3-3. The usable portion of the circle of illumination.

1. Exposure
2. Angle of field
3. Depth of field
4. Circle of good definition

3-4. Variable opening through which light passes into a camera.

1. Iris
2. f/stop
3. Shutter
4. Aperture

3-5. Range of acceptably sharp focus in front of and behind the center of interest.

1. Exposure
2. Perspective
3. Depth of field
4. Circle of good definition

3-6. Thin sheet that covers the camera's charge-coupled device (CCD).

1. Iris
2. Shutter
3. Aperture
4. Diaphragm

3-7. Derived from the a Latin phrase meaning dark chamber, it is a light box used to capture images.

1. Iris
2. Camera
3. Diaphragm
4. Digital imaging

3-8. Amount of light falling on a unit area of a digital sensor.

1. f/stop
2. Exposure
3. Light index
4. Shutter speed

3-9. Controls the amount of light passing through the lens and striking the CCD.

1. f/stop
2. Exposure
3. Depth of field
4. Shutter speed

3-10. What happens to the depth of field when you lower your f/stop?

1. It expands
2. It disappears
3. It is shallower
4. It is shallower Nothing changes

3-11. Which of the following terms best describes the length of time the shutter stays open?

1. CCD release
2. Shutter speed
3. Light duration
4. Aperture control

3-12. Which of the following situations occurs when you use a higher shutter speed?

1. Faster shutter speed, shorter exposure
2. Faster shutter speed, longer exposure
3. Slower shutter speed, shorter exposure
4. Slower shutter speed, longer exposure

3-13. Which, if any, of the following actions best describes what happens when you put your camera on the "bulb" setting?

1. Slows the shutter speed
2. Speeds up the shutter
3. Keeps shutter open when shutter release button is held
4. None of the above

3-14. Which of the following shutter speeds lets you a) blur action and b) freeze action?

1. a) 1/60 b) 1/250
2. a) 1/250 b) 1/60
3. a) B b) 1/500
4. a) 1/500 b) B

3-15. Which of the following actions is controlled by the ISO setting?

1. Stops release of shutter
2. Changes focus from auto to manual
3. Determines depth of field
4. Controls amount of light that enters DSLR

3-16. Which of the following terms best describes the common rule for estimating correct daylight exposure?

1. Obscura
2. Mnemonic
3. Sunny f/16
4. Equivalent exposure

3-17. Which of the following terms describes the doubling and halving relationship between the aperture and the shutter?

1. Obscura
2. Mnemonic
3. Sunny f/16
4. Equivalent exposure

3-18. Which of the following is NOT a reason for knowing understanding basic exposure settings?

1. Light meters are mechanical; they may be inconsistent, wrong, or even fail
2. Light meters can't think for themselves; you may want to override reading if special lighting situations
3. You may want to control depth of field and stop action vice the camera doing it
4. All of the above

IN ANSWERING QUESTIONS 3-19 THROUGH 3-22 SELECT THE TYPE OF LENS THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

3-19. Less than 40mm focal length and used in confined spaces or when photographer wants to cover a large area.

1. Macro
2. Fisheye
3. Telephoto
4. Wide-angle

3-20. Used for close-up photography and is capable of producing life-size images?

1. Macro
2. Fisheye
3. Telephoto
4. Wide-angle

3-21. Greater than 58mm focal length and appears to compress the perspective of an image.

1. Macro
2. Fisheye
3. Telephoto
4. Wide-angle

3-22. Makes objects appear to diminish in size rapidly as the distance from the camera increases and objects close to the camera appear far apart.

1. Macro
2. Fisheye
3. Telephoto
4. Wide-angle

3-23. In photographic terms, which of the following best describes astigmatism?

1. Optical center of the lens
2. Hyperfocal distance from the lens
3. Lens aberration that causes an off-axis point
4. Out-of-focus image, resulting from improper lens adjustment

IN ANSWERING QUESTIONS 3-24 THROUGH 3-29 SELECT THE CAMERA ACCESSORY THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

3-24. Dyed in a specific manner in order to absorb light of certain colors.

1. Filter
2. Flash
3. Snoot
4. Scrim

3-25. Measures light.

1. Filter
2. Snoot
3. Lens hood
4. Light meter

3-26. Three-legged support for the camera.

1. Tripod
2. Hot shoe
3. Monopod
4. Lens hood

3-27. Electronic storage device.

1. Coaxial
2. Share point
3. Tandem cord
4. Memory card

3-28. Keeps strong sunlight from striking the lens.

1. Snoot
2. Barn door
3. Lens hood
4. Light meter

3-29. High-voltage light source that produces momentary high-intensity light.

1. Filter
2. Flash
3. Shutter
4. Light stream

3-30. At what distance from the subject's face should you hold the light meter when taking a reading?

1. 3 inches
2. 4 inches
3. 5 inches
4. 6 inches

3-31. Which, if any, of the following methods of measuring light is being used when the light meter is held at the position of the subject with the photoelectric cell toward the camera?

1. Incident
2. Reflected
3. Integrated
4. None of the Above

3-32. Which of the following occurs when light is transmitted through a filter?

1. The color of light is modified
2. The amount of light is reduced
3. The vibration direction of the light rays is limited
4. All of the above

3-33. Which of the following type of filters reduces the amount of light without changing the reproduction of colors?

1. Gelatin
2. Polarizing
3. Monochrome
4. Neutral density

3-34. What type of filter changes the way your camera sees and treats light and reduces the effects of haze?

1. Gelatin
2. Polarizing
3. Monochrome
4. Neutral density

3-35. What color is a light meter calibrated to see?

1. White
2. Black
3. Dark gray
4. Middle gray

3-36. Which of the following light meter methods requires you to take two readings from a scene – highlighted area and shadow area?

1. Bracketing
2. Darkest object
3. Brightest object
4. Brightness range

3-37. When employing the substitution light meter method of tiny objects or in a confined space, what can you use to take the place of the subject's gray tones?

1. Black card
2. White card
3. Camera bag
4. Back or palm of hand

3-38. Which of the following photo terms is defined as "the pleasing arrangement of subject-matter elements within the image"?

1. Contrast
2. Exposure
3. Composition
4. Center of interest

IN ANSWERING QUESTIONS 3-39 THROUGH 3-40 SELECT THE GENERAL RULE OF COMPOSITION THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

3-39. *Tic-tac-toe like pattern that divides an image to locate the possible center of interest.*

1. Pattern
2. Perpendicular
3. Rule of thirds
4. Dynamic symmetry

3-40. *Center of interest found by drawing or imagining a diagonal line from one corner to another, then a perpendicular line to the first line from the third line?*

1. Pattern
2. Perpendicular
3. Rule of thirds
4. Dynamic symmetry

3-41. *Which of the following composition techniques appears to make an image appear harmonious?*

1. Unity
2. Pattern
3. Balance
4. Harmony

3-42. *Which of the following describes a line that directs the viewer's eyes to an image's center of interest?*

1. Leading
2. Symmetrical
3. Asymmetrical
4. Perpendicular

IN ANSWERING QUESTIONS 3-43 THROUGH 3-46 SELECT THE TYPE OF LINE THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

3-43. *Strength, rigidity, power and solidarity.*

1. Curved
2. Vertical
3. Diagonal
4. Horizontal

3-44. *Peace, tranquility and speed.*

1. Curved
2. Vertical
3. Diagonal
4. Horizontal

3-45. *Movement, action and speed*

1. Curved
2. Vertical
3. Diagonal
4. Horizontal

3-46. *Grace, smoothness and dignity*

1. Curved
2. Vertical
3. Diagonal
4. Horizontal

3-47. What photo composition technique provides unity and structure through repetition?

1. Pattern
2. Texture
3. Volume
4. Framing

3-48. What photo composition technique brings realism and character to an image?

1. Pattern
2. Texture
3. Volume
4. Framing

3-49. Which of the following terms best describes the relationship of objects within an image?

1. Balance
2. Harmony
3. Symmetry
4. Perspective

3-50. Which of the following types of photos is NOT an example of controlled-action?

1. Sports shot
2. Group shot
3. Studio portrait
4. Environmental shot

(This page intentionally left blank).

ASSIGNMENT 4

Textbook Assignment: “Videography”, Chapter 4.

4-1. Which of the following terms best describes the conversion of reflected light rays from a subject or scene into electrical impulses?

1. Television
2. Waveform
3. Oscilloscope
4. Studio camera

4-2. How many charge-coupled devices (CCDs) are found inside an electronic newsgathering (ENG) camera?

1. None
2. 1
3. 2
4. 3

4-3. Which of the following adjustments made to a video camera increases image contrast?

1. Gain
2. Tripod
3. Color bars
4. Neutral density filter

4-4. Which of the following situations occurs when a shot has more than one topic or center of interest?

1. Distributes focus
2. Increases interest
3. Weakens effectiveness
4. Focuses viewer's attention

4-5. Which, if any, of the following methods place a shot's center of interest in a dominant position?

1. Rule of thirds
2. Dominant factor
3. Dynamic symmetry
4. None of the above

4-6. Which of the following adjustments has the most influence on image quality?

1. AV
2. Brightness
3. Depth of field
4. Center of interest

4-7. Which of the following is NOT a factor that affects framing?

1. Noseroom
2. Headroom
3. Field of view
4. White balance

4-8. What percentage of an image is lost when shooting with most professional video cameras?

1. 5
2. 10
3. 15
4. 18

4-9. For which of the following reasons is it necessary to leave lead room for your subject when he or she is moving?

1. Reduces shadows
2. Improves audio quality
3. Ensures proper depth of field
4. Keeps subject from appearing to bump the edge of the frame

4-10. In addition to clearing your frame of unsightly objects, what other object must you pay close attention to visually in the background?

1. Cut-off points
2. Passing ships
3. A level horizon
4. Sunset lighting

IN ANSWERING QUESTIONS 4-11 THROUGH 4-14 SELECT THE VISUAL INFORMATION TERM THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

4-11. Framing issues that may make a subject appear as if her body stops at the edge of the screen.

1. Close up
2. Headroom
3. Perspective
4. Cut-off point

4-12. Apparent sense of depth based upon the relative distance and position of the subject in the frame.

1. Unity
2. Balance
3. Viewpoint
4. Perspective

4-13. Full face shot with headroom and room for the subject's shoulders.

1. Close up
2. Full length
3. Lead room
4. Headroom

4-14. The camera position in relationship to the subject.

1. Unity
2. Balance
3. Viewpoint
4. Perspective

4-15. Which of the following shooting techniques adds drama and excitement to the frame?

1. Shooting in adequate natural light
2. Shooting from different viewpoints
3. Shooting from different angles
4. All of the above

4-16. Which of the following terms best describes a video story's foundation of continuity?

1. Viewpoint
2. Basic sequence
3. Establishing shot
4. Camera angle variation

IN ANSWERING QUESTIONS 4-17 THROUGH 4-19 SELECT THE VIDEO SHOOTING TERM THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

4-17. In a shooting sequence, it introduces the scene and shows the entire area of action

1. Close up
2. Long shot
3. Medium shot
4. Camera angle

4-18. Focuses attention on an important subject or action.

1. Close up
2. Long shot
3. Medium shot
4. Camera angle

4-19. Narrows the center of interest, answering the "what" of a scene.

1. Close up
2. Long shot
3. Medium shot
4. Camera angle

4-20. When shooting a basic sequence, how much extra footage at a minimum should be included before and after the shot's main action to leave room for transitions and to ease the editing process?

1. None, time and b-roll too costly
2. 2-3 seconds
3. 5-6 seconds
4. 10 seconds

4-21. Which of the following items dictates the relative distance between shots?

1. Location
2. Transitions
3. Time of day
4. Subject matter

4-22. Which of the following reasons is the basis for always shooting on the same side of the action axis?

1. Avoid cut-off points
2. Emphasizes center of interest
3. Maintains directional continuity
4. Allows shooter to stay within basic sequence

4-23. Which of the following shooting techniques works to achieve a smooth, uninterrupted flow from one shot to another?

1. Overlapping
2. 180-degree rule
3. Basic sequencing
4. Static screen directional shooting

4-24. When shooting to achieve a smooth, uninterrupted flow of action, which of the following is NOT a factor to be considered?

1. Story
2. Dialogue
3. Control of the action
4. Indoors vs. outdoors shooting

4-25. Which of the following ways do cut-ins and cutaways preserve continuity?

1. Builds interest
2. Bridges time and distance
3. Covers changes in screen direction
4. All of the above

4-26. Which, if any, of the following events is considered semi-controlled action shooting?

1. Sports
2. Ceremonies
3. Hard-news situations
4. None of the above

IN ANSWERING QUESTIONS 4-27 THROUGH 4-32 SELECT THE MOVEMENT THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

4-27. Movement in front of the camera, usually by the talent.

1. Panning
2. Primary
3. Dollying
4. Secondary

4-28. Sequence of shots from two or more cameras.

1. Tilting
2. Tertiary
3. Panning
4. Primary

4-29. Horizontal movement on a stationary pedestal following the primary action.

1. Dollying
2. Tertiary
3. Panning
4. Primary

4-30. What type of video shot is absolutely centered and allows the shooter to cross the action axis and establish a new direction of travel?

1. Cutaway
2. Long shot
3. Neutral shot
4. Extreme long shot

4-31. Which of the following variations to the basic sequence always precedes a long shot and establishes physical character?

1. Cut-in
2. Full figure
3. Neutral
4. Extreme long shot

4-32. Which, if any, of the following variations to the basic sequence could startle, confuse or withhold information from the viewer?

1. Reverse sequencing
2. Cut-ins and cutaways
3. Extended sequencing
4. None of the above

4-33. Which of the following terms best describes the organizing of footage into smaller, more manageable files?

1. Continuity
2. Digitizing
3. Sequencing
4. Sub-clipping

4-34. Which of the following terms best describes the orderly structuring of facts, ideas and abstract suggestions during the editing process?

1. Continuity
2. Digitizing
3. Sequencing
4. Sub-clipping

4-35. Which of the following devices is NOT associated with the most commonly used method of video editing?

1. Cut-in
2. Cutaway
3. Crosscutting
4. Compilation

(This page intentionally left blank).

ASSIGNMENT 5

Textbook Assignment: “Multimedia”, Chapter 5.

5-1. Which of the following MC skills can be incorporated into a multimedia production?

1. Writing
2. Photography
3. Layout and design
4. All of the above

5-2. What happens to the quality of a) raster images and b) vector images when you increase their size?

1. a) decreases b) decreases
2. a) nothing b) decreases
3. a) decreases b) nothing
4. a) nothing b) nothing

5-3. Which of the following items should NOT be edited using vector-based software?

1. Charts
2. Drawings
3. Diagrams
4. Photographs

5-4. Which of the following actions helps improve multimedia production skills?

1. Practice
2. Experimenting
3. Reading graphics software manuals
4. All of the above

IN ANSWERING QUESTIONS 5-5 THROUGH 5-9 SELECT THE VECTOR TERM FROM THE LIST BELOW THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

- | | |
|-----------|-----------------|
| A. Fill | D. Miter Limit |
| B. Path | E. Anchor Point |
| C. Stroke | F. Bézier Curve |

5-5. The basis for all vector drawings.

1. B
2. D
3. E
4. F

5-6. A tracing around an object that can be colored or patterned.

1. A
2. C
3. E
4. F

5-7 Adds color or pattern to an open area.

1. A
2. B
3. C
4. D

5-8. *A shape formed by lines collected at a point.*

1. B
2. D
3. E
4. F

5-9. *Which of the following instructions dictates policy for the marking and filing of all Navy graphics?*

1. OPNAVINST 3432.1
2. SECNAVINST 3104.1
3. CHINFOINST 5230.16
4. SECNAVINST 5720.44

5-10. *Which of the following terms best describes the actual placement of items on a page as well as the relationships among the items?*

1. Perspective
2. Layout and design
3. Multiple-page layout
4. Raster-graphic design

IN ANSWERING QUESTIONS 5-11 THROUGH 5-14 SELECT THE TERM THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

5-11. *Demonstrates movement and communicates feeling or mood?*

1. Unity
2. Balance
3. Rhythm
4. Emphasis

5-12. *Visual cues to tell the reader what elements belong together on a page.*

1. Unity
2. Balance
3. Rhythm
4. Emphasis

5-13. *Equal distribution of weight from the elements on a page.*

1. Unity
2. Balance
3. Rhythm
4. Emphasis

5-14. *Highlights one element over another, capturing the reader's attention.*

1. Unity
2. Balance
3. Rhythm
4. Emphasis

5-15. *Which of the following examples DOES NOT create unity in a layout?*

1. Kerning
2. Leading
3. Spacing
4. Grouping

5-16. *Horizontal lines in a layout communicate which of the following messages?*

1. Strength
2. Elegance
3. Movement
4. Relaxation

5-17. Curved lines in a layout communicate which of the following messages?

1. Strength
2. Elegance
3. Movement
4. Relaxation

5-18. In which of the following ways does using shapes enhance a layout?

1. Sustains interest
2. Organizes elements
3. Provides a starting point
4. All of the above

5-19. Which of the following items is considered an abstract shape?

1. Tree
2. Circle
3. Square
4. Handicap symbol

5-20. Which of the following design terms BEST describes the space between and around items in a layout?

1. Gutter
2. Galley
3. Leading
4. White space

5-21. What type of mood is created by using high-contrast colors in a layout?

1. Calming
2. Instability
3. Confusion
4. Excitement

5-22. Which of the following design elements is considered the ultimate tool for symbolic communication?

1. Size
2. Color
3. Shape
4. Texture

5-23. What is the main purpose of a good design layout?

1. Directs reader's attention
2. Conveys intended message
3. Aesthetically pleasing to the eye
4. All of the above

5-24. A 72-point headline is of what vertical length?

1. ¼ inch
2. ½ inch
3. 1 inch
4. 1 ½ inches

5-25. What, if any, of the following occurs when tight leading is used within your layout?

1. Fills the page
2. Airs out sentences
3. Decreases legibility
4. None of the above

5-26. What is the target line length for optimal readability?

1. 10 characters
2. 25 characters
3. 55 characters
4. 100 characters

5-27. What is the minimum point size you should use for text in a layout?

1. 7
2. 8
3. 10
4. 12

5-28. Times New Roman is an example of what design element?

1. Stroke
2. Kerning
3. Typeface
4. San serif font

5-29. What are the three types of indentions used in layouts?

1. Flush, hanging and regular
2. Flush, pulled and regular
3. Hanging, pulled and regular
4. Hanging, kerned and pulled

IN ANSWERING QUESTIONS 5-30 THROUGH 5-34 SELECT THE DESIGN ELEMENT THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

5-30. Invisible structure used to provide visual organization during layout process.

1. Grid
2. Gutter
3. Border
4. White space

5-31. Horizontal or vertical line used to offset areas on a layout.

1. Rule
2. Bleed
3. Border
4. Grid system

5-32. Photo or illustration that extends beyond a page margin.

1. Rule
2. Bleed
3. Gutter
4. Border

5-33. Decorative line or box used to give the layout an organized appearance.

1. Grid
2. Rule
3. Gutter
4. Border

5-34. Blank space between to facing pages.

1. Grid
2. Rule
3. Gutter
4. Border

5-35. Which of the following steps should be the first taken during the development of an electronic presentation?

1. Design
2. Testing
3. Planning
4. Production

5-36. Which, if any, of the following factors are the most important to consider when creating an electronic presentation?

1. Text and color
2. Number of slides
3. Simplicity and legibility
4. None of the above

5-37. What type of graphical relationship is created by using only one family of type in an electronic presentation?

1. Conflicting
2. Contrasting
3. Concordant
4. Combination

5-38. What type of graphical relationship is created by using separate, but clearly distinct, typefaces in an electronic presentation?

1. Conflicting
2. Contrasting
3. Concordant
4. Combination

5-39. Which of the following typefaces are recommended for use in electronic presentations?

1. Serif only
2. Slab-serif only
3. Sans-serif only
4. Slab-serif and sans-serif

5-40. Which of the following guidelines should be followed when creating presentation slides?

1. All caps for text
2. Three topics per slide
3. Six lines per slide, six words per line
4. All of the above

5-41. On average, what amount of time does a viewer spend reading each slide?

1. 2-second glance
2. 5 seconds
3. 7 seconds
4. 15 seconds

5-42. Which of the following types of color is best suited for use on slide backgrounds, when you want to create a receptive and passive atmosphere for your audience?

1. Cool colors
2. Warm colors
3. Bright colors
4. Neutral colors

5-43. Which of the following guidelines should be followed when using and deciding upon colors for your electronic presentation?

1. Avoid red-green combinations
2. Use bright colors for emphasis
3. Establish color palette and stick to it
4. All of the above

IN ANSWERING QUESTIONS 5-44 THROUGH 5-45 SELECT THE PRINCIPLE OF DESIGN FOR PRESENTATIONS THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

5-44. Major cause of unappealing layouts.

1. Contrast
2. Proximity
3. Alignment
4. Repetition

5-45. Most important visual attraction for electronic presentations.

1. Contrast
2. Proximity
3. Alignment
4. Repetition

5-46. When developing graphics for your electronic presentation to be given via an overhead projector, what concentration of dots per inch should you strive for?

1. 72
2. 150
3. 300
4. 600

IN ANSWERING QUESTIONS 5-47 THROUGH 5-49 SELECT THE MOVIE AUTHORING STAGE THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

5-47. Development of story line and writing of the script.

1. Design
2. Testing
3. Planning
4. Concept

5-48. Question-and-answer stage needed to establish the project and its purpose.

1. Design
2. Testing
3. Planning
4. Concept

5-49. Stage during which members of your intended audience review the product.

1. Design
2. Testing
3. Planning
4. Concept

5-50. Which of the following terms describes a type of multimedia production that is interactive, such as with computer-based training and games?

1. Linear
2. Nonlinear
3. Horizontal
4. Perpendicular

5-51. Which of the following terms best describes the process of filling the frames between the main points of action for fluidity in an animated production?

1. Keying
2. Walking
3. Morphing
4. Tweening

5-52. Which of the following Navy policies is the governing instruction for the maintenance and development of websites?

1. OPNAVINST 5040.05
2. OPNAVINST 5112.3
3. SECNAVINST 3104.1
4. SECNAVINST 5724.27

5-53. Which of the following terms best describes the unique address given to the location of a file on the Internet?

1. File transfer site
2. Domain name server
3. Internet protocol address
4. Uniform resource locator

5-54. During which stage of website creation would you use drawings, flowcharts and storyboards to map out ideas for pages?

1. Design
2. Concept
3. Planning
4. Production

5-55. Which of the following guidelines is a best practice when deciding upon text and where to place it on your website?

1. Use all caps
2. Center all text
3. Left-justify body text; center titles
4. Use common acronyms to save space and keep the page clean and simple

5-56. Which of the following guides should you adhere to when placing graphics on your website?

1. Keep images at 300 dpi
2. Do not compress images
3. Reduce images for quicker downloading
4. Only link to images on Navy.mil

5-57. Which of the following sections of the 1973 Rehabilitation Act established requirements for the public access to electronic information and information technology for people with disabilities?

1. Section 501
2. Section 503
3. Section 505
4. Section 508

(This page intentionally left blank).

ASSIGNMENT 6

Textbook Assignment: *"Print Production", Chapter 6.*

6-1. Who is credited with inventing the mechanical moveable-like printing press?

1. Martin Cooper
2. Chester Carlson
3. George Eastman
4. Johannes Gutenberg

6-2. Which of the following is NOT a basic category of desktop publishing software?

1. Digital
2. Layout
3. Graphics
4. Composition

6-3. What type of desktop printer sprays electrically charged ink through tiny nozzles to form an image of high-quality resolution?

1. Laser
2. Inkjet
3. Thermal-dye
4. Digital duplicator

6-4. What type of desktop printer uses thousands of tiny heating elements that come into contact with donor ribbons to release color?

1. Laser
2. Inkjet
3. Thermal-dye
4. Digital duplicator

6-5. Which of the following terms best describes the high-speed printing system designed for high-volume photocopying and printing?

1. Laser
2. Inkjet
3. Thermal-dye
4. Digital duplicator

IN ANSWERING QUESTIONS 6-6 THROUGH 6-8 SELECT THE CHARACTERISTIC OF PAPER THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

6-6. Determined by the type of pulp used, treatments and end use for the paper.

1. Finish
2. Grade
3. Basis weight
4. Paper density

6-7 Texture of the paper

1. Finish
2. Grade
3. Basis weight
4. Paper density

6-8. Measurement of paper's compactness (how much light the paper lets in).

1. Finish
2. Grade
3. Basis weight
4. Paper density

6-9. Which of the following actions should you take when you begin to notice defective prints when using a digital duplicator?

1. Change the print color
2. Replace the master roll
3. Clean the thermal print head
4. Change the print density setting

6-10. Which of the following types of scanners has the capability of scanning three-dimensional objects?

1. Slide scanner
2. Hand scanner
3. Flatbed scanner
4. Copystand scanner

6-11. Which of the following types of scanners has the capability for small-quantity scanning?

1. Slide scanner
2. Hand scanner
3. Flatbed scanner
4. Copystand scanner

6-12. Which of the following is another term used synonymously with the knife angle of a paper cutter?

1. Draft
2. Bevel
3. Snubber
4. Cutting stick

6-13. Which of the following items keeps a paper cutter's knife from dulling too easily or breaking every time it's used?

1. Draft
2. Bevel
3. Snubber
4. Cutting stick

6-14. Which of the following terms best describes the metal bar that runs parallel to the knife that holds paper firmly in place during cutting?

1. Stock slide
2. Back gauge
3. Cutter clamp
4. Thumbscrew

6-15. Which of the following is NOT a common fold of paper used in print production?

1. Gate
2. French
3. Tabletop
4. Accordion

IN ANSWERING QUESTIONS 6-16 THROUGH 6-19 SELECT THE BINDING METHOD THAT BEST MATCHES THE DESCRIPTION GIVEN AS THE ANSWER.

6-16. Also known as padding, this method makes tablets or pads by cementing the edge of a stack of paper sheets.

1. Adhesive
2. Mechanical
3. Thread-sewing
4. Saddle-stitching

6-17. *Allows for flat binding and uses coils, combs or metal rings to join sheets of paper.*

1. Adhesive
2. Mechanical
3. Thread-sewing
4. Saddle-stitching

6-18. *Uses staples through the centerfold along the backbone of brochures or thin magazines?*

1. Adhesive
2. Mechanical
3. Thread-sewing
4. Saddle-stitching

6-19. *Most expensive binding process, usually reserved for fine literature and reference books?*

1. Adhesive
2. Mechanical
3. Thread-sewing
4. Saddle-stitching

6-20. *Which of the following terms describes the type of mat cutter used in photo matting?*

1. Emery
2. Carriage
3. Guillotine
4. Precision

6-21. *Which of the following describes a major difference between matting and mounting a print for display?*

1. Matting enhances the image
2. Matting is only used for photographs
3. A matted print is a protected print
4. A matted print is placed behind a cut opening; the mat surrounds the print

6-22. *In which of the following print-mounting methods is the bond often temporary?*

1. Dry
2. Wet
3. Porous
4. Pressure

6-23. *Which of the following rules IS NOT in adherence to the Counterfeit Act of 1992 for the use of money in illustrations?*

1. The illustration must be one-sided
2. The illustration must be an actual-size duplication of the actual currency
3. The illustration must be less than 3/4s or more than 1 ½ the size of the actual currency
4. All files used in the making of the illustration must be destroyed following use

6-24. *In what policy guidance will you find the Navy Visual Information Management and Operations Manual?*

1. OPNAVINST 3104.1
2. CHINFOINST 5720.8
3. DoD Directive 5040.02
4. SECNAVINST 5720.44

6-25. What is the purpose of a mandatory job order log used to track visual information products?

1. Inventory materials used
2. Maintain close control of services
3. Provide receipt for finished works
4. All of the above

ASSIGNMENT 7

Textbook Assignment: “File Management and Transmission”, Chapter 7.

7-1. Who assigns the Visual Information Record Identification Number (VIRIN)?

1. Defense Imagery Management Operations Center (DIMOC)
2. The originator
3. Navy Visual News Service (NVNS)
4. Chief of Information (CHINFO)

7-2. You are preparing a VIRIN for the third photograph shot on April 4, 2011. Which of the following examples is in the proper format?

1. 040411-N-SQ684-003
2. 110404-N-SQ684-001
3. 110404-M-SQ684-003
4. 110404-N-SQ684-003

7-3. How many data elements does a VIRIN consist of?

1. 4
2. 5
3. 13
4. 15

IN ANSWERING QUESTIONS 7-4 THROUGH 7-7 MATCH THE FIELD FROM THE LIST THAT MATCHES THE DESCRIPTION GIVEN AS THE ANSWER

- | | |
|------------|------------|
| A. Field 1 | C. Field 3 |
| B. Field 2 | E. Field 4 |

7-4. The year, month and day of acquisition or origination

1. B
2. D
3. A
4. C

7-5. The originator's Vision ID code

1. A
2. C
3. D
4. B

7-6. The image or unit of media number in sequential order

1. C
2. D
3. B
4. A

7-7. The service affiliation or status of the camera operator or originator

1. C
2. A
3. D
4. B

7-8. What information should be included on a VIRIN slate for a video?

1. Videographer name and rank
2. Brief description of the sequence
3. Release status of the video
4. All of the above

7-9. Which form is used for writing captions for motion imagery?

1. DD Form 10700
2. DD Form 2537
3. DD Form 1348
4. DD Form 2533

7-10. What are the two types of captions for video?

1. Total and Sequence
2. Sequential and Total
3. Sequence and Shot
4. Total and Shot

7-11. Which video caption type describes the contents of the entire video sequence?

1. Total
2. Sequential
3. Shot
4. Sequence

7-12. If system software does not support long file names, what information should the file name include?

1. Date in VIRIN format and last two characters of the sequence number
2. Date in VIRIN format and Vision ID
3. Description of the image or video
4. None of the above

7-13. Which file format is organized into alternating ("interleaved") chunks of audio and video data used for storing and playing back movie clips with sound on Windows™-based PCs?

1. MOV
2. DV
3. AVI
4. GIF

7-14. Which software takes a raw data file and turns it into a compressed file?

1. TIFF
2. RAW
3. CODEC
4. MIDI

7-15. Which file format is optimized for photographs and similar continuous tone images that contain many, many colors?

1. JPEG
2. GIF
3. MPEG1
4. BMP

7-16. What describes the average amount of data required to store one second of music, expressed in kilobits per second, or Kbps, with audio compression?

1. FTP
2. Bitrate
3. FFT
4. CODEC

7-17. Which file format is a flexible MPEG container format used for both streaming and downloadable Web content?

1. MP3
2. MPEG1
3. MPEG2
4. MPEG4

7-18. Which file format is a flexible container format for digital still images, commonly used in desktop publishing?

1. GIF
2. TIFF
3. MOV
4. JPEG

7-19. Which file format is a standard audio format for Windows™ operating systems, often used for storing high-quality, uncompressed sound?

1. AIFF
2. MIDI
3. MP3
4. WAV

7-20. Which file format employs a lossy compression system and is the most popular codec for storing and transferring music ?

1. MP3
2. WAV
3. MIDI
4. WMV

7-21. What is metadata?

1. File format commonly used to compress data for desktop publishing
2. File that contains commands that let MIDI-capable synthesizers recreate a specific musical passage
3. Pertinent information about the image embedded into the image's file information
4. Uniform copyright protection protocol that would work with a variety of digital players, software programs, and download sites

7-22. What information is contained in metadata?

1. Contact Information
2. Caption
3. Keywords about the photograph
4. All of the above

7-23. Which of the following is a preferred method to transfer image and video files to DIMOC?

1. Federal Express
2. E-mail
3. FTP
4. Social media site

7-24. Which client-server based transmission application allows users to routinely transmit large computer files using Windows based computers over IP-based networks?

1. FFT
2. HTTPS
3. HTTP
4. FTP

7-25. How should you keep information that is extremely valuable to our enemies?

1. Censored and classified
2. Classified and safeguarded
3. Uncensored and unclassified
4. Unclassified and safeguarded

7-26. What policy governs the safeguarding of classified material in the Navy?

1. OPNAVINST 5510.1(series)
2. SECNAVINST 5216.5(series)
3. SECNAVINST 5720.44(series)
4. OPNAVINST 3104.1(series)

Graphic Design and Print Production Fundamentals

Graphic Design and Print Production Fundamentals

Accessibility Statement

BCcampus Open Education believes that education must be available to everyone; this means supporting the creation of free, open, and accessible educational resources. We are actively committed to increasing the accessibility and usability of the textbooks we produce.

Accessibility features of the web version of this resource

The [web version of *Graphic Design and Print Production Fundamentals*](#) includes the following features:

- It has been optimized for people who use screen-reader technology:
 - all content can be navigated using a keyboard
 - links, headings, tables use proper markup
 - all images have text descriptions
- It includes an option to increase font size. (See tab on top right of screen titled, “Increase Font Size.”)

Other file formats available

In addition to the web version, this book is available in a number of file formats including PDF, EPUB (for eReaders), MOBI (for Kindles), and various editable files. Here is a link to where you can [download this book in another file format](#). Look for the Download this book drop-down menu to select the file type you want.

Known accessibility issues and areas for improvement

There are no known accessibility issues at this time.

Let us know if you are having problems accessing this book

If any of the above accessibility issues are stopping you from accessing the information in this textbook, please contact us to let us know and we will get it fixed. If you discover any other issues, please let us know of those as well.

Please include the following information:

x Graphic Communications Open Textbook Collective

- The location of the problem by providing a web address or page description
- A description of the problem
- The computer, software, browser, and any assistive technology you are using that can help us diagnose and solve your issue
e.g., Windows 10, Google Chrome (Version 65.0.3325.181), NVDA screen reader

You can contact us through the following form: [Report an Open Textbook Error](#)

Help us improve the accessibility of our resources

Are you interested in helping us make more of our textbooks accessible? If you have Pressbooks experience, a basic knowledge of web accessibility guidelines, and some time your are willing to volunteer, we would love some help as we have a number of textbooks that need remediation work. [Contact us](#).

About BCcampus Open Education

Graphic Design and Print Production Fundamentals was created by the Graphic Communications Open Textbook Collective. This creation is a part of the B.C. Open Textbook project.

[BCcampus Open Education](#) began in 2012 as the B.C. Open Textbook Project with the goal of making post-secondary education in British Columbia more accessible by reducing student costs through the use of openly licensed textbooks and other OER. [BCcampus](#) supports the post-secondary institutions of British Columbia as they adapt and evolve their teaching and learning practices to enable powerful learning opportunities for the students of B.C. BCcampus Open Education is funded by the [British Columbia Ministry of Advanced Education, Skills & Training](#), and the [Hewlett Foundation](#).

Open textbooks are open educational resources (OER) created and shared in ways so that more people have access to them. This is a different model than traditionally copyrighted materials. OER are defined as teaching, learning, and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use and re-purposing by others.¹ Our open textbooks are openly licensed using a [Creative Commons licence](#), and are offered in various e-book formats free of charge, or as printed books that are available at cost. For more information about open education in British Columbia, please visit the [BCcampus Open Education](#) website. If you are an instructor who is using this book for a course, please fill out our [Adoption of an Open Textbook](#) form.

Introduction

Ken Jeffery

Figure I.1 Car graphics are an example of modern day print design

On any given day, you can look around your surroundings and come in contact with print design. Information comes to you in many forms: the graphics on the front of a cereal box, or on the packaging in your cupboards; the information on the billboards and bus shelter posters you pass on your way to work; the graphics on the outside of the cup that holds your double latte; and the printed numbers on the dial of the speedometer in your car. Information is communicated by the numbers on the buttons in an elevator; on the signage hanging in stores; or on the amusing graphics on the front of your friend's T-shirt. So many items in your life hold an image that is created to convey information. And all of these things are designed by someone.

Figure I.2 Times Square has many examples of print design

Traditionally referred to as graphic design, communication design is the process by which messages and images are used to convey information to a targeted audience. It is within this spectrum that this textbook will address the many steps of creating and then producing physical, printed, or other

imaged products that people interact with on a daily basis. Design itself is only the first step. It is important when conceiving of a new design that the entire workflow through to production is taken into consideration. And while most modern graphic design is created on computers, using design software such as the Adobe suite of products, the ideas and concepts don't stay on the computer. To create in-store signage, for instance, the ideas need to be completed in the computer software, then progress to an imaging (traditionally referred to as printing) process. This is a very wide-reaching and varied group of disciplines. By inviting a group of select experts to author the chapters of this textbook, our goal is to specifically focus on different aspects of the design process, from creation to production.

Each chapter begins with a list of Learning Objectives, and concludes with Exercises and a list of Suggested Readings on the Summary page. Throughout, key terms are noted in bold and listed again in a [Glossary](#) at the end of the book.

In [Chapter 1](#), we start with some history. By examining the history of design, we are able to be inspired by, and learn from, those who have worked before us. Graphic design has a very rich and interesting heritage, with inspirations drawn from schools and movements such as the Werkbund, Bauhaus, Dada, International Typographic Style (ITS), as well as other influences still seen in the designs of today.

Figure 1.3 Johannes Itten was a designer associated with the Bauhaus school

We now work in an age where the computer has had an influence on the era of Post Modernism. Is this a new age? Are we ushering in an era unseen before? Or are modern-day designs simply a retelling of the same tropes we have seen for hundreds of years?

[Chapter 2](#) follows with a discussion about the design process. Contrary to what we tend to see in popular television shows and movies where advertising executives are struck with instant, usable, and bold ideas, design strategies are seldom insights gained through such a sudden outburst of inspiration. The design process is a deliberate, constructive, and prescriptive process that is guided by specific strategies. For example, before any piece of designed communication can be started, some very detailed research needs to be performed. This happens well before any graphic design or layout software is opened on a computer. Designing is a form of problem solving, where a system is created to communicate a specific

and targeted message. The design process is the way that a designer breaks the problem into discrete creative activities. First is an exploration of what is trying to be achieved. Facts are gathered about the problem, and the problem itself is often defined very specifically. The idea phase is where brainstorming and ideation occurs, often without judgment, as a way to gather as many different ideas and directions as possible. From this, solutions are evaluated, both for their perceived impact on the target audience and for their perceived effectiveness in portraying the desired message. Finally, all of this information is distilled into an accepted solution. Designers do not sit around waiting for ideas to just happen; they follow a process in order to make it happen.

Figure I.4 The golden ratio is a constant that appears in nature

[Chapter 3](#) presents the most important and necessary design elements required for effective graphic layout and design. When designing a layout, the designer cannot just ‘throw’ all of the information onto the page. Design is a thoughtful process that makes use of many different skills to create a design that is both appealing and legible. We discuss the grid in its many forms, including different types of grid such as the ITS grid, the golden ratio, and even strategies for using no grid at all. Space is an important design element, with different items on the page requiring more or less area to be effective. We also talk about the density, or ‘colour’ of type on the page, along with a number of different typographical conventions for making the most of the collection of words on the layout.

In [Chapter 4](#), we begin to move along in the production process and discuss some of the more physical attributes of design. And one of the most important topics in creating printed products is that of colour. It is a complex part of the design process, affecting how an image is transmitted to the eye, how the colours are perceived, and what makes one thing look different from another, even if it is the same colour. Have you ever printed something on your home printer only to be disappointed that it doesn’t look like it did on your computer screen? Highly detailed systems of colour management are put in place to mitigate these differences.

As we proceed toward creating printed output, [Chapter 5](#) is where it all starts to come together. In the print process, this stage is called prepress. Prepress is where all the design work is translated from a file on the computer in front of you into a form that can be ‘printed’ onto a given surface. Imagine the requirements for creating not just one copy of a design, but thousands! This is a very important step, and if mistakes or production hurdles are not discovered and overcome at this step, then the project can end up being very costly for all parties involved, from the designer, to the printer, to the client. This chapter deals with topics such as preflight, imposition, separations, platemaking, and considerations for other print and finishing processes.

[Chapter 6](#) is a comprehensive look at how all of this design work will result in a finished product. The many ways that a design can be printed are varied and complex, but having some knowledge about how the print process works will help to create a more successful project. Is it going to be printed on a box, or on a billboard? How many copies are needed: one or one million? These and many more decisions influence how a product will be produced. This chapter outlines some of the more popular printing technologies, along with industry standard procedures for working with them. Suggestions for choosing the right paper (or other types of **substrates**) are also made along with best practices for working with colour on the printed page.

[Chapter 7](#) rounds out this textbook with a look at online technologies and how they affect, and are affected by, the printed word. We examine online web-to-print solutions and their contribution to bridging the process from graphic design to printed work. We also highlight other considerations such as branding and digital file resolution strategies. As the world has moved into an Internet-connected, always-on compendium of information, print remains a vital, relevant, and important part of the media mix. Effective communication campaigns make the most of *all* opportunities that media design and, in particular, print design can offer.

The goal of this text is to bridge the disciplines of communication design and print production to form a concise, accessible compendium outlining the design process in this modern, computer-driven age. While it is common, or perhaps easy, to surmise that graphic design is solely a computer-driven pursuit, when we take a step back, and look at the entire process, we see that computer-aided design is only one part of a larger picture. And by including this larger domain in our studies, we can truly gain an appreciation for the influences and strategies needed to be successful in this field.

Chapter 1. Design History

1.1 Introduction

Alex Hass

Learning Objectives

- Identify the unique attributes of major modern graphic design styles, beginning with William Morris. The design styles discussed will be those that have a presence or an influence in our current visual culture:
 - Morris
 - Werkbund
 - Bauhaus
 - Dada
 - International Typographic Style (ITS)
 - Late Modern
 - Post Modern
- Evaluate the influence of past design styles on one another
- Explain the influence of culture on major modern graphic design styles
- Identify the cross-cultural influences of visual culture that impacted graphic design style
- Identify the technological influences that affected and advanced graphic design

Industrial Revolution Overview

The Craftsman

Before the Industrial Revolution (1760-1840 in Britain) most aspects of design and all aspects of production were commonly united in the person of the craftsman. The tailor, mason, cobbler, potter, brewer, and any other kind of craftsman integrated their personal design aesthetic into each stage of product development. In print, this meant that the printer designed the fonts, the page size, and the layout of the book or broadsheet; the printer chose (even at times made) the paper and ran the press and bindery. Unity of design was implicit.

Typography in this pre-industrial era was predominantly used for books and broadsheets. The visual flavour of the fonts was based on the historic styles of western cultural tradition — roman, black letter, italic, and grotesque fonts were the mainstay of the industry. Typography was naturally small scale

— needed only for sheets and pages — and was only large when it was chiseled into buildings and monuments.

Technological Shift

The Industrial Revolution radically changed the structure of society, socially and economically, by moving vast numbers of the population from agrarian-based subsistence living to cities where manufacturing anchored and dominated employment and wealth. Agrarian-based society was tied to an aristocracy overseeing the land and controlling and directing production through the use of human labour. In contrast, urban production, though still very much in need of human labour (female and child labour in particular was in huge demand), was dominated by the mechanized production of goods, directed and controlled by industrialists instead of the aristocracy. The factories were powered initially by steam, and eventually by gasoline and electricity. These new manufacturing models were dominated by an engineering mentality that valued optimization of mechanical processes for high yields and introduced a compartmentalized approach to production.

Design and Production Separate

The design process was separated from the production-based process for a number of reasons. Primary was the efficiency-oriented mindset of the manufacturers who were focused on creating products with low unit costs and high yield outcomes, rather than on pleasing aesthetics or high-quality materials. Design process is time consuming and was considered unnecessary for each production stage of manufactured goods.

Manufactured products were intended for the working and middle classes, and high-quality output was not a goal. These products were never intended to vie for the attention of the upper classes — enticing them away from the services and bespoke products of the craftsman (a contemporary example is Tip Top Tailors attracting Savile Row customers). Rather, they supplied common people with goods they had not been able to afford before. This efficient line of thinking created the still existing equation of minimal design plus low material integrity equalling low-cost products.

Design, rather than being a part of each step of production (implicit in the craftsman's approach), was added for form development and when a product needed more appeal for the masses — usually during the later stages of production through decorative additions. Design was now directed by the parameters and constraints of the manufacturing process and its needs.

Advertising Emerges

Despite low product standards, the high quantities and low costs of manufactured goods “stimulated a mass market and even greater demand” (Meggs & Purvis, 2011, p. 127). The historic role of graphic design for broadsheets and books expanded at this point to include advertising. Each company and product needed exposure to sell these manufactured products to the mass market — no earlier method of promotion could communicate to this number of people.

The design aesthetic of these times was relatively untouched by stylistic cohesion or design philosophy. Industrialists used a pastiche of historic styles that aspired to make their products look more upscale,

but did not go as far as to create a new visual language. This was a strategy that made sense and has since been repeated (consider early computer design aesthetics). Usually, when a new medium or communication strategy is developed (advertising in print and the posters of the Industrial Revolution), it uses visual and language styles that people are already familiar with, and introduces a new way to deliver the message. Too much change alienates, but novelty of delivery works by adding a twist on the shoulders of an already familiar form.

Font Explosion

In addition to its new role in promoting products to the mass market, graphic design moved forward with an explosion of new font designs as well as new production methods. The design of fonts had earlier been linked to the pragmatic and cultural objectives of producing books and broadsheets. With large format posters and numerous other print components, text needed to do much more than represent a phonetic symbol. Innovations in production affected — perhaps infected — printers with the pioneer spirit of the times, and all products and their potential were examined and re-evaluated. This attitude naturally included the function and design of fonts and the methods used to reproduce them. Text was often the only material used to promote its subject and became integral to a visual communication. Jobbing printers who used either letterpress or lithographic presses pushed the boundaries of both, competing with each other by introducing innovations and, in turn, pushing artists and type foundries to create more products they could use. An entirely new font category, slab serif — sometimes called Egyptian — was created. Thousands of new fonts emerged to meet the demand of the marketplace.

Photography

In addition to font development, the Industrial Age also contributed the photograph and ultimately its use in books and advertising. Photography (for print design) was originally used as a research tool in developing engravings, but this was costly and time consuming. Numerous inventors searched for ways to integrate photography into the press process since the early years of its development in the 1830s. Photo engraving eventually arrived in 1871 using negatives and plates. From that time forward, photography has been used to conceptually and contextually support the communication of graphic design in its many forms.

1.2 William Morris and the Arts & Crafts Movement

Alex Hass

Conditions and Products of the Industrial Age

The Arts & Crafts movement emerged in the second half of the 19th century in reaction to the social, moral, and aesthetic chaos created by the Industrial Revolution. William Morris was its founder and leader. He abhorred the cheap and cheerful products of manufacturing, the terrible working and living conditions of the poor, and the lack of guiding moral principles of the times. Morris “called for a fitness of purpose, truth to the nature of the materials and methods of production, and individual expression by both artist and worker” (Meggs & Purvis, 2011, p. 160). These philosophical points are still pivotal to the expression of design style and practice to this day. Design styles from the Arts & Crafts movement and on have emphasized, in varying degrees, either fitness of purpose and material integrity, or individual expression and the need for visual subjectivity. Morris based his philosophy on the writings of John Ruskin, a critic of the Industrial Age, and a man who felt that society should work toward promoting the happiness and well-being of every one of its members, by creating a union of art and labour in the service of society. Ruskin admired the medieval Gothic style for these qualities, as well as the Italian aesthetic of medieval art because of its direct and uncomplicated depiction of nature.

Many artists, architects, and designers were attracted to Ruskin’s philosophy and began to integrate components of them into their work. Morris, influenced by his upbringing in an agrarian countryside, was profoundly moved by Ruskin’s stance on fusing work and creativity, and became determined to find a way to make it a reality for society. This path became his life’s work.

Pre-Raphealite Brotherhood

Morris met Edward Burne-Jones at Exeter College when both were studying there. They both read extensively the medieval history, chronicles, and poetry available to them and wrote every day. Morris published his first volume of poetry when he was 24, and continued to write and publish for the rest of his life. After graduation, Morris and Burne-Jones tried a few occupations, and eventually decided to become artists. Both became followers of Dante Gabriel Rossetti who founded the Pre-Raphealite brotherhood that was based on many of Ruskin’s principles. Morris did not last long as a painter, eventually finding his design vocation while creating a home for himself and his new wife (Rossetti’s muse and model).

Discovering the lack of design integrity in Victorian home furnishings and various additional deficiencies in other aspects of home products, he chose to not only design his home, but all its furniture, tapestries, and stained glass.

Morris & Co.

In 1860, Morris established an interior design firm with friends based on the knowledge and experiences he had in crafting and building his home. He began transforming not only the look of home interiors but also the design studio. He brought together craftsmen of all kinds under the umbrella of his studio and began to implement Ruskin's philosophy of combining art and craft. In Morris's case, this was focused on making beautiful objects for the home. The craftsmen were encouraged to study principles of art and design, not just production, so they could reintegrate design principles into the production of their products. The objects they created were made and designed with an integrity a craftsman could feel proud of and find joy in creating, while the eventual owner would consider these products on par with works of art (an existing example is the Morris chair). The look of the work coming out of the Morris studio was based specifically on an English medieval aesthetic that the British public could connect to. The English look and its integrity of production made Morris's work very successful and sought after. His organizational innovations and principled approach gained attention with craftsmen and artisans, and became a model for a number of craft guilds and art societies, which eventually changed the British design landscape.

William Morris and the Kelmscott Press

Morris's interest in writing never waned and made him acutely aware of how the book publishing industry had been negatively affected by industrialization. One of his many pursuits included the revitalization of the book form and its design components through the establishment of the Kelmscott Press. The press was created in 1888 after Morris, inspired by a lecture about medieval manuscripts and incunabula publications, began the design of his first font, Golden, which was based on the Venetian roman face created originally by Nicolas Jenson.

In his reinterpretation of this earlier font, Morris strove to optimize readability while retaining aesthetic integrity — in the process reviving interest in font design of earlier periods. Morris used this font in his first book, *The Story of Glittering Plain*, which he illustrated, printed, and bound at his press. The design approach of this publication and all others Kelmscott produced in its eight years was based on recreating the integrated approach and beauty of the incunabula books and manuscripts of the medieval period. All aspects of the publication were considered and carefully determined to create a cohesive whole. The press itself used hand-operated machinery, the paper was handmade, and the illustrations, fonts, and page design were all created and unified by the same person to make the book a cohesive, beautiful object of design. Morris did not wholly reject mechanization, however, as he recognized the advantages of mechanical process. He considered, redesigned, and improved all aspects of design and production to increase physical and aesthetic quality.

Kelmscott Press produced over 18,000 volumes in the eight years of its existence and inspired a revival of book design on two continents. In addition, Morris inspired a reinterpretation of design and design practice with his steadfast commitment to Ruskin's principles. Future generations of designers held to Morris's goals of material integrity — striving for beautiful utilitarian object design and carefully considered functionality.

1.3 Deutscher Werkbund

Alex Hass

In the early years of the 20th century, the German Hermann Muthesius returned to Germany from England with Morris's Arts & Crafts concepts. Muthesius published the *The English House* in 1905, a book wholly devoted to the positive outcomes of the English Arts & Crafts movement. Muthesius was a sometime cultural ambassador, possibly an industrial spy, for Germany in England. His interest in the Arts & Crafts movement was not based on returning German culture to the romantic values of an earlier pre-manufacturing era. He was focused on infusing the machine-made products of Germany with high-quality design and material integrity. Muthesius believed manufacturing was here to stay. He was one of the original members of the state-sponsored Deutscher Werkbund — an association that promoted the union of art and technology. The Werkbund integrated traditional crafts and industrial mass-production techniques, and put Germany on a competitive footing with England and the United States. Its motto “Vom Sofakissen zum Städtebau” (from sofa cushions to city-building) reveals its range.

Design Embraces the Manufacturing Process

Peter Behrens and Henry van de Velde were also part of the original leadership, and with Muthesius developed the philosophy of *Gesamtkultur* — a cohesive cultural vision where design was the driving force of a wholly fresh, man-made environment. Every aspect of the culture and its products was examined and redefined for maximum use of mechanization in its production. The new visual language of *Gesamtkultur* was a style stripped of ornament in favour of simplicity and function. All areas of cultural production were affected by this new philosophy — graphic design, architecture, industrial design, textiles, and so forth — and all were reconfigured and optimized. Sans serif fonts dominated the reductive graphic design style as did standardization of sizes and forms in architecture and industrial design. Optimization of materials and mechanical processes affected every area. Germany embraced this new philosophy and visual style for its simplicity and exactness. In 1919, Walter Gropius, a modernist architect whose work was inspired by Werkbund ideals, was finally successful in opening a school he called the Bauhaus (in Weimar where artists, industrialists, and technicians would develop their products in collaboration). These products would then build a new future for German exports by virtue of their high level of functional utility and beauty.

1.4 Bauhaus

Alex Hass

The Bauhaus philosophy has become famous for its integrated approach to design education; “it precipitated a revolution in art education whose influence is still felt today” (Whitford, 1995, p. 10). Most art colleges and universities still base much of their foundational curriculum on its fundamental ideas.

The Bauhaus school was founded with the idea of creating a ‘total’ work of art in which all arts, including architecture, would eventually be brought together. The first iteration of the school brought together instructors from all over Europe working within the latest art and design styles, manufacturing ideologies, and technologies. An example of this new teaching style can be found in its first-year curriculum. This foundation year exposed all students to the basic elements and principles of design and colour theory, and experimented with a range of materials and processes. This allowed every student the scope to create projects within any discipline rather than focus solely on a specialty. This approach to design education became a common feature of architectural and design schools in many countries.

In addition to its influence on art and design education, the Bauhaus style was to become a profound influence upon subsequent developments and practices in art, architecture, graphic design, interior design, industrial design, and typography.

The school itself had three iterations in its 14-year run. With each iteration, the core concepts and romantic ideals were modified and watered down to work within the realities of the difficult Nazi culture. When the school was finally closed by its own leadership under pressure from the Nazi-led government, most of the faculty left the country to teach in less difficult circumstances and continued to spread Bauhaus precepts all over the world. Many of its artists and intellectuals fled to the United States. Because the Bauhaus approach was so innovative and invigorating, the institutions that were exposed to the Bauhaus methodology embraced its principles. This is why the Bauhaus had a major impact on art and architecture trends in Western Europe, the United States, and Canada.

Later evaluation of the Bauhaus design philosophy was critical of its bias against the organic markings of a human element, an acknowledgment of “... the dated, unattractive aspects of the Bauhaus as a projection of utopia marked by mechanistic views of human nature” (Schjeldahl, 2009, para. 6). And as Ernst Kállai proposed in the magazine *Die Weltbühne* in 1930, “Home hygiene without home atmosphere” (as cited in Bergdoll & Dickerman, 2009, p. 41).

The very machine-oriented and unadorned aesthetic of the Bauhaus refined and evolved, eventually informing the clean, idealistic, and rigorous design approach of the International Typographic Style.

1.5 Dada

Alex Hass

Dada does not mean anything. We read in the papers that the Negroes of the Kroo race call the tail of the sacred cow: dada. A cube, and a mother, in certain regions of Italy, are called: Dada. The word for a hobby-horse, a children's nurse, a double affirmative in Russian and Rumanian, is also: Dada. (Tzara, 1992)

– Tristan Tzara, *Dada Manifesto*

Dada was an artistic and literary movement that began in 1916 in Zurich, Switzerland. It arose as a reaction to World War I, and the nationalism and rationalism, which many thought had brought war about. Influenced by ideas and innovations from several early avant-gardes — Cubism, Futurism, Constructivism, and Expressionism — its influence in the arts was incredibly diverse, ranging from performance art to poetry, sculpture, and painting, to photography and photographic and painterly collage.

Dada's aesthetic, marked by its mockery of materialistic and nationalistic attitudes, became a powerful inspiration for artists and designers in many cities, including Berlin, Paris, and New York, all of which generated their own groups. The movement radically changed typographic ideals and created fresh approaches to text. Unburdened of its rules and conventions, type was allowed to become expressive and subjective. The poetic output of the group was fresh and different, and needed its typography to be as expressive and innovative as its content. Dada, in combination with aspects of Constructivist and Suprematist typography, balanced the cultural discipline created and applied to typography by other streams of contemporary design like the Bauhaus. This movement in particular advanced typography as a medium of its own. It promoted the use of typography as an art material that could be manipulated by artists and designers expressively and without preordained rules and structural principles.

Words emerge, shoulders of words, legs, arms, hands of words. Au, oi, uh. One shouldn't let too many words out. A line of poetry is a chance to get rid of all the filth that clings to this accursed language, as if put there by stockbrokers' hands, hands worn smooth by coins. I want the word where it ends and begins. Dada is the heart of words. (Ball, 1996)

– Hugo Ball's *manifesto*, read at Zunfthaus zur Waag on July 14, 1916

1.6 International Typographic Style

Alex Hass

International Typographic Style (ITS), also known as the Swiss Style, emerged in Switzerland and Germany in the 1950s. ITS became known for design that emphasized objective clarity through the use of compositional grids and sans serif typography as the primary design material (or element).

Guiding Principles

ITS was built on the shoulders of the ‘less is more’ ideal of the German Werkbund and the Bauhaus school. But its pioneers pursued ideologies that had much more depth and subtlety. Ernst Keller, whose work in design spanned over four decades, brought an approach to problem solving that was unique. His contribution to design was in defining the problem. For Keller, the solution to a design problem rested in its content. Content-driven design is now a standard practice. Max Bill, another pioneer, brought a purist approach to design that he had been developing since the 1930s. He was instrumental in forming Germany’s Ulm School of Design, famous for its ITS approach. The school introduced Greek rhetorical devices to amplify concept generation and produce greater conceptual work, while the study of semiotics (creating and understanding symbols and the study of sending and receiving visual messages) allowed its design students to understand the parameters of communication in a more scientific and studied way. At this time, there was also a greater interest in visual complexity. Max Huber, a designer known for his excellent manipulation of presses and inks, layered intense colours and composed chaotic compositions while maintaining harmony through the use of complex grids that structured and unified the elements. He was one of many designers who began using grids in strategic ways. ITS design is now known for its use of anchored elements within a mathematical grid. A grid is the “most legible and harmonious means for structuring information” (Meggs & Purvis, 2011, p. 355). Visual composition changed in many ways due to the grid. Design was already moving toward asymmetrical compositions, but now even the design of text blocks changed — from justified text to aligned flush left, ragged right. Fonts chosen for the text changed from serif fonts to sans serif, a type style believed to “express the spirit of a more progressive age” by early designers in the movement. Sans-serif typefaces like Helvetica, Univers, and Akzidenz Grotesk were favoured because they reflected the ideals of a progressive culture more than traditional serif fonts like Times or Garamond. ITS balanced the stabilizing visual qualities of cleanliness, readability, and objectivity with the dynamic use of negative space, asymmetrical composition, and full background photography.

Photography

ITS did not use illustrations and drawings because of their inherent subjectivity. Photography was preferred because of its objective qualities, and was heavily used to balance and organically complement the typography and its structured organizational grid. Often the photograph sat in the background with the type designed to sit within it; the two composed to strengthen each other to create a cohesive whole. ITS refined the presentation of information to allow the content to be understood clearly and cleanly,

without persuading influences of any kind. A strong focus on order and clarity was desirable as design was seen to be a “socially useful and important activity ... the designers define their roles not as artists but as objective conduits for spreading important information between components of society” (Meggs & Purvis, 2011, p. 355).

Josef Müller-Brockmann, another one of its pioneers, “sought an absolute and universal form of graphic expression through objective and impersonal presentation, communicating to the audience without the interference of the designer’s subjective feelings or propagandistic techniques of persuasion” (Schneider, 2011). Müller-Brockmann’s posters and design works feature large photographs as objective symbols meant to convey his ideas in particularly clear and powerful ways.

After World War II, international trade began to increase and relations between countries grew steadily stronger. Typography and design were crucial to helping these relationships progress — multiple languages had to be factored into a design. While clarity, objectivity, region-less glyphs, and symbols were essential to communication between international partners, ITS found its niche in this communicative climate and expanded beyond Switzerland, to America.

ITS is still very popular and commonly used for its clarity and functionality. However, there is a fine line between clean and simple, and simply boring. As the style became universal, its visual language became less innovative and was perceived to be too restrictive. Designers wanted the freedom to be expressive, and the culture itself was moving from cultural idealism to celebratory consumerism. ITS can be a very successful design strategy to adopt if there is a strong concept binding all of the design components together, or when there is a vast amount of complexity in the content and a visual hierarchy is needed to calm the design to make it accessible.

1.7 Late Modern | New York Style

Alex Hass

Late Modernism encompasses the period from the end of World War II to the early 21st century. Late Modernism describes a movement that arose from and reacted to trends in ITS and Modernism. The Late Modern period was dominated by American innovations spurred on by America's new-found wealth. The need for more advertising, marketing, and packaging was matched by a new mood in the culture — a mood that was exuberant and playful, not rigid and rule-oriented.

Late Modern was inspired by European avant-garde immigrants. These immigrants found work in design and quickly introduced Americans to early modern principles of an idealistic and theoretical nature. American design at this point had been pragmatic, intuitive, and organic in composition. The fusion of these two methodologies in a highly competitive and creative climate produced design work that was original in concept, witty, and provocative and, as personal expression was highly prized, full of a variety of visual styles. Paul Rand is one of the great innovators of this style. Rand was adept at using ITS when its rules and principles were called for, but he was also very influenced by European art movements of the times. In his work, he fused the two and made works that were accessible, simple, engaging, and witty. His work was inspirational, but his writing and teaching were as important, if not more, to redefining the practice of design. He restructured the design department at Yale and published books on design practice informed by ITS principles, softened by wit, and espoused the value of the organic look of handmade marks. As a result, artists and designers began to merge organic shapes with simple geometry.

The look of graphic design also changed through advancements in photography, typesetting, and printing techniques. Designers felt confident in exploring and experimenting with the new technologies as they were well supported by the expertise of the print industry. Designers began to cut up type and images and compose directly on mechanical boards, which were then photographed and manipulated on the press for colour experimentation. As well, illustration was once again prized. Conceptual typography also became a popular form of expression.

Push Pin Studios

An excellent example of this expansive style can be found in the design output of New York's Push Pin Studios. Formed by Milton Glaser and Seymour Chwast, Push Pin was a studio that created innovative typographic solutions — I♥NY— brand identities, political posters, books, and albums (such as Bob Dylan's album *Dylan*). It was adept at using and mixing illustration, photography, collage, and typography for unexpected and innovative visual results that were always fresh and interesting as well as for its excellent conceptual solutions. The influence of Push Pin and Late Modern is still alive and has recently experienced a resurgence. Many young designers have adopted this style because of its fresh colours, fine wit, and spontaneous compositions.

1.8 Post Modern

Alex Hass

By the early 1970s, the idealistic principles of Modernism were fading and felt flat and lifeless. Pluralism was again emerging as people craved variety as a reaction to the reductivist qualities that modernism espoused.

Punk

In the late 1970s in Britain, Australia, and parts of the United States, a youthful rebellious culture of anger and disdain arose against the establishment. In many ways, the design language of Punk echoed the Dadaist style, though Punk was anchored with a pointed, political message against the tyranny of society and the disenfranchisement of youth. A use of aggressive collages, colours, and experimental photography were its hallmarks. These free-form, spontaneous design works incorporated pithy tag lines and seethed with anger in a way that Dada work never attempted to achieve. Punk actively moved away from the conformities of design, and was anti-patriotic and anti-establishment. Punk established the do-it-yourself (DIY) ethos and stylized it with the angry anti-establishment mood of the mid 1970s, a time of political and social turbulence. DIY style was considered shocking and uncontrolled. However, the influence on design has been far reaching and subsequently widely emulated.

Jamie Reid, a pioneer of the Punk style, developed the visual signature look for the Sex Pistols and many other punk bands. His personal signature style was known for a collaged 'ransom note' typography that became a typographic style of its own. Reid cut letters out of newspapers and magazines, and collaged them together to be photographed. By doing this, he could see what he was creating as he went along, trying out different font styles and sizes and seeing the results instantly. Treating type as if it were a photograph also freed him from the restrictions of typesetting within a structured grid and allowed him to develop his ideas and concepts as he created. This unguided, process-free approach to design became a part of the Post Modern experimentation that was to come.

When Punk first exploded in the 1970s, it was deemed a youthful rebellion. In actuality, it was one of the many forms of visual expression that manifested as part of the Postmodernist movement that began as a reaction to the rigid restrictions of Modernism.

Early Post Modernism

Early Swiss Post Modern design was driven by the experimentations and teachings of Wolfgang Weingart who taught at the Basel School of design in Basel, Switzerland. Weingart was taught ITS by the masters of the style, Emil Ruder and Armin Hofmann at the Basel School. But once he became an instructor there, he questioned the "value of the absolute cleanliness and order" (Meggs & Purvis, 2011, p. 465) of the style. He experimented vigorously with breaking all typographic and organizational rules to see what the effect on the audience would be. He invigorated typography with energy and in turn

changed the viewer's response to the visual information. Instead of a simple fast reading, the reader now faced dynamic complexity free of any rules or hierarchies. The viewer was now compelled to spend more time with a design piece to understand its message and parse the meaning of its symbolism.

One of his American students, April Greiman, brought this new design language back to California with her and heavily influenced the youth culture there. David Carson, a self-taught designer working in the surf magazine world, took the ideas of the style and adopted them to his own typographic experiments in the surfing magazines he designed. For Carson, Post Modern design reflected the free spirit of the surf community.

Post Modernism is actually an umbrella term for many visual styles that came about after the 1980s. They are unified by their reaction to Modernism's guiding principles — particularly that of objectivity. A key feature of Post Modern design is the subjective bias and individual style of the designers that practise it. Additional defining stylistic characteristics can be summarized in the idea of 'deconstruction.' The style often incorporates many different typefaces breaking every traditional rule of hierarchy and composition. Visual organization becomes more varied and complicated with the use of layers and overlapping. The use of image appropriation and culture jamming is a key feature. Dramatic layouts that do not conform to traditional compositions are another common characteristic. A traditional grid is not used to organize the layout of the elements, making composition look 'free-style.' Other organizational systems for the elements developed — axial, dilatational, modular, and transitional systems created a fresh way to organize the information. The combination of multiple geometric shapes layered with photographs created depth that worked well on the computer monitor — now a component of contemporary society.

Post Modernism is still in use today, though selectively. The chaos created by our technological advancements needs to be balanced with the ease of accessing information. The Apple brand is a good example of a contemporary design approach that feels fresh and current, while delivering massive amounts of information in a clean and simple way. The Post Modern methods of built-in visual difficulty are less welcome in our data-saturated culture.

1.9 Summary

Alex Hass

The technological revolution of the 1990s brought the mobile phone and computer to every home and office and changed the structure of our current society much as manufacturing in the 1800s changed Britain and the Western world. As with the Industrial Revolution, the change in technology over the last 20 years has affected us environmentally, socially, and economically. Manufacturing has slowly been moved offshore and replaced with technology-based companies. Data has replaced material as the substance we must understand and use effectively and efficiently. The technological development sectors have also begun to dominate employment and wealth sectors and overtake manufacturing's dominance. These changes are ongoing and fast-paced. The design community has responded in many novel ways, but usually its response is anchored by a look and strategy that reduce ornament and overt style while focusing on clean lines and concise messaging. The role of design today is often as a way-finder to help people keep abreast of changes, and to provide instruction. Designers are once again relying on established, historic styles and methods like ITS to connect to audiences because the message is being delivered in a complex visual system. Once the technological shifts we are experiencing settle down, and design is no longer adapting to new forms of delivery, it will begin to develop original and unique design approaches that complement and speak to the new urban landscape.

Questions to consider after completing this chapter:

1. What design principles do Dada and Punk have in common?
2. What influence does ITS have on Post Modern design?
3. What influence does ITS have on current design practice?
4. How did World War II influence design education?
5. How did Morris and the Arts & Crafts movement help to create the Bauhaus design philosophy?
6. How did technology influence early German design?
7. How does technology influence contemporary design practice?

Chapter 2. Design Process

2.1 Introduction

Alex Hass

Learning Objectives

- Explain the role of communication design in print and media
- Describe how the creative process relates to strategic problem solving
- Contrast how the creative process relates to the design process
- Define critical phases of the design process
- Discover how project research helps to define a communication problem
- Give examples of brainstorming techniques that generate multiple concepts based on a common message
- Learn about metaphors and other rhetorical devices to generate concepts
- Explore how concepts translate into messages within a visual form

Communication Design and The Design Process

The practice of graphic or communication design is founded on crafting visual communications between clients and their audience. The communication must carry a specific message to a specific audience on behalf of the client, and do so effectively — usually within the container of a concept that creates context and builds interest for the project in the viewer.

See an illustrated model of the design process here: [A Model of the Creative Process](#)

Overview of the Design Process

The process of developing effective design is complex. It begins with research and the definition of project goals. Defining goals allows you to home in on precisely what to communicate and who the audience is. You can then appropriately craft the message you are trying to communicate to them. Additional information regarding how to deliver your message and why it's necessary are also clarified in the research stage. Often the preferred medium becomes clear (i.e., web, social media, print, or advertising) as does the action you want your audience to take. Asking a millennial to donate to a cause is a good example. Research reveals that transparency of donation use, donor recognition, and ease of making the donation are vital to successfully engaging a millennial audience (Grossnickle, Feldmann, White, & Parkevich, 2010). Research also reveals that millennials resist negative advertising, so the

message must be crafted in positive terms that are anchored to a realistic environment (Tanyel, Stuart, & Griffin, 2013). Knowing this information before the concept development begins is vital to crafting a message that will generate the response your client needs. Critiquing and analysis allow you to evaluate the effectiveness of the design approach as it develops through the stages of an iterative process.

In order to design visual materials that communicate effectively, designers must understand and work with the syntax of visual language. Meaning is expressed not only through content but through form as well, and will include both intellectual and emotional messages in varying degrees.

Developing Concepts into Design Solutions

Designers are responsible for the development of the creative concepts that express the message. A **concept** is an idea that supports and reinforces communication of key messages by presenting them in interesting, unique, and memorable ways on both intellectual and emotional levels. A good concept provides a framework for design decisions at every stage of development and for every design piece in a brand or ad campaign. An early example of this is the witty and playful ‘think small’ Volkswagen Beetle (VW) advertising campaign of the 1960s. By amplifying the smallness of its car in a ‘big’ car culture, VW was able to create a unique niche in the car market and a strong bond between the VW bug and its audience (see Figure 2.1).

Figure 2.1 Volkswagen Beetle

When you implement solutions, you put concepts into a form that communicates effectively and appropriately. In communication design, form should follow and support function. This means that what you are saying determines how you say it and in turn how it is delivered to your audience. Design is an **iterative** process that builds the content and its details through critiquing the work as it develops. Critiquing regularly keeps the project on point creatively and compositionally. Critiquing and analysis allow you to evaluate the effectiveness of the whole design in relation to the concept and problem. The number of iterations depends on the skill of the designer in developing the content and composition as well as properly evaluating its components in critique. In addition, all of this must occur in the context of understanding the technologies of design and production.

As you begin to build and realize your concepts by developing the content, the elements, and the layouts, you must apply compositional and organizational principles that make sense for the content and support the core concept. Compositional principles are based on psychological principles that describe how human beings process visual information. Designers apply these principles in order to transmit meaning

effectively. For example, research has shown that some kinds of visual elements attract our attention more than others; a designer can apply this knowledge to emphasize certain parts of a layout and give a certain element or message importance. These principles apply to all forms of visual materials, digital media, and print.

When dealing with text, issues of legibility and readability are critical. Designers organize information through the use of formal structures and typographic conventions to make it easier for the viewer to absorb and understand content. The viewer may not consciously see the underlying structures, but will respond positively to the calm clarity good organization brings to the text.

2.2 Design Research and Concept Generation

Alex Hass

Defining Design Problem Parameters

Many designers define communication design as a problem-solving process. (The problem/opportunity is how to deliver information effectively to the desired audience.) The process that takes the designer from the initial stages of identifying a communication problem to the final stage of solving it covers a lot of ground, and different models can be used to describe it. Some are very complicated, and some are simple. The following sections break the design problem-solving process into four steps: (1) define, (2) research, (3) develop concepts, and (4) implement solutions.

2.3 Define

Alex Hass

Step 1: Define the Communication Problem

The inventor Charles Kettering is famously quoted as saying “a problem well-stated is half-solved.” Clearly the first step in any design activity is to define the communication problem properly. To do this, you will need to meet with clients to establish initial goals and objectives.

Here are some of the questions you should ask:

- What is the business of the client; what products or services does the client offer?
- What are the client’s long-term business goals? (What does the client want its business to have accomplished in 5 or 10 years?)
- What is the purpose of the project? What does the client hope to achieve with it? (The goals of a specific project are usually narrower than overall long-term business goals, but should fit within the larger picture.)
- What are the performance criteria that will be used to evaluate whether project goals are met?
- Who is the target audience?
- What is the client’s message to this audience?
- How does this project fit in with existing corporate materials?
- Does this piece require more than one format or medium?
- What corporate guidelines (if any) must be adhered to?
- Are illustration, photography, or any other special services required?
- Are there any special or unusual considerations around this project?
- What quantity is needed (for print)?
- What distribution method will be used (for print)?
- What is the budget?
- Who will approve the project? Will that person be available for sign-off when required?

Good planning at the beginning can make a project run smoothly and without surprises. Don’t assume anything; both the designer and the client should listen closely to each other and ask plenty of questions. Keep in regular communication, document discussions, and ensure that you have written confirmation of decisions.

2.4 Research

Alex Hass

Step 2: Conduct Research

Gather and analyze information What else do you need to know? The information you collected in the first stage is just a starting point — now you need to do more research in order to fine-tune your goals and process. Check every assumption, ask more questions, and add detail.

Research practices may involve:

- Competitor analysis: analyzing the competition to see what they do and determine their strengths and weaknesses
- **Ethnographic** research: observing user behaviour and culture
- Site research: observing and understanding the strengths and weaknesses of a space to optimize the effectiveness of the design experience you will be creating; site research is necessary to any design project that is situated in a built environment
- Marketing research: analyzing behaviour in terms of consumer practices, including demographic profiling (grouping people based on variables such as age/income/ethnicity/location to create profiles generally describing their thinking/behaviour)
- User testing: measuring the ability of the product or service to satisfy users' needs
- Co-creation: inviting end-users to **brainstorm** solutions with the design team before the concept phase of design begins

Incorporating Research into the Design Process

Research should be a part of all design process, but what kind of research is done, and who does it, will be determined by the scope and budget of the project. Some information may be publicly available, for example, through corporate publications or previously published marketing studies or market data, but a design company may need to partner with a research firm in order to do targeted in-depth research.

At the very least, design research should include:

- A literature review (gathering and reviewing all existing material that is relevant to your subject)
- Collected details (existing materials, corporate guidelines) of your client's business and the services the client offers
- Information on the **target audience** (What do they want? need? expect?)
- Analysis of competitors (Who are they? how are they different? how are they the same? how

do they advertise or make information available?)

- Estimates and technical advice from subcontractors (e.g., printers)

Some things to consider:

- Is a full design audit required? Much like a SWOT analysis, which assesses strengths, weaknesses, opportunities, and threats, a design audit applies the same stringent methodology to analyzing your competitors' visual presence in the marketplace.

A graphic design audit is a fantastic and relatively easy way to get a clear picture of how your competitors are perceived, what key messages they are communicating and how you look when placed alongside them. It's also a valuable exercise that informs you about the type of communication your customers are receiving on a regular basis from your key competitors. (Clare, 2006)

- What are the implications of the audience profile in relationship to the project goals?
- What is the most appropriate means to communicate with this audience (i.e., what media and marketing tools should you use)?
- How do the goals of this project fit into your client's long-term goals?
- Is your client's message what actually needs to be communicated in order to further the client's business goals?

Research takes time and can cost money, but in the larger picture will save time and money by helping to focus the direction of the design process. It also helps you provide justification for your proposed communication solutions to your client. Remember that all research must be carefully documented and raw sources saved and made available for future reference.

Now that you have gathered all the information, it's time to craft the design problem into a well-defined, succinct statement.

A Problem Well-stated is Half-solved

The writer Mark Levy, in his article [A Problem Well-stated is Half-solved](#), developed six steps you can take to state a design problem so its solutions become clearer:

1. State the problem in a sentence. A single sentence forces you to extract the main problem from a potentially complex situation. An example of a problem statement: "We need to increase revenue by 25%."
2. Make the problem statement into a question. Turning the problem statement into a question opens the mind to possibilities: "How do we increase revenue by 25%?"
3. Restate the question in five ways. If you spin the question from a variety of perspectives, you'll construct new questions that may provide intriguing answers.
For instance, try asking: "How could we increase revenue by 25% in a month?" "How could we increase it by 25% in an hour?" "How could we increase it by 25% in a minute?" "What could we stop doing that might cause a 25% revenue increase?" "What ways can we use our existing customer base to affect the increase?"
4. Give yourself thinking quotas. An arbitrary production quota gives you a better shot at coming up

with something usable, because it keeps you thinking longer and with greater concentration. When I asked you to “Restate the question five ways,” that was an example of an arbitrary quota. There’s nothing magical about five restatements. In fact, five is low. Ten, or even a hundred, would be far better.

5. Knock your questions. Whatever questions you’ve asked, assume they’re wrong-headed, or that you haven’t taken them far enough.
You might ask, “Why do we need an 25% increase at all? Why not a 5% increase? A 500% increase? A 5,000% increase? What other things in the business might need to change that would be as important as revenue?”
6. Decide upon your new problem-solving question. Based on the thinking you’ve already done, this step may not even be necessary. Often, when you look at your situation from enough angles, solutions pop up without much more effort.

However, if you still need to pick a single question that summarizes your problem, and none seems perfect, force yourself to choose one that’s at least serviceable. Going forward is better than standing still.

Now you can start brainstorming.

Concept Mapping

A good way to begin the process of research and problem definition is to write down everything that you already know about your subject. This brainstorming can be done in a linear way by developing lists, or in a non-linear way, popular with designers, called *concept mapping*. Concept mapping is a non-linear approach that allows a designer to see what is known and what still needs to be researched. Concept mapping is also used to generate concepts and to create associations and themes.

W5 + 1

The first step is to take a sheet of paper and write a central title or topic in the centre. Then surround this central idea with information gathered by answering the following questions, based on the 5 Ws (who, what, where, why, and when), plus one more, how:

- What are you trying to communicate? (the problem)
- Why must communication occur? (what is its purpose?)
- Who is the target audience?
- Where will communication take place? (in what medium and location?)
- When will communication take place?
- How will you implement the concept?
- What if? (what would be ideal?)

Once you’ve added all the information you have at hand, you will see any assumptions and gaps in that information, and you can begin specific directed research to create a larger, more objective picture.

Here is an example of a concept map (See Figure 2.2). To see a [concept map that details the scope of visual communication](#).

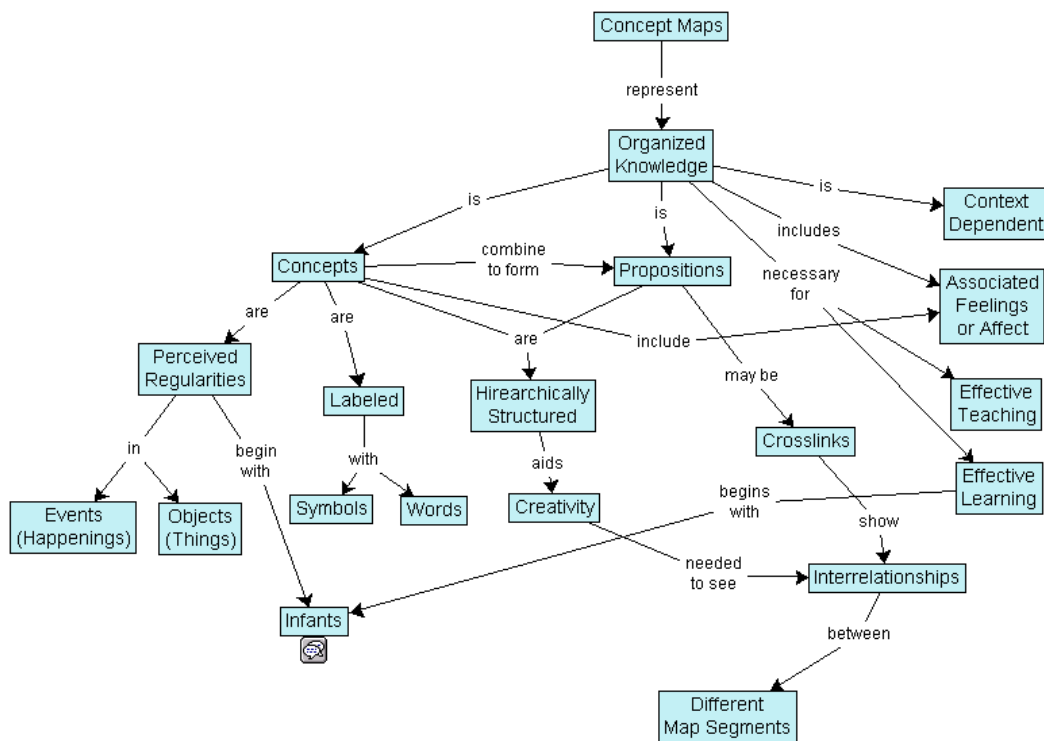

Figure 2.2 Example of a concept map

You can use the information in a concept map to generate other themes and concepts for your project. For example, in the concept map above, you could develop another theme by highlighting in yellow all information from the 1970s. This would reveal the parameters of design practice in the 70s and would additionally reveal what has been added and changed in design practice since.

2.5 Develop Concepts

Alex Hass

Step 3: Developing Concepts

Concept development is a process of developing ideas to solve specified design problems. The concepts are developed in phases, from formless idea to precise message in an appropriate form with supportive visuals and content. Once you have done your research and understand exactly what you want to achieve and why, you are ready to start working on the actual design. Ideally, you are trying to develop a concept that provides solutions for the design problem, communicates effectively on multiple levels, is unique (different and exciting), and stands out from the materials produced by your client's competitors.

Generate, test, and refine ideas

A good design process is a long process. Designers spend a great deal of time coming up with ideas; editing, revising, and refining them; and then evaluating their results every time they try something. Good design means assessing every concept for effectiveness.

The design process looks roughly like this:

- Generating a concept
- Refining ideas through visual exploration
- Preparing rough layouts detailing design direction(s)
- Setting preliminary specifications for typography and graphic elements such as photography, illustration, charts or graphs, icons, or symbols
- Presenting design brief and rough layouts for client consideration
- Refining design and comprehensive layouts, if required
- Getting client approval of layouts and text before the next phase

Developing Effective Concepts

A concept is not a message. A concept is an idea that contextualizes a message in interesting, unique, and memorable ways through both form and design content.

A good concept reinforces strategy and brand positioning. It helps to communicate the benefits of the offer and helps with differentiation from the competition. It must be appropriate for the audience, facilitating communication and motivating that audience to take action.

A good concept provides a foundation for making visual design decisions. For example, Nike's basic

message, expressed by its tagline, is “Just Do It.” The creative concept Nike has used since 1988 has been adapted visually in many ways, but always stays true to the core message by using images of individuals choosing to take action.

“It was a simple thing,” Wieden recalls in a 2009 Adweek video interview in which he discusses the effort’s genesis. Simplicity is really the secret of all “big ideas,” and by extension, great slogans. They must be concisely memorable, yet also suggest something more than their literal meanings. Rather than just putting product notions in people’s minds, they must be malleable and open to interpretation, allowing people of all kinds to adapt them as they see fit, and by doing so, establish a personal connection to the brand (Gianatasio, 2013).

A good concept is creative, but it also must be appropriate. The creativity that helps develop effective, appropriate concepts is what differentiates a designer from a production artist. Very few concepts are up to that standard — but that’s what you should always be aiming for.

In 1898, Elias St. Elmo Lewis came up with acronym AIDA for the stages you need to get consumers through in order for them to make a purchase. Modern marketing theory is now more sophisticated, but the acronym also works well to describe what a design needs to do in order to communicate and get people to act.

In order to communicate effectively and motivate your audience, you need to:

A — attract their attention. Your design must attract the attention of your audience. If it doesn’t, your message is not connecting and fulfilling its communication intent. Both the concept and the form must stand out.

I — hold their interest. Your design must hold the audience’s interest long enough so they can completely absorb the whole communication.

D — create a desire. Your design must make the audience want the product, service, or information.

A — motivate them to take action. Your design must compel the audience to do something related to the product, service, or information.

Your concept works if it makes your audience respond in the above ways.

Generating Ideas and Concepts from Concept Mapping

You can use the information in a concept map to generate additional concepts for your project by reorganizing it. The [concept tree method](#) below comes from the mind-mapping software blog (Frey, 2008)

1. Position your design problem as the central idea of your mind map.
2. Place circles containing your initial concepts for solving the problem around the central topic.
3. Brainstorm related but non-specific concepts, and add them as subtopics for these ideas. All related concepts are relevant. At this stage, every possible concept is valuable and should not be judged.

4. Generate related ideas for each concept you brainstormed in step 3 and add them as subtopics.
5. Repeat steps 3 and 4 until you run out of ideas.

Applying Rhetorical Devices to Concept Mapping

After you have placed all your ideas in the concept map, you can add additional layering to help you refine and explore them further. For example, you can use rhetorical devices to add context to the concepts and make them come alive. **Rhetoric** is the study of effective communication through the use and art of persuasion. Design uses many forms of rhetoric — particularly metaphor. If you applied a metaphor-based approach to each idea in your concept map, you would find many new ways to express your message.

Rhetorical Devices Appropriate for Communication Design

Allusion is an informal and brief reference to a well known person or cultural reference. In the magazine cover linked below, an allusion is used to underline the restrictive nature of the burqa, a full body cloak worn by some Muslim women, by applying it to Sarah Jessica Parker, an actor whose roles are primarily feminist in nature. (Harris, 2013)

Follow the link to see an example: [Marie Claire Cover](#)

Amplification involves the repetition of a concept through words or images, while adding detail to it. This is to emphasize what may not be obvious at first glance. Amplification allows you to expand on an idea to make sure the target audience realizes its importance. (Harris, 2013)

Follow the link to see an example: [Life's too short for the wrong job Marketing Campaign](#)

Analogy compares two similar things in order to explain an otherwise difficult or unfamiliar idea. Analogy draws connections between a new object or idea and an already familiar one. Although related to simile, which tends to employ a more artistic effect, analogy is more practical; explaining a thought process, a line of reasoning, or the abstract in concrete terms. Because of this, analogy may be more insightful. (Harris, 2013)

Follow the link to see an example: [WWF Lungs Before It's Too Late](#)

Hyperbole is counter to understatement. It is a deliberate exaggeration that is presented for emphasis. When used for visual communication, one must be careful to ensure that hyperbole is a clear exaggeration. If hyperbole is limited in its use, and only used occasionally for dramatic effect, then it can be quite attention grabbing.

Follow the link to see an example: [Final Major Project by Mark Studio](#)

A written example would be: *There are a thousand reasons why more research is needed on solar energy.*

Or it can make a single point very enthusiastically: *I said "rare," not "raw." I've seen cows hurt worse than this get up and walk.*

Hyperbole can be used to exaggerate one thing to show how it differs from something to which it is being compared: *This stuff is used motor oil compared to the coffee you make, my love.*

Hyperbole is the most overused rhetorical device in the world (and that is no hyperbole); we are a society of excess and exaggeration. Handle it like dynamite, and do not blow up everything you can find (Harris, 2013).

Metaphor compares two different things by relating to one in the same terms commonly used for the other. Unlike a simile or analogy, metaphor proposes that one thing is another thing, not just that they are similar (Harris, 2013).

Follow the link to see an example: [Ikea Bigger Storage Idea](#)

Metonymy is related to metaphor, where the thing chosen for the metaphorical image is closely related to (but not part of) that with which it is being compared. There is little to distinguish metonymy from synecdoche (as below). Some rhetoricians do not distinguish between the two (Harris, 2013).

Follow the link to see an example: [London Logo](#)

Oxymoron is a paradox presented in two words, in the form of an adjective and noun (“eloquent silence”), or adverb-adjective (“inertly strong”), and is used to impart emphasis, complexity, or wit (Harris, 2013). See Figure 2.3 for another example.

Figure 2.3 Example of an oxymoron

Personification attributes to an animal or inanimate object human characteristics such as form, character, feelings, behaviour, and so on. Ideas and abstractions can also be personified. For example, in the poster series linked below, homeless dogs are placed in environments typical of human homelessness (Harris, 2013).

Follow the link to see an example: [Manchester Dogs' Home Street Life](#)

Simile is a comparison of one thing to another, with the two being similar in at least one way. In formal

prose, a simile compares an unfamiliar thing to a familiar thing (an object, event, process, etc.) known to the reader. (Harris, 2013)

Follow the link to see an example: [Strong Handle Billboard](#)

Synecdoche is a type of metaphor in which part of something stands for the whole, or the whole stands for a part. It can encompass many forms such that any portion or quality of a thing is represented by the thing itself, or vice versa (Harris, 2013).

Follow the link to see an example: [A Global Warming Poster](#)

Understatement deliberately expresses a concept or idea with less importance as would be expected. This could be to effect irony, or simply to convey politeness or tact. If the audience is familiar with the facts already, understatement may be employed in order to encourage the readers to draw their own conclusions (Harris, 2013).

For example: *instead of endeavouring to describe in a few words the horrors and destruction of the 1906 earthquake in San Francisco, a writer might state: The 1906 San Francisco earthquake interrupted business somewhat in the downtown area.*

Follow the link to see an example: [Nike's Just Do It](#)

An excellent online resource for exploring different rhetorical devices is [“A Handbook of Rhetorical Devices”](#) (Harris, 2013). The definitions above have been paraphrased from this site.

Developmental Stages of Design

No design work should ever be done without going through an iterative development process in which you try out different ideas and visual approaches, compare and evaluate them, and select the best options to proceed with. This applies to both form and content.

The development of the concept starts with brainstorming as wide a range of ideas as possible, and refining them through a number of development stages until you are left with those that solve the communication problem most effectively.

The development of graphic forms starts with exploring a wide range of styles, colours, textures, imagery, and other graphic devices and refining them through development stages until you are left with those that best reinforce the concept and message.

The development process starts with **thumbnails** and works through rough layouts and comprehensives to the final solution. Thumbnails are small, simple hand-drawn sketches, with minimal information. These are intended for the designer's use and, like concept maps, are visuals created for comparison. These are not meant to be shown to clients.

Their uses include:

- Concept development and visualization of ideas
- Preliminary evaluation of content (they allow you to sift and sort ideas quickly and effectively)

- Preliminary evaluation of form (value studies, compositional studies, potential placement of elements)
- Note-taking (a tool to record verbal or visual information quickly and accurately)

Quantity is very important in thumbnails! The idea is to get as many ideas and options down as possible. Designers typically take one of two approaches when they do thumbnails: they either brainstorm a wide range of ideas without exploring any of them in depth, or they come up with one idea and create many variations of it. If you use only one of these approaches, force yourself to do both. Brainstorm as many ideas as possible, using a mix of words and images. The point here is the quantity of ideas — the more the better. Work fast and don't judge your work yet.

Once you have a lot of ideas, take one you think is good and start exploring it. Try expressing the same idea with different visuals, from different points of view, with different taglines and emotional tones. Make the image the focal point of one variation and the headline the focal point of another. The purpose here is to try as many variations of an idea as possible. The first way of expressing an idea is not necessarily the best way, much like the first pancake is not usually the best.

After you've fully explored one idea, choose another from your brainstorming session and explore it in the same way. Repeat this with every good idea.

Roughs are exactly that — rough renderings of thumbnails that explore the potential of forms, type, composition, and elements of your best concepts. Often a concept is explored through the development of three to five roughs. These are used to determine exactly how all of the elements will fit together, to provide enough information to make preliminary evaluation possible, and to suggest new directions and approaches.

The rough:

- Uses simple, clean lines and basic colour palettes.
- Accurately renders without much detail (the focus is on design elements, composition, and message)
- Includes all of the visual elements in proper relationship to each other and the page

Comps are created for presenting the final project to the client for evaluation and approval. The comp must provide enough information to make evaluation of your concept possible and to allow final evaluation and proofing of all content.

The comp:

- Is as close as possible to the final form and is usually digital
- May use final materials or preliminary/placeholder content if photographs or illustrations are not yet available

Hand-drawn or Digital?

Comps might be hand-drawn when you are showing a concept for something that doesn't yet exist, such

as a product that hasn't been fabricated, a structure that hasn't been built, or to show a photographer how you want material to be laid out in a photograph that has not yet been taken. Although you could create these comps digitally, it's often more cost effective to create a sketch.

Designers sometimes create hand-drawn comps in order to avoid presenting conceptual work that looks too finished to a client, so they will not be locked into a particular approach by the client's expectations.

Even in this digital age, you should draw all thumbnails by hand (using pen, pencil, or tablet) for the following reasons:

- You don't have to make time-wasting decisions that you shouldn't be making at this early stage (e.g., what typeface should I use? what colour should this be?)
- It's much faster than doing it digitally.
- Work done on a computer tends to look finished and professional, and this can trick you into thinking an idea is better than it is.
- The technology of a tool tends to define the way it is used. If you are using a computer, you will tend to come up with solutions that can be executed only on a computer, and that limits your creative options. For example, would you think of creating an illustration from coloured paper if you were using the computer?
- Hand-drawn sketches provide a paper trail that shows your concept development process and can be presented in case studies to reveal your entire design process in a more personal and engaging way.

2.6 Implement Solutions

Alex Hass

Step 4: Solution Implementation

In this step, we are ready to select the final concept options and carry their application through to completion in producing the final design(s). This part of the process requires that you know how to work with photographers and illustrators, as well as with people in production technologies — primarily, programmers and printers. You may also require project management skills. You should also put a process in place so your final solutions can be evaluated for their effectiveness. Did they work? Did they achieve their goals?

There are many components that require attention during the production phase:

Production and Implementation

- Copy placement and preparation of layouts from approved text
- Liaison with suppliers and subcontractors
- Completion of photography, illustration, charts/graphs, icons/symbols
- Ongoing client liaison for proofreading and corrections
- Scanning and electronic preparation of images (black and white, duotones/tritones, colour); may include colour correction and/or digital manipulation
- Preparation of electronic files in line with press/prepress/web requirements
- Supervision of all prepress materials (final files and proofs)
- Organization, maintenance, and archiving of all digital materials related to the job

Production Supervision

- Discuss production options with client, solicit quotes, and select printer/programmer
- When contract is awarded, liaise with production services to discuss and refine project details
- Prepare or review production specifications
- Liaise with client and production to check proofs
- Oversee production to ensure quality control
- Follow up after production work is complete

Evaluation

Every step of a project should be evaluated in terms of the goals you have defined. Two fundamental questions about every design decision you make are:

- What does this accomplish?
- How does what is accomplished help to meet the project goals?

After the original design challenge has been defined, evaluate every stage of the process in that context. It's surprisingly easy to stray off track when you're designing. If you find yourself designing something brilliant, but it doesn't communicate what it should to the right audience, then all that brilliance is wasted.

Communication

Whether they are in print or multimedia, all design works are intended to communicate to a specific audience, and the design must support that function. All concepts must be evaluated with that end in mind. For example:

- Does the work communicate the key message(s) and support the client's goals?
- Does the work effectively integrate images, design, and text (form and content) to support that communication; create an overall 'look'; make the piece work as a unified whole with no distractions?
- Is the piece physically easy to read and/or understand?
- Do the design choices amplify material (subject matter, mood) in the text?
- Is the piece appropriate to the audience? (children, youth, adults, seniors have particular interests and needs)

Economic Efficiency

- What is possible and most effective within the budget?
- Will this method attract the desired audience/buyer?

Design and Materials

- Are the design choices compatible with technological requirements for production?
- For print materials, is there efficient and economical use of paper?
- Will the materials chosen support the intended use and method of distribution?

2.7 Summary

Alex Hass

Communication design can be described as a problem-solving process that can be broken into four steps: (1) define, (2) research, (3) develop concepts, and (4) implement solutions. Research should be a part of all design process determined by the scope and budget of the project. Concept mapping is a non-linear approach that outlines what is known, what is needs, creates associations and themes, and helps generate ideas. Good design takes time that involves generating and assessing concepts. Time is also spent editing, revising, refining , and evaluating ideas.

In conclusion, defining the design process is complicated as it has many stages and involves many steps at each stage. Complicating it further is the reality that every project is unique in its parameters, goals, time period, and participants. This chapter is meant to facilitate the beginning of how you define your individual design process by basing it on general guidelines. If you are still developing an understanding of your personal design strengths and weaknesses, allow extra time for each stage and track your time for each stage. You'll soon discover if you fall into the category of a brainstorming, conceptual, or project development type. Conceptual designers find it easy to develop multiple concepts, but less easy to take the steps to develop them to their full potential. Project development types are the opposite — finding concepts hard to create, but developing projects quite easy. Allow extra time to discover which category you fall into and also to develop strengths in your weaker area. As you gain experience developing design projects, you will start to personalize your design process and be able to estimate how long it takes with a fair degree of accuracy. This will help you to estimate project design costs more accurately and gauge the steps needed to bring a project to a successful conclusion.

Questions to consider after completing this chapter:

1. How does communication design work within the constraints of print and media?
2. How does the creative process relate to strategic problem solving?
3. How is the creative process related to the design process?
4. What are the critical phases of the design process?
5. How does project research help to define a communication problem?
6. What are some examples of brainstorming techniques that generate multiple concepts based on a common message?
7. How does using a metaphoric device generate concepts?
8. How do concepts translate into messages within a visual form?

Chapter 3. Design Elements, Design Principles, and Compositional Organization

3.1 Introduction

Alex Hass

Learning Objectives

- Utilize basic design principles relating to visual composition
- Define design terminology pertaining to form
- Describe organizational systems and core principles for layout grids
- Differentiate between typographic categories
- Establish a visual hierarchy within a layout
- Express ideas using the principles of composition and form

Communication design is essentially the crafting of a message meant for a specific section of the public. This written message is infused with meaningful and relevant visual components. The composition of these components should amplify, clarify, and enhance the message for the viewer. To assist in making sound design choices, a designer applies principles of composition and principles of organization to the design elements selected for a project.

Understanding how to utilize the fundamentals of design elements, principles, and composition is necessary to be able to confidently move through the stages of the design development process and build a project from the initial design brief to the final published design work.

Definitions from various design sources about what comprises a design element are consistent for the most part, but defining design principles is not as consistent and varies from one text to the next. Marvin Bartel's (2012) definitions of these categories are both simple and on point. He defines a visual element as any "basic thing that can be seen," and a design principle as a method for "arranging things better." Also included in this chapter are organizational systems that can focus and direct the overall direction a composition will take.

3.2 Visual Elements – Basic Things That Can be Seen

Alex Hass

Point, line, and plane are the building blocks of design. From these elements, designers create images, icons, textures, patterns, diagrams, animations, and typographic systems. (Lupton & Phillips, 2014, p. 13)

Figure 3.1 Design using points, lines, planes

Point

A point is a precise position or location on a surface. In purely mathematical terms, a point marks a set of coordinates — it has no mass at all. In this objective definition, a point is essentially a place. Visually, a point is a dot and therefore the basic building block of every variation of line, texture, and plane.

Subjectively, the term *point* has a lot of power. *Point* can direct attention, be the focus of attention, create emphasis, and cut through veiled information. The compositional term *focal point* brings the objective and subjective together by being the first place the eye is drawn to in a composition and usually contains the most important piece of visual communication.

Line

Figure 3.2 Lines (by Ken Jeffery)

A line is the second most basic element of design — a line is a collection of points arranged in a linear manner (see Figure 3.2). A line connects two points, or traces the path of a movement. A line can be actual or implied — for instance, as a composition of two or more objects in a row. Lines in nature act as defining planes — examples are a horizon or the silhouette of a forest against the sky. Long straight lines do not often occur in nature, and therefore when they are present, they tend to dominate the landscape visually. Natural settings are usually parsed by the eye into shorter sequences of curved or straight lines and organic shapes.

When made by the hand, a line is created by the stroke of a pencil, pen, brush, or any mark-making tool. These lines can be thin or wide, and are expressive and distinct, reflecting the texture of the tool used to make them. Lines can create a plane (a shape) by being clustered together or by defining a shape. If the line is thickened, it changes and becomes a plane. When lines are made digitally, they can acquire many of the same qualities possessed by hand-drawn lines through the application of effects.

Plane

Figure 3.3 Planes

Like lines, planes (shapes) can be organically made or they can be geometric, as in the example shown in Figure 3.3. A plane is a flat surface that has defined borders. “A line closes to become a shape, a bounded plane” (Lupton & Phillips, 2014, p. 38). Planes are excellent compositional tools for clustering visual elements into visual fields. A plane can also act as a separating device and allow the viewer to see that one section of information is not linked to another.

In design software, a vector graphic is a shape created by defining its parameters with a line, and then filling it with a solid or textured fill. Grids help to create and define typographic planes that float or interact with solid planes of image, texture, or colour. In the physical world, everything is composed of shapes that are either two- or three-dimensional. How you choose to organize and arrange the planes in your photograph, your illustration, or your design will structure the composition and determine not only how the elements intersect with one another but also how the viewer interacts with the composition.

Colour

Figure 3.4 Colours

Graphic design has evolved over the last two centuries from a craft that designed text and images primarily in black and white for books and broadsheets, to a craft that works with full colour in analog and digital media and on every kind of substrate. Controlling and effectively using colour to support communication is now more important than it has ever been. Both media and advertising have become very sophisticated over the last few decades and are adept at creating exciting, sensuous, and energetic environments that are crafted with the skillful use of colour and texture. The public, in turn, has absorbed these unprecedented levels of image saturation with a variety of outcomes. One is an expectation that the visual palette match and enhance the message. A second outcome is a high expectation for strong and authentic visuals of places or objects. A third outcome is a cultural nostalgia for earlier looks created by various devices. Examples like 8-bit graphics or 1950s Kodachrome both possess unique colour and texture palettes and have properties the public can discern. When one of these nostalgic colour palettes is applied to an image, it adds another layer of meaning to the work, and that meaning has to make sense for the viewer.

The explosion of tools for making and sharing digital photography and graphics also reveals how good the general public has become at crafting visuals with relevant atmosphere and texture. The bar has been raised very high with colour use in contemporary times, and understanding colour basics is an absolute necessity.

RBG and CMYK Colour Spaces

Given that design and colour are united in every project, it is important to realize that there are two colour systems, and often a project needs to work in both. Digital media works in the additive colour system, and its primary colours are red, green, and blue (RGB). In this system, the absence of colour equals black, while combining all colours results in white. RGB is the colour system of visible light (see

Figure 3.5). This light system is called *additive* because the three primaries together create all the hues in the spectrum.

Subtractive colour is the system needed for print media, and its primary colours are cyan, magenta, yellow, and black (CMYK), as shown in Figure 3.5. In CMYK, the absence of colour equals white, while combining all colours creates black. Both of these systems have many overlapping colours but their colour spheres are not exactly the same. Understanding where the overlaps exist and where they don't correspond is vital to the success of a project. If your print materials cannot be replicated on screen, you will have a major design problem that will have to be corrected. Always choose colours that will work in both systems.

Figure 3.5 Primary colours for the additive and subtractive colour schemes

Environment is another aspect of colour choice that is very important. Both the natural world and the world within the screen vary from moment to moment and screen to screen. Colours are affected and influenced by the amount of atmospheric light available to them as well as by the colours in contact with the object they are viewing. Texture also changes our perception of a colour as does the brightness or darkness around it.

However much a designer hopes to define the parameters of a colour palette, there will always be unknown factors influencing the palette on the viewers' end. Create a palette that is focused enough to create the right atmosphere and energy level for your project, but one that doesn't rely too heavily on a specific colour. Careful, considered colour use will help define a message and create a mood that supports the composition and concept of a design work. Always create a palette that will work with both colour systems and also be robust enough to work in less than optimal environmental circumstances.

Negative Space

Negative space, which is also called *white space*, is the visually quiet area that surrounds the active area of a composition (see Figure 3.6). It is also referred to as figure/ground, and has a very important role in composition as it shapes the visual perception of the subject. Without negative space, there is no positive space — the effect is similar to seeing a polar bear in a snowstorm. Negative space is often thought of as as passive and unimportant, but the active elements or 'figure' are always perceived in relation to their surroundings by the mind of the viewer. The composition of the negative space frames and presents the active elements in a flat or dynamic way. If the surrounding area is busy with many other elements, the focal point loses its power because the elements all have a similar visual value. The works of Gustav Klimt exhibit this quality.

Figure 3.6 Example of negative or white space

If, on the other hand, the work is balanced and the negative space is active, it brings energy to the form and its space. The focal point or figure increases its visual power because there is contrast for the eye. Another way to look at this is to see that the range or gamut of visual activity is increased and therefore the experience is more satisfying to the eye.

When designers play with reducing or confusing positive and negative space, they create ambiguity. Ambiguity creates tension, which increases the interest of a composition to the viewer and also increases the visual energy of a design. There are three types of figure/ground relationships.

Stable figure/ground is the most common type. The positive element is clearly separate and defined against its negative space. A good example of this is text blocks in magazines or books.

Reversible figure/ground is the second type and is found in most of the work of M.C. Escher. Both the positive and negative space delivers ‘active’ information that feels equal to the eye and therefore creates a toggling effect in the viewer. One shape is comprehended while the other acts as its negative space, then the opposite happens and the negative space becomes meaningful and its opposite becomes the neutral ‘holding’ space.

Ambiguous figure/ground creates a confusing lack of focal point. The eye searches for a dominant visual ‘starting point’ in the composition but can’t find one. Often this creates energy, and if the effect is compelling, it invites the viewer to stay with the work for a long period of time, absorbing all of the visual information.

Figure 3.7 FedEx express truck

Designers often utilize figure/ground in the crafting of symbols, wordmarks, and logos because of its capacity to create meaning with the space surrounding a mark. An excellent example of figure/ground is the FedEx wordmark (see Figure 3.7). The negative space needed to define the letterforms also augments their meaning by creating a forward pointing arrow. In print design, negative space can also allude to what is outside the frame and makes the field of the page or poster larger than it physically is. On a static or moving screen, negative space has the ability to change the flow of time, to introduce a break, or to create space around an important point.

Composing strong figure/ground tension is an excellent skill to acquire for designers of any media. Crafting white space eventually becomes as important to a designer as selecting the words and the elements of a project. Composing the negative spaces of a composition will allow you to vary visual emphasis of the elements, and control and increase the visual energy overall.

Texture

Figure 3.8 Example of texture

Texture is a visual and a tactile quality that designers work with (see Figure 3.8). Texture is used both in composition and also on the printed substrate or media space. Designers create textures for their projects with anything at hand. A texture can be made with typography, generated in raster or vector software like Photoshop or Adobe Illustrator, or by using a camera and capturing elements in the material world.

Using texture thoughtfully will enhance a visual experience and amplify the context for the content. Often adding texture adds visual complexity and a bit of visceral depth to a two-dimensional design.

project. It can also tie one piece of design to another, or become a defining element of a brand or a series of communications.

The tactile aspect of a design work comes into play with the choices we make for the substrate we print on. The surface can be smooth or rough, glossy or matte, thick or thin, translucent or opaque, paper, plastic, concrete, metal, wood, or cloth. Paper can even have two or more of these qualities if we augment the original look of the paper with layers of varnish that reverse the tactile effect of the substrate. Often the choice of substrate is most effective if it is sympathetic to or contrasts with the concept and content of the piece. The choice of substrate texture affects how the viewer perceives the content — both physically and optically. Glossy substrates often feel sophisticated, hard, and cold. They are imbued with a sense of precision because the ink sits on top of the surface of the paper and retains almost all of its original integrity. A textured matte paper feels organic, accessible, and warm because the ink is partially absorbed by the paper, and is therefore influenced by and fused to its softer characteristics.

Pattern is part of the element of texture, but because of its special ability to hold content that is meaningful, and its long and significant cultural history, it deserves a special mention. All patterns can be reduced to dot and line and are organized by a grid system of some kind. Their ‘flavour’ is a reflection of the culture and time they come from and of the materials that created them. Patterns can be a subtle addition to the content of any design work. A pattern can be created using a relevant graphic (like a logo) or repeated multiple times, or it can support the organizational principles developed by the designer in a decorative way; for example, if a grid is based on the square and the texture of the pattern is also based on the square.

When the pattern is seen as a whole, its individual components melt away and lose their identity to the larger field of the pattern. This ability to focus on a pattern in multiple ways creates a second purpose for the graphic element (such as a circle, a square, a logo, or symbol) the designer has used. In modern design practice, pattern is an opportunity to augment the clean and simple material surfaces we work with and ornament a page or a website with a relevant texture.

Typography

Figure 3.9 Typography

Typography is the medium of designers and the most important element we work with (see Figure 3.9).

Typography not only carries a message but also imbues a message with visual meaning based on the character of a font, its style, and its composition. Words are meaningful in and of themselves, but the style and composition of words tells a reader you are serious, playful, exciting, or calm. Typography is the tonal equivalent of a voice and can be as personal or as general in flavour.

Typography traditionally has two functions in most design projects. One function is to call attention to or to ‘display’ the intent of a communication. This function is called titling or display typography and it is meant to call attention to itself. The second function is to present the in-depth details of a communication within a text block. This function requires a different typographic approach — one that is quiet and does not call attention to itself. Instead, it is intended to make the content accessible and easy to read.

Font Categories

There are many ways to categorize and subcategorize type. This overview discusses the seven major historical categories that build on one another. Serif fonts comprise four of these categories: humanist, old style, transitional, and modern. Italics, first designed in the 1500s, have evolved to become part of a font ‘family’ and were at one time a separate category. They were initially designed as independent fonts to be used in small pocket books where space was limited. They were not embraced as text fonts, but were considered valuable for adding emphasis within a roman text and so became part of the set of options and extensions a font possessed. The trajectory of use is the opposite for the sans serif category. Sans serif fonts have historically been used for display only, but in the 20th century, they became associated with the modern aesthetic of clean and simple presentation and have now become very popular for text-block design. Egyptian or slab serif fonts can be used as either display or text depending on the characteristic of the font design.

Blackletter

Schriftbeispiel Frühling
Schriftbeispiel Maximilian
 Schriftbeispiel Deutsche Zierschrift
Schriftbeispiel Deutsche Anzeigerschrift
 Schriftbeispiel Wilhelm-Klingspor-Schrift
Schriftbeispiel Wallau
 Schriftbeispiel Claudius

Figure 3.10 Example of Blackletter type

Blackletter was the medieval model for the first movable types (see Figure 3.10). It is also known as

Block, Gothic, Fraktur, or Old English. The look of this font category is heavy and dark. The letterforms are often condensed and put together tightly in a text block creating a dark colour (tone) for a page — between 70% and 80% grey. To put the tone in context, the usual tone of a modern text page is between 55% and 70% grey. The look of the letterforms makes it hard to read the page, because legibility was not their first function as it is today. The beauty of the font and the form of the book was the primary goal for early publications. Books were considered to be objects of wealth and beauty, not solely as a means to convey information.

Humanist

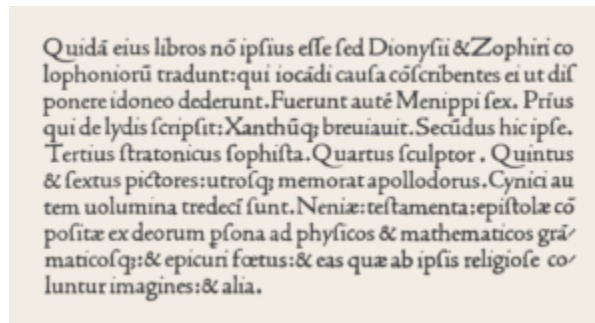

Figure 3.11 Example of Humanist type

Humanist fonts are also referred to as Venetian, because they were developed in and around Venice in the mid-15th century (see Figure 3.11). Their design was modelled on the lighter, open serif letterforms and calligraphy of the Italian humanist writers. The designers strove to replicate many of the characteristics found in this writing style, including multiple variations of a glyph (letterform) that a written document possessed. For instance, a font could have up to 10 different lowercase a's to set a page with. Humanist types were the first roman types. Though they were much easier to read and lighter on the page than blackletter, they still created a visually dark and heavy text block in contrast to the fonts we have become accustomed to. Humanist fonts have little contrast between the thick and thin strokes — the strokes are usually heavy overall. The x-height of a humanist font is small compared to contemporary fonts, and this impedes quick comprehension and legibility. Humanist fonts are not often used for these reasons, though they are well respected because they are the original model so many other fonts are based on. It is important to remember that these fonts were a perfect match to the earliest printing technologies and that those presses could not have printed our light and delicate fonts. Fonts have evolved alongside the technological advancements of the printing industry.

Examples of humanist fonts include Jenson, Centaur, Verona, Lutetia, Jersey, and Lynton.

Old Style

Figure 3.12 Example of Old Style type

Old style fonts, also known as Garalde fonts, are the next leap in font design, and their stylistic developments were driven by the technological advancement of presses and the improved skills of punchcutters (see Figure 3.12). Font designers began to explore the possibilities of their medium — both the metal of the punches and the abilities of the presses and their papers. The letterforms became more precise, their serifs more distinct. The contrast of the stroke weights was also increased, and the presses held true to the design and didn't distort them. The aim of these new fonts ceased to be about replicating the look of handwriting and more about refining the letterforms to create a lighter overall tone.

Examples of old style fonts include Goudy Old Style, Granjon, Janson, Palatino, Perpetua, Plantin, and Sabon.

Transitional

Figure 3.13 Example of Transitional type

A few centuries later, font design was again refined, and this time the impetus came from France and the Enlightenment movement. Fonts were created along the rationalist principles of the times. The strokes were contrasted further with very thick main strokes and very thin sub-strokes, and the serif, which capped the stroke, did not use bracketing (the rounding underneath the intersection of the two strokes). The letterforms took on a look that implied they were constructed mathematically and anchored within a grid. These new fonts broke with humanist and old style tradition and ceased to reference calligraphy.

Examples of transitional fonts include Baskerville, Bookman, Fournier, and Joanna (see Figure 3.13).

Modern

Figure 3.14 Example of Modern type

Modern fonts are also known as Didones and take the contrast started by the transitional fonts much, much further (see Figure 3.14). Bodoni is an excellent example font as nearly everyone can bring to mind the extreme contrast of its thick and thin strokes. The Frenchman Didot and the Italian Bodoni were the first to bring this design style to the public. Its major attributes align with the Romantic period's aesthetics.

Romantic letters can be extraordinarily beautiful, but they lack the flowing and steady rhythm of the Renaissance forms. It is that rhythm which invites the reader to enter the text and read. The statuesque forms of Romantic letters invite the reader to stand outside and look at the letters instead. (Bringhurst, 2004, p. 130)

The major characteristics of modern fonts are extreme contrast between thick and thin strokes, clean, unbracketed, hairline serifs, and a completely vertical axis. These fonts have an almost mechanical look because of their precise, sharp, and clean appearance. They also possess an elegance that compliments the time period they emerged in. Modern fonts are often used as display fonts and can sometimes be used for text, though very carefully.

Examples of modern fonts include Fenice, Zapf Book, New Caledonia, Bodoni, and Didot.

Egyptian

Figure 3.15 Example of Egyptian type

Egyptian is also known as slab serif, square serif, or mechanical (see Figure 3.15). This category of font was created in England in the 1880s — a design expression of the industrial revolution. The category was named Egyptian because of the popularity of all things Egyptian after Napoleon’s return from a three-year Egyptian expedition. The name of the style has nothing to do with any element of Egyptian culture. The style was created initially for display copy, but over the centuries, fonts like Clarendon have become popular for setting text blocks because they contain the quality of objectivity and yet still feel traditional.

Examples of Egyptian fonts include Officina Sans and Officina Serif, Clarendon, and every typewriter font.

Sans Serif

Figure 3.16 Example of Sans Serif

Sans serif fonts have existed since ancient times, but it was only in the late 19th century that font designers began to consider removing serifs and letting the letterforms stand on their own (see Figure 3.16). These fonts were initially considered appropriate only for titling and display purposes, and only became text fonts in the hands of the 20th-century modernists. The first sans serif forms were created on the early humanist and old style calligraphic forms, but eventually the forms were influenced by objective modernist principles and geometry.

Examples of sans serif fonts include Univers, Helvetica, and Akzidenz-Grotesk.

3.3 Compositional Principles – Strategies for Arranging Things Better

Alex Hass

We have many words for the frustration we feel when an interface isn't directing us to what we need to know. Loud, messy, cluttered, busy. These words. . . express our feeling of being overwhelmed visually by content on a screen or page. We need them to express how unpleasant a user experience it is to not know where to direct our attention next. (Porter, 2010, para 1)

If everything is equal, nothing stands out. (Bradley, 2011)

The proper composition of visual elements generates not only visual stability, it enhances mood through composition and generates order that prevents visual chaos. Designers use compositional rules in their work to make the reader enter their work and experience a design environment that is calm yet exciting, quiet yet interesting. A magazine designer, for example, creates a grid and applies an order to the typographic elements creating a comprehensible hierarchy. This design system is interpreted in different ways, in pages and spreads, issue after issue. If the organizational system is versatile and planned with thought and depth, it can be used to produce unique and exciting layouts that remain true to the rules determined for the overall system initially designed. Organizational principles create a framework for design without determining the end results.

Compositional rules can be used to generate content as well as organize it. The Bauhaus artist and designer Laszlo Moholy-Nagy created a series of paintings by calling in a set of instructions to a sign painter using the telephone. Here is his account of the experience, written in 1944:

In 1922 I ordered by telephone from a sign factory five paintings in porcelain enamel. I had the factory's color chart before me and I sketched my paintings on graph paper. At the other end of the telephone, the factory supervisor had the same kind of paper divided in to squares. He took down the dictated shapes in the correct position. (It was like playing chess by correspondence). (Moholy-Nagy, 1947, p. 79)

Designing visual elements into a strong composition is a complex endeavour on its own, but increasingly designers are being asked to create vast compositional systems that other people will implement. Much like Laszlo Moholy-Nagy, designers need to be able to make strong compositional systems and also convey how their systems work, how to apply their rules, and how to apply them so they retain a relevant freshness.

Alignment

Figure 3.17 Alignment

Alignment refers to lining up the top, bottom, sides, or middle of a text, composition, or grouping of graphic elements on a page. Often a design composition includes a grid where the alignment of text blocks is dictated by the design of the columns of the grid (see Figure 3.17).

Typographically, horizontal alignment includes flush left (also called left justified or ragged right), flush right (also called right justified or ragged left), centred, and fully justified. Vertical alignment in typography is usually linked to baseline alignment. A baseline grid exists in digital software that is meant for layout of type and is the invisible line where font characters sit.

Contrast

Contrast is a visual device that increases the special character of both elements that have been paired. Contrast assists composition by creating focal points, and adds energy and visual range to a composition. Using contrast enables us to distinguish the qualities of one object by comparing differences with another. Some ways of creating contrast among elements in the design include the use of contrasting colours, sizes, and shapes. Johannes Itten, a design instructor and artist at the Bauhaus focused his research on the concept of contrast in both composition and colour. Itten's list of contrasts can be applied to both the composition and the atmosphere of a design work. His list includes these pairings: large/small, hard/soft, thick/thin, light/heavy, straight/curved, continuous/intermittent, much/little, sweet/sour, pointed/blunt, light/dark, loud/soft, black/white, strong/weak, diagonal/circular. No design makes use of only one kind of contrast, but usually one dominates the others.

Colour Contrast

Johannes Itten also worked with contrast in his seminal theory of colour and determined that there are seven kinds of contrast.

1. *Contrast of hue* occurs when a hue or colour is separated by being outlined in black or white lines. White lines weaken the 'strength' and appearance of the colour and the colours around the white lines seem darker. In contrast, a black line around a colour strengthens the appearance of the colour, while the colours around the black lines appear to be lighter.
2. *Light-dark contrast* is the contrast between light values and dark values.
3. *Cold-warm contrast* refers to the contrast between cool and warm colours. Warm colours are the red, orange, and yellow colours of the colour wheel, while cool colours are blue, green, and purple.
4. *Complementary contrast* is the contrast between colours directly opposite each other on the colour wheel.
5. *Simultaneous contrast* occurs between two colours that are almost complementary. One colour is one section to the left or right of the complementary colour of the other.
6. *Contrast of saturation* refers to the contrast between intense colours and tertiary or muted colors. Muted colours appear duller when placed next to intense colours, and intense colours appear more vivid when next to a muted colour.

7. *Contrast of extension* refers to the contrast between the area of one colour and another. Different areas of one colour are needed to balance another.

For text, contrast is achieved by using varied colours, serif and sans serif, type styles that are not often paired, or type in place of an image. As contrast in elements diminishes, the elements begin to feel similar, and the level of visual interest decreases.

Emphasis

A focal point in a composition draws the eye to it before the eye engages with the rest of the visual information. This is called *emphasis* and is achieved by making a specific element gain the attention of the eye. Emphasis is created in graphic design by making only one focal point and clearly emphasizing it by placing the elements on the page in positions where the eye is naturally drawn to the proper entry into the work. Designers rely on additional compositional principles to support the hierarchy of a composition such as contrast, repetition, or movement.

Designers use emphasis to assist viewers in identifying the relative importance of each element in a composition. Emphasis is strongly linked to visual hierarchy. Both emphasis and visual hierarchy create order for the viewer, allowing the eye to see the first element of importance, then the second, then the third, and so on. Graphic elements gain or lose emphasis by changing in size, visual intensity, colour, complexity, uniqueness, placement on the page, and relationship to other elements.

Movement

Figure 3.18 Example of movement

Movement is made by creating visual instability — like motion in a photograph that blurs the image, as shown in the example in Figure 3.18. Creating the illusion of movement photographically or artistically is not difficult because a blur translates into movement in the mind of the viewer. However, it is not

the only option for a designer. A composition can also achieve movement if the graphic elements are arranged in a way that directs the eye to move in a specific direction — usually by creating a diagonal that takes the eye up to the right corner (forward motion) or down to the left corner (backward motion). Movement can also be created using overlapping planes that imply depth and distance by becoming progressively smaller and lighter in tone (mimicking depth). Using typography as a visual medium is also an option. Overlapping the text blocks and/or sentences effectively creates both depth and movement (though it destroys legibility). David Carson is a designer who often uses this technique to create movement in his work.

Scale

Varying scale (size) is one of the major tools in the designer’s toolbox. Changing scale is important on two levels. The first is purely compositional — a composition needs variety in the size of its elements to be dynamic and effective. If all the elements have the same visual weight, the composition will be flat. Another aspect to varied scale is conceptual. If a design visually distorts the size relation of one element to another, the viewer is instantly engaged in discovering why. This is a great method to engage the viewer and add a twist to the message embedded in the design. A great example of this is the [‘think small’ ad campaign](#) of the 1960s for Volkswagen Beetle.

The series is witty and engaging and plays on how we perceive size. This distortion is witty and playful, and presents smallness as desirable. Subtle scale differences do not make much visual impact, but large ones are very dramatic. The concept and context of a project should determine the relationship of scale differences for a composition. Large differences in scale are suited to dramatic and energetic design content, while smaller differences in scale are appropriate for professional and institutional content.

Proximity and the Gestalt Theory of Visual Relationships

Proximity of elements is part of Gestalt theory, which is a framework of spatial relationships developed in the 1920s by the German psychologists Max Wertheimer, Wolfgang Kohler, and Kurt Koffka. The term Gestalt means *unified whole*, and points to the underlying conceptual structure of this framework. Gestalt works because the mind seeks to organize visual information. A composition created using Gestalt principles predetermines how each of the elements within it interacts with the others spatially. In this system of relationships, close proximity of objects, regardless of shape, size, or content, indicates a connection. There are six basic Gestalt principles: (1) similarity, (2) continuation, (3) closure, (4) proximity, (5) figure/ground, and (6) symmetry and order.

Similarity

Figure 3.19 Similarity

When visual elements have a similar shape or look as one another, a viewer will often connect the discrete components and see a pattern or grouping (see Figure 3.19). This effect can be used to create a single illustration, image, or message from a series of separate elements. Similarity of medium, shape, size, colour, or texture will trigger a sense of similarity. The sense of grouping will be strengthened or weakened by increasing or decreasing the commonality of the individual elements.

Continuation

Figure 3.20 Continuity

Continuation is the tendency of the mind to see a single continuous line of connection rather than discrete components (see Figure 3.20). The eye is drawn along a path, line, or curve, as long as there is enough proximity between objects to do so. This tendency can be used to point toward another element in the composition, or to draw the eye around a composition. The eye will continue along the path or direction suggested by the composition even when the composition ends, continuing beyond the page dimensions.

Closure

Figure 3.21 Closure

Closure is a design technique that uses the mind's tendency to complete incomplete shapes (see Figure 3.21). The principle works if the viewer is given enough visual information to perceive a complete shape in the negative space. In essence, the mind 'closes' a form, object, or composition. In the example above, the triangle is formed by the viewer's mind, which wants to close the shape formed by the gaps and spaces of the adjacent circles and lines. The partial triangle, outlined in black also hints at the missing shape.

Proximity

Figure 3.22 Proximity

Proximity is an arrangement of elements that creates an association or relationship between them (see Figure 3.22). If individual elements are similar, they will probably be perceived first as a whole and second as discrete components. If, like the example above, some of the components form to create a large ‘whole,’ similar elements positioned away from the main shape will also be associated with the large shape. In this case, the viewer interprets them as falling off or away from the main shape. The shapes used do not have to be geometric to create the effect of proximity. Any components have a strong commonality in shape, colour, texture, size, or other visual attribute can achieve proximity. Proximity can also be achieved with dissimilar shapes and textures if cleverly and conceptually composed.

Figure/Ground

Figure 3.23 Figure/Ground

Figure/ground was discussed earlier, but it is part of Gestalt theory, so we present it here again. This principle describes the mind's tendency to see as two different planes of focus, information in both positive and negative space (see Figure 3.23). It works if those spaces are suggestive enough in their composition.

Symmetry and Order

Figure 3.24 Symmetry

Symmetry and order follow the premise that a composition should not create a sense of disorder or imbalance (see Figure 3.24), because the viewer will waste time trying to mentally reorder it rather than

focus on the embedded content. The photographic example in Figure 3.25 is composed symmetrically and allows the viewer to concentrate on the figure in the centre. Achieving symmetry in a composition also gives the composition balance and a feeling of harmony.

Figure 3.25 Example of symmetry and order

Rhythm

Rhythm is integral to the pacing of a design composition and is also necessary for creating a pattern, as used in the example in Figure 3.26. The pacing of a repeating motif or element at regular or irregular intervals within a design determines the energetic quality of a composition; it also creates a consistent and unifying backdrop for the introduction of new elements.

Rhythm is the effect produced in a magazine or book by varying the placement of elements within the grid structure. The changes in the density of elements and visual tones of the spreads translate into a rhythmic visual energy as the energy of each page grows or shrinks. Rhythm is the glue that connects one page to the next; it reveals recurrent themes and creates movement, tension, and emotional value in the content. When viewers understand the rhythm of a book, a magazine, or a website, they will also appreciate the variations that break with or punctuate the rhythm and create interest, change, or tension.

Figure 3.26 Example of rhythm

Repetition

Repetition creates visual consistency in page designs or in visual identities, such as using the same style of headline, the same style of initial capitals, and the same set of elements, or repeating the same basic layout from one page to another (see Figure 3.27).

Excessive repetition, however, creates monotony. This usually leads to viewer boredom and dull, uninteresting compositions for the designer. Be sure to create a design system that allows the repetitions within it to be lively and interesting page after page. The example above uses a simple set of rules, but because the rules allow for colour and compositional changes, each discrete component is as interesting on its own as it is within the whole. If you cannot avoid excessive repetitions, try to add some visual breaks and white spaces where the eyes can rest for a while.

Figure 3.27 Example of repetition

Balance

Balance and symmetry are important design qualities because they are deeply embedded in human DNA. Because our bodies are symmetrical, we have a strong association and satisfaction with centred, symmetrical design. Balancing visual elements compositionally calms the tensions and grounds the design (see Figure 3.28). This is important if you wish to convey a sense of stability to the viewer. When we look at a design, we use our innate sense of what constitutes ‘right balance’ to assess its stability. If that stability is missing, we feel tension, which can counteract the core of the message. Centred design compositions work very well for stable, security-inspiring content, but what about content that demands attention, or tension, or excitement?

When a centred (or stable) composition is not desirable, developing an asymmetrical composition is the best strategy. Asymmetry has been explored in graphic design for the last 150 years, and designers continue to discover new strategies that feel fresh. Asymmetry has no empirical rules but is guided by balancing the distribution of main elements around the space of a composition in an unexpected way. Contrast and counterpoint are the main tools of composition in asymmetry — large shapes balance small ones; intense colours balance neutrals. Creating asymmetrical design is not easy because there are no firm rules to follow, but it is exciting to create and exciting to see for exactly the same reason.

by experimenting with, and breaking free from universal rules of visual structure. It is important is to match the structure of the composition to the needs of the project.

Typographic hierarchy is very important in design. A body of text is made more comprehensible by imposing order through a system of titles, subtitles, sections, and subsections. Hierarchy is created when the levels of the hierarchy are clear and distinguishable from one another. Subtle signs of difference are not effective. Typography acts as a tonal voice for the viewer, and must create clear variation in tone, pitch, and melody.

Hierarchy is usually created using similarity and contrast. Similar elements have equality in typographic hierarchy. Dominant and subordinate roles are assigned to elements when there is enough contrast between them. The bigger and darker an element is, the more importance it has. Smaller and lighter sizes and tones imply lesser importance.

Every hierarchy has a most important level and a least important level. The elements that fall between the two are ranked according to size and position. However, if you subdivide the text with too many levels, the contrast between different levels will blur their differences in the hierarchical order.

A good strategy to follow with text design is to apply three levels of typographic hierarchy.

Title

The function of a title is to attract the reader to the content of the text block. Often, the title is visually ‘flavourful’ and possesses a strong visual dynamic and energy.

Subtitle

Second-level typography gives the reader the ability to distinguish between types of information within the text block. This level of type includes subheads, pull quotes, captions, and anything else that can help detail and support understanding of the text-block information.

Text block

The text block is the content. As opposed to the ‘display’ function of the title and subtitle, the function of the text block is to make the content legible and easy to digest visually. Readers should be able to decide if they want to read this level based on primary (title) and secondary (subtitle) type levels.

Typically, a typographic hierarchy will convey information from general to specific as it progresses from title to text block. The general points presented in the title will be the most important and will be seen by most everyone. Think of how a newspaper is scanned for interesting news items: If readers are interested in the title, they may choose to read more detailed and in-depth information in the associated text block.

3.4 Organizational Principles

Alex Hass

Compositional organization is complex, but even more so when applied to typography. Typography is a complicated medium to work with as it contains two levels of information (display and content), and requires its components to be read in proper sequence with proper emphasis, good legibility, and strong contrast to the substrate. Many elements need to be organized to allow the reader a seamless experience when reading the content. Designing with type requires adept handling of the hierarchy, refining and designing the display elements for focal emphasis and also refining the quiet details of the text block so it sits perfectly and quietly in its space.

Think of these organizational systems as ‘large picture’ constraints. Constraints (rules) allow a designer to focus on the other aspects of a project. Designers make myriad decisions about concept, style, visuals, form, font, size, spacing, colour, placement, proportion, relationships, and materials. When some factors are determined in advance, the designer is able to spend time with the other parts of the project. A well-defined constraint can free up the thought process by taking some decisions off the table. The following eight organizational systems cover composition for type (but can also be applied to general composition), including the traditional ordering system of the grid.

Grid

A grid is a network of lines that structure the placement of elements and create relationships between them. A grid divides a design space into vertical and horizontal divisions. The grid is a bridge between a design rationale and the beginning of implementation for each project, converting a concept into a structured space. It is an exceptional tool for composing, arranging, and organizing every kind of visual element. The grid usually works invisibly in the background, but it can become an active, visible element as well. Designers use grids in a variety of ways. They can be very disciplined about adhering to their grid structure from the beginning of a project, or use it as a starting point for composition and order.

Grid systems create a formal composition in comparison to more casual compositional approaches like transitional or random structures. Grids are often used in publication and web design because they introduce consistency and guide hierarchy. Consistent margins and columns create an underlying structure that unifies the multiple pages of a document or website, and makes the layout process more efficient.

The plan for the grid comes from the content and concept of the design project. The objective in creating a grid is to set up the relationships between elements in a way that stays true to the concept. For instance, if your publication is a book of poetry, the grid must have generous amounts of negative space and generous leading. If, on the other hand, your publication is a daily newspaper, the spacing relationships cannot be so generous, and have to clearly show which article relates to which image. Hierarchy of information must be very clear as well, and should reveal which news item is most important and which is least important. A well-made grid will naturally allow the designer generous scope for variation in

image style, text size, and graphic style. Often, a grid that is complex allows for some freedom where the designer can introduce a new element or effect.

A grid activates the entire surface of a project by making all of it available for active elements. It helps create both stable symmetrical and dynamic asymmetrical compositions. By breaking down space into smaller units, grids encourage designers to leave some areas open rather than fill up the whole page.

Types of Grids

Figure 3.30 The golden section

The golden section is also known as the golden ratio, golden mean, or divine proportion, and it is found in mathematics, geometry, life, and the universe — its applications are limitless (see Figure 3.30)

The golden section is a ratio — a relationship between two numbers — that has been applied as an organizational system in art, design, and architecture for centuries. Expressed numerically, the ratio for the golden section is 1 : 1.618. The formula for the golden section is $a : b = b : (a+b)$. In other words, side a is to side b as side b is to the sum of both sides.

Graphic designers use the golden section to create grids and layouts for websites and books. Photographers use it to compose the focal point of an image and also to compose the elements found in an image.

Single-Column Grid

Figure 3.31 Single-column grid

A single-column grid is an excellent approach if the content a designer is working with is formatted in a simple manner (see Figure 3.31). Content that is appropriate for a single-column grid consists of main text for the text block, a few levels of display type, possibly some images, and finally page numbers.

The main column of this style of grid must sit properly on the page, held in place by the negative space that surrounds it. To determine the right amount of negative space on the top, bottom, and sides of the page, a designer usually considers facing pages as a spread. In books and magazines, the two-page spread, not the individual page, is the main unit of design. The designer determines the right amount of negative space on the top and bottom, gutter (inside margin), and outside edge. The spread is often symmetrical, and the pages mirror one another.

Multi-Column Grid

Figure 3.32 Multi-column grid

When a designer creates a grid for a document that is complicated, he or she may use multi-column grids because they allow for a complex hierarchy and provide more options for integrating text and visuals (see Figure 3.32). The more columns you create, the more flexible your grid will be. You can use the grid to articulate the hierarchy of the publication by creating zones for different kinds of content. The columns act as visual units that can be combined or kept separate. A photo can span several columns or be reduced to the width of only one. A text can also occupy a single column or span several.

Hang Lines

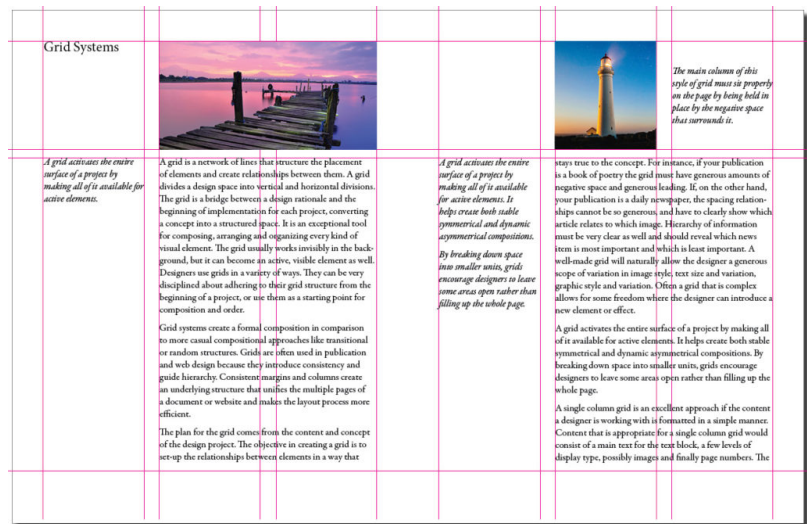

Figure 3.33 Hang lines

In addition to creating vertical columns in a grid, you can also divide the page horizontally. Often, a designer determines the placement of hang lines (see Figure 3.33) by applying the rule of thirds

(breaking up the horizontal plane into three equal parts). This compartmentalization allows the designer to reserve certain sections for images and others for the text block.

Modular Grid

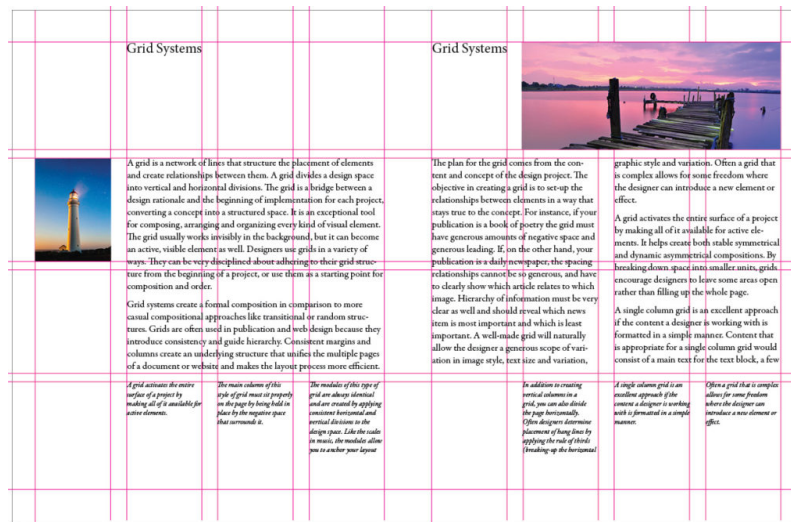

Figure 3.34 Modular grid

The modules of this type of grid are always identical and are created by applying consistent horizontal and vertical divisions to the design space. Like the written notes in a musical score, the modules allow you to anchor your layout elements and typography to a specific rhythm. With a modular grid, the horizontal guidelines are tied to the baseline grid that governs the whole document. Baseline grids serve to anchor most of the elements to a common leading (typographic line spacing). See Figure 3.34.

Baseline Grid

A baseline grid is the horizontal grid that determines where all of the type will sit. You can also use it to determine the placement and edges of your visual and graphic elements. To create a baseline grid, determine the right font, size, and leading for your text block, then go to your baseline grid settings (found with the other grid preferences) and change the baseline grid default (usually 12 pt) to the leading you will be using in your text block.

Axial

The axial system has a simple premise — all elements are arranged on either side of an axis or line. You can centre the axis itself in the composition or, for a more energetic asymmetrical composition, place the axis off centre to either the right or left. This compositional strategy creates a dynamic negative space on the opposite side. To create a more complex composition, designers often employ an axial system combined with another — like the radial or dilatational system (see below). They may also use double-axis compositions with the axes either parallel to each other, or intersecting to create a strong focal point. There are many instances of the axial system in nature — tree trunks, roots, and vines are good examples.

Like these organic examples, an axis does not need to be a straight line — it can be curved, zigzag, or circular.

Modular

Modular organization is a compositional method that utilizes rigour (by constraining the shape) and freedom from structure (modules can be any size and placed anywhere in the space). Modules can also be uniform and contained within a structure (a grid). A module is a fixed element used within a larger system or structure. For example, a pixel is a module that builds a digital image.

Bilateral

The bilateral system is based on mirrored symmetry and is therefore both classic and ubiquitous. Because of its predictability, it is a challenge for designers to work with. Nature exhibits many examples of bilateral composition — the bodies of mammals, the points of a snowflake, and the fractal symmetry of plants are all quickly understood, appreciated, and then dismissed by the viewer. To create a composition based on the bilateral system, a designer must make some part of the composition unusual. The designer can achieve this by moving the axis to a diagonal, off-centre location, which allows the negative space on either side of the bilateral composition to be varied. A second method is to introduce a double axis: the designer uses two columns of bilateral information and varies the size of each.

Radial

The radial system takes its name from the sun — all elements are arranged like rays coming from a central focal point. This is a dynamic compositional strategy as it references dynamic action. Examples of the radial form from the natural world, such as explosions, flowers, spiders, stars, and so on, are all exciting and dynamic. Much like it is difficult to handle the natural objects, reproducing a radial composition is not that easy. There are problems with legibility unless type is very carefully placed and scaled. Every line of type starts and ends in a different place, so continuity is also hard to control. For example, a designer may take a traditional approach so the text reads from top to bottom, or an inverse approach so the text reads from bottom to top. Arranging the text on either side of centre may also be effective. It is important to try placing the type in different positions and in different relationships until it works with the composition and is easy to read.

As in the organizational systems we have discussed, designers can add radial points for a more complex composition or combine a radial system with one that adds stability, such as a grid, axial, or modular system.

Dilatational

Dilatational systems mimic the look of still water when a pebble is dropped into it, creating rings of greater and greater size as they move away from the centre. Like the radial system, this composition has

a strong focal point, but unlike the radial system, the composition creates rings, not rays, that expand from the centre. Other examples of this system are the iris of the eye or representations of sound waves.

Random/Spontaneous

Creating a composition that does not follow any compositional principle is not as easy as it sounds. Finding examples of randomness is also one of the most difficult exercises for design students. Random design does not follow any rule, method, direction, or pattern. If a project calls for randomness, it is best to start with materials that are conducive to spontaneity like Jackson Pollock's paint throws. Allow the elements that fall to organize themselves naturally — eventually, a dynamic and fresh composition should emerge. Random compositions exhibit visual qualities that are not patterned, aligned, or horizontal. Instead, they tend toward compositions that exhibit overlapping, cropping, angling, and textures.

Transitional

The transitional typographic system is defined by the layering of lines of text into informal textured planes and shifting tonal bands. The shapes and bands created with this layering approach are not aligned with one another, and create an overall organic atmosphere. This visual approach is often used in Post Modern design where the clear legibility of text is not as important as the visual atmosphere of the design. Text planes in Post Modernist works point the viewer to the main theme of the message rather than articulate the message in clean, concise text arrangements.

Compositions using the transitional approach have a light, airy look that abstractly imply cloud formations or wood grain patterns rather than solid concrete shapes created by using the grid or axial systems. A transitional composition has lively and active negative space, and can create an excellent ground for a vital focal point if it is in sharp contrast to the rest of the composition.

3.5 Summary

Alex Hass

Exploring the design possibilities that the organizational systems discussed in this chapter possess is an endless undertaking. Once these systems are innately understood individually, a designer can begin to play with layering two systems within one design project. Combining contrasting systems often works well. For instance, an axial system combined with a radial system tempers the axial system's linear focus and anchors and diffuses the rays emanating from the radial shapes. A grid combined with a dilatation system gives the composition both vertical and horizontal structure that is softened by the rounded shapes. Organizational systems give the designer ways to distribute words or images within a structure while allowing negative space into the centre of the design space.

Compositional strategies are design constraints. The definition of a design constraint is to apply or impose limitations on the elements or design of a system. The compositional strategies (systems) discussed above are in fact design constraints, and they should be understood as parameters that assist the designer in the design process rather than as restraints that limit the designer's creativity. Parameters are necessary in every visual system. Applying a visual organizational system also allows the designer to focus on the message and the details of a design project rather than on the structure of the composition that holds the work together. Visual systems create visual unity.

Questions to consider after completing this chapter:

1. Name the design principle that distorts realistic relationships for visual effect and emphasis.
2. Name the three building blocks of design that pertain to form.
3. Describe the eight organizational systems that apply to typography.
4. What are two typographic categories?
5. How many levels of visual hierarchy are needed for hierarchy to exist?

Chapter 4. Colour Management in the Graphic Technologies

4.1 Introduction

Alan Martin

Learning Objectives

- Define the relationship between the observer, the illuminant, and the object in colour appearance
- Describe the physics of light and colour
- Recognize how the eye-brain system affects colour perception
- Explain the components of the CIE colorimetric system, specifically the Lab colour space and Delta E measurements
- Differentiate between device specific and device independent colour models
- Describe the role of colour management in achieving consistent appearance between proofing cycles and final printed production
- Define an ICC profile and describe its application in digital imaging
- Use a spectrophotometer to capture colour data from industry standard targets as the first step in profile creation
- Create ICC colour profiles for standard colour transformations
- Calibrate, profile, and colour manage an LCD monitor
- Describe the application of display, input, and output colour profiles in the electronic prepress workflow
- Apply colour profiles in a variety of industry-standard applications to achieve desirable results for graphic reproduction
- Combine source and destination profiles into a single device link profile for device specific colour transformations
- Apply colour management with ICC or device link profiles in the colour control module of Prinergy's Process Plan for proofing output
- Combine surplus spot colours into a single separation for successful printing-plate production

A knowledgeable application of a colour-managed **workflow** is required for the successful and predictable generation of all colour content in print production and related graphic technologies.

This process requires familiarity with the fundamental colour science that drives the practical steps of **colour profile** creation and colour profile use in our industry-standard software applications. From colour science, we can progress to an examination of the tools and detailed steps required for profile creation and successful profile use.

4.2 Colour Science

Alan Martin

The Colour Event

The first challenge in dealing with colour in graphic reproduction is to learn to think of colour as an *event* rather than as an attribute or characteristic of a particular object.

Colour is an event because it requires the participation of three components at a particular point in time to take place. In addition to the object, we require a light source and an observer. Only with the interaction of these three things — object, light, and observer — can we have a colour event or experience.

We need some help from three branches of science, physics, physiology and psychology, to understand how the object, light, and observer contribute to the colour event. If you like memory aids, you can use the acronym POLO to remind you of the three science P's and the object, light, and observer.

Object

The object and light fall under the domain of physics, while we need both physiology and psychology to describe the observer's role in the colour event.

The object's role is to interact with light, and the object can either reflect light back from its surface or transmit light through itself. Reflectance and transmission are the two potential interactions. The majority of objects are opaque, so most of the time we are dealing with the reflection of light. If an object is semi-opaque, and transmits a portion of light, we refer to it as translucent.

Light

Visible light is a tiny sliver of the total electromagnetic spectrum. The **electromagnetic spectrum** contains all forms of energy, ranging from kilometre-long radio waves at one end and progressing in shortening wavelengths down through microwaves, infrared waves, ultraviolet waves, X-rays, and finally, gamma waves with wavelengths of a subatomic dimension (see Figure 4.1).

Visible light is nestled in-between the infrared and ultraviolet range (see Figure 4.2). The progression from longest to shortest wavelength is from red (following infrared) to violet (preceding ultraviolet) in the 700 to 380 nanometre (millionths of a metre) wavelength distribution.

Figure 4.1 The Electromagnetic Spectrum

Figure 4.2 Visible Spectrum

We describe the **temperature** (relative warmth to coolness) of light in degrees Kelvin. Typical daylight ranges from 5000 to 6500 degrees Kelvin. We use the labels D50 and D65 to indicate daylight-viewing conditions at these temperature points.

Observer

The greatest complexity of the colour event occurs in the interaction with the observer. The science of physiology, the study of the human body's functions, provides half the story. Psychology, which provides insights about the function of the mind, completes the tale.

We begin with how our eyes, our optic systems, respond to light. Trichromacy and opponency are the key concepts.

Trichromacy

Figure 4.3 Rods and cones (adapted by Ken Jeffery)

We call it ‘visible’ light because it is the portion of the electromagnetic spectrum that our eyes are sensitive to. The two types of receptors in our eyes are cones and rods (see Figure 4.3). The cones respond to colour and the rods come into play in low-light situations when we see only varying shades of grey. There are three types of cones, each sensitive to approximately one-third of the visible spectrum. We characterize those segments of the spectrum as red, green, and blue, and this three-colour or trichromatic response by the cones is where all colour experience begins. Every colour we perceive comes from mixing varying volumes of the red, green, and blue signals from the three types of cones in our eyes.

The Additive Primaries

We refer to the *red*, *green*, and *blue* colour set (**RGB**) as the **additive primaries**. When we combine or add all three of these, we get the entire spectrum and, thus, white light. This is the primary colour set involved whenever we talk about the transmission of light, such as the display on a computer monitor, a tablet, or from a projector. For this reason, red, green, and blue are also referred to as the **transmissive primaries**.

The Subtractive Primaries

What happens when we project two of the three additive primaries on top of each other? This is the same as removing or subtracting one of the additive primaries from white light. Let’s start with red and green. Though not at all intuitive, if you have any experience with mixing paint or inks, the combination of red and green light produces yellow. Remember that we are adding light to light, so the production of a

brighter colour is to be expected. Continuing on: combining green and blue gives us a light blue that we call cyan, while the combination of red and blue produces magenta.

Since each of these colours is produced by subtracting one of the additive primaries from the full complement of white light, we refer to this colour set of *cyan*, *magenta*, and *yellow* (**CMY**) as the **subtractive primaries**. Each of the subtractive primaries acts as a filter for its complementary colour in the additive primary colour set. Cyan absorbs all red light, reflecting only green and blue. Magenta absorbs all green light, returning only red and blue; while yellow absorbs all blue light and reflects back only red and green. What colour would you see if you shone green light on a magenta patch?

Just as we can produce any colour sensation in the transmission of light by mixing the appropriate quantities of red, green, and blue, we can produce the corresponding colour sensation when we put ink on paper by absorbing the necessary portions of the visible spectrum so that only the required amounts of red, green, and blue are reflected back. This is how cyan, magenta, and yellow work as our primary colours in the printing environment, and why we also call them the **reflective primaries**.

Opponency

The second half of the role that our human physiology plays in the observer's part of the colour event is the concept of opponency. Our eyes' tristimulus response (a response to the red, green, and blue portions of incoming light) is the input, but the interpretation occurs when we map that input to a location in a colour space determined by three axes of opposing sensations. We have a built-in colour map where we define our colour perception by identifying the perceived colour based on its degree of greenness to redness, blueness to yellowness, and darkness to lightness.

These three pairs of opposites — green-red, blue-yellow, dark-light — are the fundamental guide posts we use to position any colour we perceive on our internal colour map. These opponent colour pairs are exclusive colour entities, occupying opposing ends of the range of our interpretation. Unlike a yellowish-orange or a reddish-purple, we cannot imagine a colour having the properties of red and green or blue and yellow at the same time.

Lab Colour Space

Once the opponent nature of colour interpretation was understood, colour scientists were able to create a model colour space based on the opposing pairs. This is the **Lab colour space** (see Figure 4.4). The Lab variation of interest to us is officially called *CIELAB*, and all references in this textbook to *Lab* will mean *CIELAB*. Additionally, references to *L*, *a*, and *b* in this textbook are equivalent to the L^* , a^* , and b^* units of the CIELAB colour space. Each of the opposing pairs provides one axis of this three-dimensional colour space. *L* is the axis for darkness to lightness; *a* is the axis for greenness to redness; and *b* is the axis for blueness to yellowness. By providing a value for each of the *L*, *a*, and *b* attributes, a colour is accurately and uniquely located in the colour space. The tremendous utility of the Lab colour space is that it allows for the mathematical description of a colour in a non-ambiguous and meaningful way.

Psychology of Colour Perception

We come to the last of our three science P's: psychology. After the trichromatic response is passed to opponent interpretation in the physiology of our optic systems, the final engagement of colour perception occurs in our minds. This interaction complicates and potentially confounds our objective measurements, so it is critical to be aware of the typical issues that the filter of our mind brings to the arena of colour perception.

Colour Constancy

Colour constancy is how our mind adjusts our colour perception to discount or remove the effects of an overall colour cast due to a coloured illuminant. If we see someone wearing a yellow sweater illuminated by a bluish cast of light, we still 'see' a yellow sweater, even though we have no trouble identifying the colour in the sweater as green if it is isolated from the scene. In our mind, we remove the blue

constituents of all colours in the scene that we assume are coming from the tint in the light source. This behaviour is also known as **chromatic adaptation**.

The effect of **adjacency** is very similar to colour constancy. A colour placed next to a light colour appears darker than when that same colour is placed next to a dark colour (see examples in Figures 4.5 and 4.6). We make adjustments to our interpretation based on our assessment of the environment.

Figure 4.5 Both greens are the same colour

Figure 4.6 Both reds are the same colour

The effect of colour constancy provides a very important lesson in judging our success in colour matching: it is more important to preserve the overall colour relationships in our image than to focus on individual colour accuracy.

Memory Colours

In our mind's eye, not all colours are created equal. Due to their historical importance to our survival, we pay special attention to certain colours. Flesh tones, the blue of the sky, and the greens of grass are known as memory colours due to the additional weight they have in our hierarchy of colour.

We need to give these memory colours a priority when we evaluate our colour management efforts. If these key colours aren't right, then everything will look wrong.

The significant impact of our mind's contribution to colour perception enforces the requirement to take colour matching beyond the raw numbers we can extract from the physics and physiology of light's interaction with an object and our optic systems. The psychological components such as colour constancy and memory colours can only be accommodated by human intervention in a colour management system.

4.3 Measuring Devices

Alan Martin

We measure light to provide the data needed to manage colour in a graphic production environment. There are three ways to measure light and three corresponding tools available to take those measurements: densitometer, colorimeter, and spectrophotometer.

Densitometre

To measure only the volume of light, we use a densitometer. The **densitometre** provides a known volume of light and then records what remainder of that light is returned to the device. A transmissive densitometer records how much light gets through a semi-transparent material such as camera film, and a reflective densitometer measures how much light has bounced back. The majority of densitometers in the print environment are reflective.

How does measuring the volume of light help us? Maintaining a consistent thickness of ink in printing is a very good way to control consistency and quality, and measuring the amount of light absorbed by the ink is a very accurate indicator of ink thickness.

Since our eyes have to function over a very wide range of brightness, we have a non-linear response to increasing volumes of light. That means it takes approximately 10 times the amount of light for us to experience one step in our perception of brightness. To match this behaviour of our eyes, the density scale is based on powers of 10, with each larger whole number representing one-tenth the volume of light of the preceding number. A density reading of 1.0 means that 1/10 of the original light has been reflected back. This is a typical reading for a process Yellow patch in offset lithographic printing. A density reading of 2.0 indicates that 1/100 of the original light is returned, while a density reading of 3.0 shows only 1/1000 coming back. Black ink is usually in the 1.7 density range, with cyan and magenta at 1.3 to 1.4.

Scanning or hand-held densitometers are typically found in the viewing station by a press. Densities are recorded when the printed sample matches the desired result and then ongoing adjustments to maintain the target densities keep the printing on target.

Colorimetre

Colorimetres mimic the three-colour response of our eyes by using red, green, and blue filters to measure the amount of light present in each third of the spectrum. They have built-in software to calculate Lab values based on what volume of red, green, and blue is returned from a sample. Colorimeters are particularly useful for calibrating and profiling monitors. Some well-known examples of colorimeters are the X-Rite ColorMunki or i1 Display devices.

Spectrophotometre

Spectrophotometres measure slices of the spectrum to produce a spectral ‘map’ of the light reflected back from a sample. Spectrophotometers are typically more expensive than densitometers and colorimeters but are employed because they can more accurately do the jobs of both devices. They work by recording the light at specific wavelengths over the wavelength range of visible light, and then by converting this spectral data to colorimetric and densitometric values.

While we are talking about measuring spectral values, it is important to note that we do not depend on identical spectral values to achieve matching colour experiences. Different spectral values can trigger the same volume of colour signals in our optic system and lead to matching colour perception. In fact, we depend on this phenomenon in graphic production in order for proofing devices to simulate the colour output of a printing press or for any two devices to be colour aligned. The ability of the CMYK (cyan, magenta, yellow, black) process colour set to mimic most of the colours in the world is also based on the fact that we can achieve a colorimetric match without having identical spectral values.

4.4 Lab Colour Space and Delta E Measurements

Alan Martin

The CIE (Commission Internationale d'Eclairage or International Commission on Light) is a scientific body formed by colour scientists in the 1930s that has provided much of the fundamental colour knowledge we possess today. Three core definitions provided by the CIE are the standard observer, the Lab colour space, and Delta E measurements. The latter two are particularly important for colour management.

The Lab Colour Space Revisited

In section, 4.2, we mentioned the Lab colour space as a natural outgrowth of understanding the function of opponency in human vision. It's comprised of three axes: *L* represents darkness to lightness, with values ranging from 0 to 100; *a* represents greenness to redness with values of -128 to +127; and *b* represents blueness to yellowness also with values from -128 to +127.

Notice that there are no negative values on the *L* axis as we can't have less than zero light, which describes absolute darkness. The *L* axis is considered **achromatic** meaning without colour. Here we are dealing with the volume rather than the kind of light. In contrast, the *a* and *b* axes are **chromatic**, describing the colour character and the type of light.

The standard two-dimensional depiction is of only the *a* and *b* axes, with *a* as the horizontal axis and *b* as the vertical axis. This places *red* to the right, green to the left, *blue* at the bottom, and *yellow* at the top. If you found our previous mnemonic aid of POLO helpful, you can use RGBY to remember the colour pairs. For correct placement, remember that *red* is on the *right*, and *blue* is on the *bottom*.

Colours are more neutral and grey toward the centre of the colour space, along the *L* axis. Imagine that equivalent values of the opposing colours are cancelling each other out, reducing the saturation and intensity of those colours. The most saturated colours are at the extremes of the *a* and *b* axes, in both the large positive and negative numbers. For a visual depiction of the Lab colour space, open the ColorSync application found in the Utilities folder of any Macintosh computer and view one of the default profiles such as Adobe RGB.

Now it's time to explore the practical application of this colour map for the comparative analysis of colour samples. We can't make any progress in evaluating our success in colour matching unless we have a frame of reference, some yardstick to determine how much one colour sample is similar or different from another. That yardstick is the Delta E measurement.

Delta E

Colour Differences: ΔE_{Lab} 

Figure 4.7 Lab Colour Space

Delta, the fourth letter of the Greek alphabet and symbolized as a triangle, is used in science to indicate difference. **Delta E** is the difference between two colours designated as two points in the Lab colour space. With values assigned to each of the L, a, and b attributes of two colours, we can use simple geometry to calculate the distance between their two placements in the Lab colour space (see Figure 4.7).

How do we do that? It looks a lot like the formula used to determine the long side of a right triangle that you may remember from high school geometry. We square the difference between each of the L, a, and b values; add them all together; and take the square root of that sum. Written out as a formula it looks a little more daunting: $\sqrt{(L_1 - L_2)^2 + (a_1 - a_2)^2 + (b_1 - b_2)^2}$.

Let's try a simple example to see what we get. Colour 1 has a Lab value of 51, 2, 2 and Colour 2 is 50, 0, 0 (right at the centre of the colour space):

$$L_1 - L_2 = 51 - 50 = 1, \text{ and } 1 \times 1 = 1, \text{ so our first value is 1.}$$

$$a_1 - a_2 = 2 - 0 = 2; \text{ and } 2 \times 2 = 4, \text{ so our second value is 4.}$$

$$b_1 - b_2 = 2 - 0 = 2; 2 \times 2 = 4, \text{ so the third value is also 4.}$$

$$\text{Add them together: } 1 + 4 + 4 = 9; \text{ and take the square root: } \sqrt{9} = 3.$$

The Delta E (difference) between our two colours is 3. Could we detect that difference if we were viewing those two colours? Probably just barely. The minimum Delta E for seeing a difference is about 2. Smaller differences can normally be detected in neutral colours (such as our samples), while more saturated colours require a slightly larger Delta E. A Delta E of 4 is the upper threshold for acceptable machine repeatability or consistency.

Delta E provides a value indicating the overall difference between two colours. It does not provide any colour-related data such as which colour is lighter/darker, redder/greener, more blue/more yellow. To understand how the colours are different, we have to evaluate the comparative L, a, and b differences independently.

Experimentation over time has come to show that conventional Delta E is about 75% accurate in showing the difference we see between two colours. Delta E numbers exaggerate the differences in yellows and compress our perceptual distance between blues. To improve on the representation of our interpretation of colour difference, scientists have produced a modified formula known as Delta E(94).

Delta E(94)

Delta E(94) is a modified formula that provides about 95% accuracy in correlation to human perception of colour differences. Here it is in all its splendour:

$$\delta E_{94}^* = \sqrt{\left(\frac{\delta L^*}{k_L S_L}\right)^2 + \left(\frac{\delta C_{ab}^*}{k_C S_C}\right)^2 + \left(\frac{\delta H_{ab}^*}{k_H S_H}\right)^2}$$

where:

$$S_L = 1$$

$$S_C = 1 + 0.045 C_{ab}$$

$$S_H = 1 + 0.015 C_{ab}$$

$$K_L = K_C = K_H = 1 \text{ (for reference conditions)}$$

$$C_{ab} = C_{ab}^* \text{ (standard) OR } \sqrt{C_{ab,1} C_{ab,2}}$$

$$\delta H_{ab}^* = \sqrt{\delta E_{ab}^{*2} - \delta L^{*2} - \delta C_{ab}^{*2}}$$

You can see that it is still the comparison of three values: L, C, and H, where C and H are produced by applying modifying factors to the original Lab values to compensate for perceptual distortions in the colour space. Each difference is squared and the root taken of the sum of the squares, just as in the original Delta E formula.

There is an additional refinement in Delta E(2000) where further adjustments are applied to blue and neutral colours and compensations for lightness, chroma, and hue. This is a much smaller correction than the change from Delta E to Delta E(94).

The good news is that you don't need to understand or remember any of the details of these equations. Just remember that these are real numbers measuring actual plotted distances between colour samples. Delta E represents the distance between two points in the Lab colour space. Delta E(94) and Delta E(2000) are enhancements, providing improved numbers that more closely match our perception of colour differences.

4.5 Working with a Spectrophotometer to Read Standard Colour Charts for Output Profiling

Alan Martin

Armed with our fundamental concepts in colour theory, we can apply these principles to the physical process of colour management. The practical application to print production requires a procedure for measurement, colour profile generation, and the correct use of profiles in the manufacturing process. Let's begin with measurement and discuss the working components of a standard graphic arts spectrophotometer and the colour charts we would use it with.

X-Rite i-One (i1) Pro Spectrophotometer

The i1 Pro is one of the most common hand-held spectrophotometers used in the graphic reproduction industry. It can also be mounted in the iO base for automated scanning. As described in section 4.3, the **spectro** works by recording spectral data from incremental slices of the range of wavelengths included in visible light. To do this properly, the spectro must calibrate its white point to establish the baseline for interpretation. It does this by reading the white tile supplied in the baseplate that comes with the spectro. Each baseplate is uniquely matched to a specific spectrophotometer and marked with a serial number that corresponds to its spectro. Make sure you confirm that you have the correct baseplate that matches the serial number on your spectro. When used commercially, the manufacturer recommends that a spectro be returned for factory recalibration every two years. The packaging will include a certificate indicating the expiry date for the current calibration.

The spectro may also be identified (on both the serial number tag and surrounding the light-emitting aperture) as a UV-cut. This indicates it has an ultraviolet filter, which acts to remove the impact of fluorescence from optical paper brighteners. If you have access to more than one spectro device, be sure that any related measurements are done consistently either with or without the filter. Best practice is to use exactly the same instrument for any series of measurements.

The USB cable provides power to the spectro and so should be plugged directly into the computer and not into a peripheral such as a keyboard. Additional typical accessories for the spectro include a weighted strap and screw-in base for hanging the spectro against the screen of a monitor and a proof mount base with sliding rail for the spectro to read printed colour targets.

Colour Charts or Targets

You will typically be dependent on the colour management software application that you have chosen to produce a pdf file of the colour chart that your spectro can read. While in the software, you select a reading device (such as the X-Rite i1 Pro or i1 iO) from the list of devices that the software supports and then provide the dimensions for your output device. The choice of reading device will determine the

size of colour patches and page format, and the size of output will define how many pages are ganged to a sheet. When prompted, name the pdf with a clear identifier (output device and date or equivalent) and save it.

Once you have the pdf, use it for any direct output, such as a proofer, or to make a plate for your printing press so that the colour chart can be printed. In all cases, it is critical that no colour management be applied to the output device for the production of the chart so that the natural base state of the device is captured in the colour target produced. It is also essential that the proofer or press be in an optimal operating state so that the output is an accurate reflection of the device's capabilities. This may require a calibration process for a proofer or standard maintenance procedure on the press.

There are several colour chart standards that you should be aware of. The chart produced by your colour management software will likely be one of these or a slight variation thereof. The original standard is the IT8.7/3, composed of 928 colour patches. This was followed by the ECI 2002, which has 1,485 colour samples. There is now an update to the IT8, the IT8.7/4, which has extended the colour sampling to 1,617 patches. The larger number of patches provides a more detailed snapshot of the colour capability of the device that you are profiling. Of course, it takes more time to read the greater number of samples, so the newer sets are more manageable with automated reading devices such as the iO table. If you are reading with a hand-held spectro, choose the IT8.7/3 or smaller patch set if it is offered by your colour management software. The other trade-off between larger and smaller numbers of colour patches lies in the smoothness of colour transitions. Fewer data points mean less interpolation and potentially smoother curves in colour modulation. Be aware that it will require some experimentation on a device-by-device basis to determine the ideal intersection of accuracy and smooth interpretation for your measurement data.

The colour charts come in two standard patterns of organization: random and visual. Random is exactly that, and comprises the vast majority of charts that are produced for measuring. The colour swatches are distributed to provide optimal contrast between adjacent patches to aid the spectrophotometer that is reading them in distinguishing where one patch ends and the next begins. Having the colours scattered over the sheet also generates relatively even distribution of cyan, magenta, yellow, and black ink which leads to better performance from the press. The visual pattern places the colour blocks in a logical and progressive sequence so it's easy to see the chromatic ranges that are covered. Some scanning spectrophotometers can read the visual arrangement.

Measuring Your Colour Chart

Once you have used the pdf to generate the printed sample, you have to measure the sample. For charts from proofers, it is critical to wait a minimum of 30 to 90 minutes after the sample has been produced before measuring in order for the colour to stabilize. To create a measurement file, you need three things: colour management software; a target from that software; and a measuring instrument supported by the software. After connecting your measuring device to the computer (remember to connect directly to a USB port on the computer, not to a peripheral such as a keyboard), enter the measuring step of your colour management software. You will need to point to the correct measurement chart that was used, which can be easily identified if you have named it distinctively, and confirm the right measuring device is indicated. If you are getting errors once you begin measuring and can't proceed, the typical culprit is the selection of an incorrect colour chart or incorrect measuring device.

When you begin the measurement process, there are a few option prompts you may have to respond to. Some software allows for the averaging of multiple press sheets to produce an improved characterization of the device. This software can scan the colour bars placed at the bottom of the sheet and indicate which sheets are the best candidates for measuring. If you have chosen to do multiple sheets, then you will have to record the sheet number on each of the pages that you cut from the full press sheet in order to enter the sheet number correctly as you carry on measuring.

Proofing devices are stable enough that it is not necessary to average multiple sheets. You may still be cutting out single pages from a larger sheet (depending on the size of your proofing device) and should label the individual pages to stay organized. You can skip any of the prompts that deal with choosing multi-sheet options.

Once past the initial options, you will be prompted to calibrate the measuring instrument. Make sure the i1 Pro is correctly seated on its base plate and push the button. After successful calibration, you will be instructed to mount page 1 of your colour chart and begin measuring. For hand-held measuring with the i1 Pro, use the white plastic proof mounting base it came with. Secure your page under the spring clip at the top of the mounting base, positioning it so that the sliding clear plastic guide the spectro rides on can reach the first row of colour patches. The clear plastic guide has a horizontal opening that the head of the spectro nestles into to traverse the horizontal row of colour swatches. There is a cradle for the base of the spectro to rest on that slides horizontally across the guide. The spectro must begin on white paper to the left of the colour patch row, and finish on white paper to the right of the row. If your target has a semi-circle printed to the left of its colour rows, use it to position the chart under the scanning opening of the plastic guide. The left semi-circle on the opening in the guide should align with the printed semi-circle on the chart. If there is no printed semi-circle on the chart, allow $\frac{1}{4}$ – $\frac{1}{2}$ inch of white space showing in the opening to the left of the first colour patch.

With your chart properly placed in the mounting base, position the spectro all the way to the left on the plastic guide with its base in the sliding cradle and reading aperture in the cut-away channel. Press the button on the left side of the spectro and keep it pressed. Wait one second while the white of the paper is read (there may be a beep to indicate this is done), slide the spectro smoothly and evenly to the right until you reach white paper past the colour patches, and then release the button. You should be rewarded with a prompt to scan row B. Slide the entire plastic guide down one row, move the spectro all the way back to the left, and do it all over again! If you receive an error, clear the prompt and try scanning the same row again. Success at hand-held scanning comes with a little bit of practice and a Zen approach. Your degree of success will be inversely proportional to the amount of anxiety you feel. The techniques that contribute to getting it right are smooth and even passage of the spectro; consistent pressure (make sure you are not pushing down on the head); white paper at either end; and keeping the button pressed from start to finish.

After you receive a couple of errors on the same row, the software may switch to individual patch reading. In this case, the prompt will now say “Scan patch B1” instead of the previous “Scan row B.” You must position the read head over each individual patch and press the spectro’s button when prompted on screen. After completing one row of individual patches, you will be returned to full row scanning mode. This procedure allows the measurement process to go forward when the software is having trouble detecting colour boundaries in a particular row.

Having completed all rows on all pages (which may take some time), you will be prompted to save the

measurement file. Some colour management software will take you directly to the additional settings required to define a profile and then proceed with the profile creation.

4.6 The Measurement File's Role in Colour Profiling

Alan Martin

It's important to remember that the measurement file is not a profile! It provides the basic information about the colour behaviour of the device but needs some critical additional instructions and the processing of the colour management software in order to produce a colour profile that can be used for colour transformations. The measurement file is a snapshot in time of device behaviour and depends on the appropriate calibration of the device prior to the chart's creation for its accuracy.

Figure 4.8 Example of measurement file

We can open the measurement file in a text editor and examine its structure to understand what information it contains (see Figure 4.8). The first section is header info and provides some basic

information about the file. This is followed by a key to the colour data that follows. The actual colour information comprises a row and column ID to identify the specific colour patch and then the numerical data that goes with the patch.

The key information is contained in the second section where the data format is laid out. This indicates what colour spaces are captured in the data for each colour patch. The first four values are CMYK; the next three are **XYZ** (a device independent colour space like Lab); the next three are Lab; then RGB; and finally there is a wavelength measurement for each of the 10 nanometer slices of the visible spectrum (380-730 nanometers; violet to red).

The CMYK values for each patch are fixed in the software, coming from either the IT8 or ECI specification. These CMYK values have to remain constant because they are our point of reference for all devices. When we read the patch with the spectro, it uses the spectral information (each of the 10 nanometer slices) to calculate the XYZ and Lab values that describe the colour appearance of the colour swatch. By matching the measured Lab value to the predetermined CMYK value supplied in the original pdf, we have the raw material to build a translation table describing the device's colour behaviour. Once we have this look up table (LUT), we can predict the Lab equivalent for any CMYK value produced on the device. Correspondingly, when we are given the Lab values from another device that we want to match, we can produce the appropriate CMYK values to provide that colour appearance.

Device Dependent Versus Device Independent Colour Spaces

We've defined CMYK, RGB, and Lab colour spaces, and we've seen how the first step in colour profiling is to measure output from a device to define a relationship between the CMYK device dependent and the Lab device independent numbers. Establishing this relationship between device dependent (RGB or CMYK) values and device independent (Lab) values is a fundamental component of the colour management process.

We call the CMYK and RGB colour spaces **device dependent** because the results we get from specific RGB or CMYK values depend entirely on the device producing them. When we tell a device to produce "50% cyan," we are saying, "Give me half of as much cyan as you can produce." Since the capacity and colour appearance of cyan from any two devices will not be the same, it should not be surprising that a specification of "half that much" will also produce colour events that do not match. Similarly, the RGB values on a monitor or projector simply specify some proportion of the full red, green, and blue signals that the device can produce. Since there is no common starting point between two monitors in terms of what a full red, green, or blue signal is, then providing the same RGB values to those two monitors will in no way provide an opportunity to generate the same colour appearance.

For RGB devices, RGB values simply identify the volume of signal for each channel. For printers, proofers, and presses the CMYK percentages dictate what proportion of pigments are deposited. The numbers associated with specific RGB and CMYK colours only have colour meaning when attached to a particular device. There is no inherent consistency between any two devices based on providing the same RGB or CMYK values.

So if the device dependent colour spaces don't give us any consistency or control of colour between devices, where can we turn? Enter the **device independent** colour spaces of Lab and XYZ. We

spoke of Lab earlier as the three-dimensional model colour science has produced to map the way we perceive colour. The Lab colour space is device independent because we do not depend on the values associated with the output of a specific device to enumerate the colour. Lab values are calculated from spectral readings in a controlled environment so that they define a consistent colour experience for any circumstance and from any device. Device independent colour is the Rosetta stone of colour management that allows us to translate from the unique dialect of colour behaviour on one device into a universal language and then back to the specific colour dialect of a different device and maintain the colour meaning.

The device independent colour spaces are known as profile connection spaces (PCS) since they provide this gateway service between the device dependent colour spaces of individual devices. Lab and XYZ are the two PCS allowed in the **ICC** specification that defines profile creation. From the examination of the measurement file, we can see how it provides the first step in establishing and tabulating a relationship between the device dependent values of a particular device's output and the corresponding device independent values that characterize the actual colour appearance associated with the output.

We've talked about the measurement file as the gateway to our profile creation, so let's see what steps remain to get us there.

4.7 Profile Creation

Alan Martin

What is a profile?

Figure 4.9 what is a profile

The measurement file contains the raw data of the relationship between the device dependent colour space of the device and the device independent colour space of the profile connection spaces (PCS). There are two additional parameters we have to provide along with this data in order for the colour management software to produce an output profile: total ink limit and black generation (see Figure 4.9).

Total Ink Limit

Total ink limit is a percentage, usually between 240% and 400%, that represents the upper threshold that the sum of the four process inks can total. Why would this change? Each device, in combination with its particular substrates (papers) and ink sets, has a different capability in terms of how much ink can be deposited. A coldset web newspaper press might be close to the lower end of 240%, while a high-end inkjet can support 100% from each of cyan, magenta, yellow, and black, and have a 400% rating. This total ink limit setting affects the colour distribution in darker colours. As the total ink limit decreases, dark colours require a higher proportion of black ink relative to CMY to stay within the ink limit percentage. With an ink limit of 360%, when black is at 90%, we still have room left for 90% of cyan, magenta, and yellow ($4 \times 90 = 360$). But if the ink limit is 240%, with black at 90%, we can't exceed 150% for the sum of the other three ($150 + 90 = 240$). Since cyan leads in a grey balance mix, we might have 60% cyan, 45% magenta, and 45% yellow ($60 + 45 + 45 = 150$). As the ink limit drops, black has to do more of the work of providing darkness for any heavy colour mix.

Black Generation

We also have to provide instruction on how the black component of the CMYK mix will be created. Remember that our subtractive primaries are CMY and that, theoretically, they provide all the colours in the visible spectrum. Where does K (black) come in? To bridge the gap between theory and real world performance, black ink does some very important things:

- It compensates for the spectral shortcomings of CMY inks: our inks are not perfect representations of what cyan, magenta, and yellow colours should be.
- It eliminates registration problems in black type: if there were no discreet black ink, every time we wanted to print black type we would have to stack cyan, magenta, and yellow on top of one another and make sure they fit perfectly.
- It helps us achieve easier neutrals: we can use black to replace the grey component of colours reducing the amount of CMY required to stay in balance on the press to provide consistent neutral tones.
- It provides cost savings: black ink is cheaper than coloured ink.
- It increases contrast: black's greater density extends the tonal range of CMYK printing and improves the appearance of the final printed piece.

Since black is an add-on to our primary CMY colour set, we must provide instructions for its creation. Typically, we specify the black start point, maximum black, and black strength.

- **Black start point:** The point at which black enters colour mixes (range of 0% to 50%). If the black start point is 20%, then tones from white to 20% will carry CMY only.
- **Maximum black:** The upper allowable percentage of black ink used in the K separation (range 70% to 100%).
- **Black strength:** The relative quantity of black versus cyan, magenta, and yellow in the neutral grey component of colours (range 5 to 75%). As the number increases, colours can contain more black.

Black strength settings are also referred to as grey component replacement (GCR) values in colour separations. These may be set as percentages or simply as light, medium, and heavy, where more equals a larger proportion of black taking the place of CMY in neutral tones. GCR is the successor to UCR (under colour removal), which only moved exactly equivalent amounts of CMY to the black channel. UCR separations exhibit a 'skeletal' black, where there is a small amount of content in the black separation. With GCR, and as the black strength increases, more and more content moves into the black channel.

Final Processing

With the measurement file available, and total ink limit and black generation specified, processing can start in the colour management software and an output profile created. It will take from two to five minutes for all the calculations to complete. You may be prompted to specify whether to save the profile in the system or user location, or both. The system location will make the profile available to

all users of the computer, while the user location will restrict it to the current user. Depending on your permissions at the computer, you may not be able to write into the system location. On an Apple OS X machine, the default location for the system is `System/Library/ColorSync/Profiles` and for the user, `Users/(userID)/Library/ColorSync/Profiles`.

Viewing Your Profile

The Mac provides a built-in tool for viewing a profile or comparing two profiles. From the Utilities folder, launch ColorSync. Select the second tab from the left and you'll see a selection window on the left and a display pane on the right. The selection window contains a list of all ColorSync aware locations on your computer. Tip open the available folders and browse to find the profile you wish to view. Select a profile and a three-dimensional representation of its **gamut** in the Lab colour space appears on the right. Use your cursor to rotate the profile through all three of its axes. From the drop-down triangle in the display pane, choose Hold for comparison. The current profile is ghosted back, and you can select a second profile to display at full strength on top of it so you can compare the relative gamuts of the two profiles.

Profile Limitations

Remember that your profile represents the behaviour of the device for particular imaging parameters such as a specific substrate, resolution (screen ruling), and ink set. If any of those parameters are significantly altered, it requires a new profile to accurately represent the colour results. For real-world applications, profiles representing related groups of parameters are employed. One profile might represent all uncoated stock at 100 to 133 lines per inch, a second for coated stock at 150 to 175 lines per inch, and a third for a high saturation ink set on glossy stock with high resolution stochastic screening.

4.8 Beyond Output Profiling: Display, Input, and Device Link Profiles

Alan Martin

Up to this point, we have focused exclusively on the output profile in our discussion of profiling. This makes sense, since this is the predominant profile we are concerned with in graphic production. Output profiles characterize output devices such as printers, proofers, and presses, but there are other devices that we have to manage in the full spectrum of a colour-managed workflow, and these require two additional classes of **ICC profiles**: display and input.

Display profiles capture the colour characteristics of monitors, projectors, and other display devices. Input profiles characterize devices that capture images such as scanners and digital cameras.

Display Profiling

You may hear this class of profile referred to as *monitor profiling*, but the more accurate designation is *display profiling* to acknowledge the inclusion of components beyond the monitor such as the video card and video drivers. Though less commonly profiled, this class of profile encompasses digital projectors as well.

In preparation for display profiling, the cardinal rule of thumb is to make whatever adjustments we can in the actual monitor. Any software adjustments to the VideoLUT (the look up table stored on the video card) reduce the operating range of the monitor and limit the spectrum of the display. With the predominance of LCD monitors, this means that the brightness or white luminance is the only hardware adjustment available. If you see reference to black level or colour temperature settings, this harkens back to CRT monitors where these were actual hardware settings. For LCD monitors, these are software controls. For an LCD, all light comes from the backlight, which is a fluorescent array behind a diffuser, so the only monitor control is the brightness of this backlight.

Display profile software typically combines calibration and profiling. A setting called the vcgt (video card gamma type) tag in the display profile can download settings to the VideoLUT on the video card and change monitor behaviour. This is an unusual deviation from the standard protocol in colour management where the profile never alters the behaviour of the device. Calibration is used to optimize device function and characterization or profiling captures a description of device behaviour. Normally, the application of a profile should not have any influence on the device function.

Before calibration, it's essential to warm up an LCD monitor for 30 to 90 minutes. Check the full brightness. If the monitor has aged to the point where it can't achieve adequate brightness, then it should be abandoned as a candidate for profiling. Set the standard refresh rate and resolution that will be used on the monitor. If these are changed after profiling, then the profile cannot be considered accurate. Clean the screen with an appropriate gentle cleaner.

When you begin the profiling software, you will be prompted to identify your instrument. Colorimeters are often provided in display profiling packages, but most software works with standard

spectrophotometers (spectros), such as the i1 Pro.

The recommended settings to enter for the set-up phase are:

- White point: D65 (6500 K)
- Gamma: 2.2

The setting 6500 K is usually close to the native white point of an LCD monitor. You can choose Native White Point if you feel that 6500 is too far from the actual white point of your monitor. Gamma is the tone reproduction curve of the monitor. The setting 2.2 typically provides the smoothest gradients in monitor display.

Next is the choice of a patch set from small, medium, and large options. This determines the number of colour swatches that will be projected on screen for the instrument to read. The trade-off is between calibration time and colour range. Start with the small patch set and see if you are happy with the results.

To start this process, make sure the i1 is on its base plate for the instrument calibration step and then suspend the spectro in the monitor mounting strap on the monitor. The weight at one end of the strap hangs behind the monitor to counterbalance the spectro, and the i1 Pro locks into the mounting plate at the other end of the strap to keep it in place on the monitor screen. The reading aperture of the spectro should be approximately in the centre of the screen. Tip the monitor back very slightly to help the spectro sit flat of the front of the LCD.

When you tell the software to proceed, it begins projecting a series of colour swatches that the colorimeter or spectro records. As you did to produce the measurement file for your output profile, you are building a comparative table of known device values (the RGB swatches projected on the screen), with device independent values (Lab readings from the spectro) that describe their appearance. This may take from three to ten minutes. During this process, make sure that no screen saver becomes active and you keep the mouse out of the scanning area and. If you leave before the process is completed, check that the spectro is properly positioned when you return.

Once the colour patches are done, you will be prompted to name and save the profile. Make a habit of naming your profile with the date so its age can be easily checked. Saving display profiles is similar to saving output profiles, where the user chooses system and user options. With display profiles, there is no value in saving previous versions. All you are interested in is the current state of the monitor.

To see the active profile on a Mac, choose System Preferences/Displays/Color. The active profile will be highlighted at the top of the list. There is a check box toggle limiting the list so only profiles that are known to be associated with the monitor show.

Input Profiles

As mentioned, we need input profiles when we capture images. There are predominantly two types of devices associated with image capture: scanners and digital cameras. The fundamental concept in producing an input profile is that RGB device values scanned or photographed from a target are matched to device independent Lab values either provided by the target vendor or measured from the target itself.

For input profile creation, the targets always consist of two parts: a physical sequence of colour patches and a target description file (TDF) with the profile connection space (PCS) values for the swatches. The TDF accuracy varies from individually measured targets (done by you or a specialty vendor) at the high end to averaged samples from a batch run (an economical alternative).

As with output profiling, there are standard scanner target formats. We have IT8.7/1 for transmissive originals (film transparencies like slides) and the IT8.7/2 for reflective (photo print paper). These targets are available from a variety of vendors and allow you to match the material of the target to the material you will be scanning. If you will be scanning Kodachrome slides, you will want a Kodachrome IT8.7.1 target. Conversely, if your originals are Fuji photo prints, then you will want an IT8.7.2 target on the matching Fuji photo print paper.

The X-Rite ColorChecker targets are commonly used for digital cameras. There is the original ColorChecker with 24 tiles and the later digital ColorChecker SG with 140 colour tiles. The larger target can be used for initial set-up and there is a mini version of the original ColorChecker that will work in most photo shoots for an ongoing reference check.

Though scanners and digital cameras both fall into our domain of input profiling, they have some very different characteristics that we have to take into account when preparing to produce a useful profile. As with output profiling, we need to calibrate the device by stabilizing and optimizing its performance prior to capturing its colour behaviour. In order to stabilize, we need to understand the potential variables that the device presents. Scanners have a controlled light source and stable filters and typically have the option for extensive software intervention. In contrast, cameras have stable filters and moderate software controls but have the potential for hugely variable lighting conditions. The excessive variability of outdoor lighting limits useful profile creation to interior and in-studio camera work. If the lighting conditions can be controlled adequately in the studio, then colour-accurate capture can take place and colour accuracy can be maintained in the production work that follows.

Stabilizing a scanner's performance comes from turning off any automatic adjustments for colour correction:

- White and black point setting
- Removing colour casts
- Sharpening

If you can't turn these off, then the scanner is likely not a good candidate for profiling. Optimize the scanner's behaviour with an output gamma setting of 2.6 to 3.0.

Stabilizing a camera's performance comes from the appropriate lighting and capture settings. Use even lighting and full highlight and shadow exposure for target capture. For colour temperature, use grey balance for camera back devices, and white balance for colour filter arrays (CFA). Optimize the camera's bit depth retention with gamma 1.0 for raw profiling.

With calibration complete, it's time to capture the target. For a scanner:

- Mount straight
- Mask open bed areas

- Scan as high-bit tiff
- Open in Photoshop (beware of any automated conversions or profile assignments) to rotate, crop, and spot

Comparatively, for the digital camera:

- Light evenly
- Capture square
- Open in Photoshop (beware of any automated conversions or profile assignments) to rotate, crop, and spot

With the digital image in hand, we're ready for the input profile creation. Measure the commercial target with the spectro if you are not using a supplied target description file. Launch your colour management software and you will be prompted to identify the target image and the corresponding target description file. The profiling software reads the RGB values from the scanned or captured image, and the software processes the target description file and RGB measurement file to produce the input profile. File-saving options are very similar to what we have previous described for output and display profiles.

Device Link Profiles

Device link profiles are most closely related to the output class of profiles. A device link profile combines two output profiles to provide the specific conversion instructions between two particular devices. It provides the opportunity to maintain black and other separation purity (i.e., what begins as black only in the source colour space emerges as black only in the destination colour space) by removing the need for passing the colour transformation through the PCS. To define a device link, we identify a source and destination profile to our colour management software, specify the rendering intent, and provide details on how constrained the re-separation should be. By avoiding the passage into and back out of the PCS, we can very strictly control the parameters of the colour conversion. The options for conversion are:

- Full re-separation — Complete re-separation. Solid colours in the original file may not remain solid. The black generation parameters that you specify are used, which may result in using less chromatic ink and more black ink.
- CMYK integrity — All colour builds can be adjusted. The relative amount of black versus CMY will be preserved in content processed through the device link.
- Black purity only — Any colours other than the black channel (solid K, K-greys) can be adjusted.
- Colour and black purity — The same as fully constrained, but solid colours can be reduced to a tint.
- Fully constrained — Any colour made with only one or two inks will not have other inks added. Solid (100% tints) primaries and secondaries are not affected and remain solid.
- Ink optimizing — A proprietary term in the ColorFlow colour management software for applying a full re-separation with a heavy grey component replacement (GCR) algorithm.

Colour management software used to be required to preview the results of applying a device link. With the last few versions of Adobe Photoshop, a device link option has been added to the advanced dialog window of the Color Conversion menu, making device link previewing much more accessible. Currently, Photoshop only supports CMYK to CMYK device links. It does not support RGB to CMYK device links. Another alternative for viewing the results of applying a device link is to generate a virtual proof (VPS) in Kodak Prinergy with the device link specified. For details, see section 4.11 in this chapter.

With this extraordinary level of control, why don't we use device links for every colour conversion? The truth is, that with our gain in managing the colour conversion process, we sacrifice an even greater degree of flexibility. The premise of colour management and the use of profiles is that we do not have to generate a unique profile for each pairing of devices. With the power of the PCS gateway to provide the device independent colour description, we only need a single profile for each colour condition of a device and any two profiles can be positioned on either side of the PCS to provide a pathway for the colour conversion.

Where it does make sense to go to the extra trouble of generating a device link profile is a situation where a specific pairing of two devices is used over and over again, such as a proofer for a particular press condition, or to keep two presses in a shop matched for their colour output.

If we process an image from RGB to CMYK at the beginning of our production process, we gain the stability of having the image in our known CMYK space, but we surrender the flexibility of converting to the optimal CMYK space at final output. For final stage or late-binding conversion, we are dependent on the RIP environment for managing the calculations between the profile pair (see [Section 5.2](#)). A device link provides additional security in the conversion process by reducing the variability that can come with the processing application input that is part of a profile pair transformation.

4.9 A Review of the Profile Classes

Alan Martin

We've now touched on the four types or classes of profiles: display, input, output, and device link. What traits do they have in common? They are:

- Specified by ICC-defined file formats
- Contain colour tables
- Have device colour values associated with device independent colour values (PCS)
- Use a measuring device (spectrophotometer) and targets for creation
- Require a specified rendering intent
- Have standard OS library locations

There are also some unique characteristics for each profile class that help define the role they play in the overall colour management process. The display class of profiles:

- Have no separate, tangible target: the device 'is' the target
- Can affect device behaviour
- Are mostly integrated with device calibration

The input class of profiles:

- Are unidirectional: A to B table only (device values to PCS)
- Are able to exclude any external measuring (with a supplied TDF)
- Ensure that the target's job is tell us how the device 'sees' the target

Output (and device link) class of profiles:

- Use CMYK (versus RGB for display and input)
- Have black handling settings
- Have the largest and most complex colour tables
- Ensure the target's job is to tell us how the device 'makes' the target
- Provides preview capability for upstream editing

We also discussed the functions of a profile in the colour equation. The two functions are source and destination. A source profile is a profile used to convert device dependent RGB or CMYK information to a device independent colour space (Lab). A destination profile is a profile used to convert information from a device independent colour space (Lab) into a device dependent colour space of an output device

(RGB or CMYK). You can think of the source profile as the colour reference or the place from which our desired colour appearance comes. The destination profile describes the location where we are producing colour in the current pairing of devices. If we want a proofer to simulate the colour behaviour of a particular press, the press's profile is the source (the desired colour behaviour) and the profile for the proofer is the destination (our colour output).

Do not confuse a profile's class with its function; they are independent and separate characteristics. A particular output profile can assume the function of source in one colour equation and then turn around and assume the role of destination in a second. Take the example of the press above, where the press profile acted as the source. If we have multiple presses in the printing plant, and we have another press that is our master press for colour behaviour, the press profile that acted as a source for the proofer output will now function as a destination profile to align that press to the colour behaviour of the master press (the master press profile is the source profile in this pairing).

Profiles enable the two key processes of any colour managed workflow: clear communication of colour meaning and the transformation of device values to maintain colour appearance.

4.10 The Components and Purpose of a Colour Management System

Alan Martin

Our primary goal in colour management is to provide a consistent perceptual experience. As we move from device to device, within the limits of the individual device's colour gamut, our interpretation of the colour event should be the same.

As we've discussed, but it's worth repeating, we achieve that goal in two fundamental steps:

1. We give colour its meaning through device independent colour values correlated to a specific device's RGB or CMYK numbers.
2. We transform our destination device's specific values to match the perceived colour definitions of our source.

The Components

We have spoken at great length about colour profiles, but there are three additional pieces required to enact a colour-managed workflow: the profile connection space (PCS), a colour management module (CMM), and rendering intents.

The PCS provides the device independent colour definitions to which device values can be matched. The ICC specification allows the XYZ or Lab colour spaces for the PCS.

Profiles provide the look up table for the conversion of device values to PCS and vice versa. Any conversion requires two profiles (or a device link into which two profiles have been merged).

The CMM is the software engine that actually does the conversion. It lives in a product like Adobe Photoshop or Kodak Prinergy, where file processing takes place. The CMM provides two major benefits: it reduces profile size by doing the interpolation in colour calculations and compensates for shortcomings in the Lab colour space. The CMM does the heavy lifting by providing the computation of the conversion. For consistency, it is best to keep to a common CMM as much as possible. The Adobe Color Engine or ACE is the CMM seen referenced in the Color Setup dialog window of the Adobe Creative products.

Rendering intents are the instructions for dealing with out-of-gamut colours (see Figure 4.10). They are user-selectable controls to define colour rendition when you move colour from one device to another. There are four types of rendering intents: perceptual, saturation, relative colorimetric, and absolute colorimetric. Each intent represents a different colour conversion compromise, resulting in a different gamut mapping style.

Rendering intents

Figure 4.10

Perceptual and saturation intents use gamut compression, where the overall gamut space is adjusted. Relative and absolute colorimetric intents use gamut clipping, where colour matching is maintained throughout the available gamut, and out-of-gamut colours are moved to the available extremes of the destination gamut.

The perceptual intent is used mainly for RGB to CMYK transformations, which are typically image conversions. Since we are moving from a larger gamut (RGB) to a smaller gamut (CMYK), it makes sense to employ a rendering intent that preserves the overall relationship rather than one that emphasizes one-to-one colour matching within the gamut.

The saturation intent is the least relevant for colour-managed workflows. When you use this intent, colour saturation is preserved as much as possible at the expense of hue and luminance. The result is a bad colour match, but the vividness of pure colours is preserved. This intent is usually used for documents such as presentations, charts, and diagrams, but not for graphic arts jobs.

The two colorimetric intents, relative and absolute, are closely related. They are both used for CMYK to CMYK conversions where the gamuts of source and destination are closely matched or the destination is larger (typical of a proofer compared to the press it is matching). They emphasize exact colour matching for in-gamut colours and clip out-of-gamut colours.

The only difference between the two colorimetric rendering intents is in white point handling. The absolute intent pays attention to the colour of white in the source and reproduces that in the destination. Think of newspaper printing where the whitest colour is the paper that has a dull and beige tone. With an absolute rendering intent, a proofer matching the newspaper would add that beige colour to all of the white areas of the proof. This matching of white destination to white source colour is not usually necessary due to the chromatic adaptation or colour constancy that we discussed earlier. We have a built-in mechanism for adjusting to judge the overall colour relationship independent of the appearance of white. For this reason, the relative colorimetric intent is used most of the time and the white of the destination is not adjusted to simulate the white point of the source.

With all of the pieces of the colour management process clearly delineated, we can put them to use in our standard graphic arts workflow applications.

4.11 Applying Colour Management in the Adobe Creative and Kodak Prinergy Software

Alan Martin

Colour management comes into play at two primary points in the print production workflow: during file creation with authoring tools like the Adobe Creative applications (Photoshop, InDesign, Illustrator), and then when the file is processed for output with a workflow software program such as Kodak Prinergy. Let's examine the details in these most widely used software tools to provide concrete examples.

Colour Set-up in the Adobe Creative Applications

The primary tool for colour management in the Adobe products is the Color Settings dialog under the Edit menu. Fortunately, these settings can be shared across all of the Adobe applications to coordinate a consistent delivery of colour strategy. Define your settings in Photoshop, as this is the application with the largest number of options, to guarantee that all possible options have been set to your choices.

Launch Photoshop and, from the Edit menu, choose Color Settings. There are three main sections to the dialog window: Working Spaces, Color Management Policies, and Conversion Options. Change the Settings option above the Working Spaces panel to North American Prepress 2. This applies a set of defaults that are optimal for a print production workflow.

Working Spaces is Adobe's name for default profiles. These are the profiles that will be used if no other information is available. If you open a file that is *untagged* (the terminology for a document that has no profile attached to it), the profile listed for the colour space matching the file will be *assumed* and used as long as the file is open. It will not persist with the file once the file is closed. If you create a new file in the application, the profile listed will be *assigned* and the profile reference will move forward with the file.

Let's review and clarify the terminology associated with describing the status of a colour profile relative to a particular document or file. A file that has a profile is referred to as *tagged* while one without profile is *untagged*. A tagged document can have one of two relationships with its colour profile. The colour profile can be *embedded* or *assigned*. An embedded profile is actually written into the file content. This increases the file size, but guarantees that the desired profile will be available. For an assigned profile, only a reference to the profile is contained in the document. File size is reduced, but access to the profile depends on the application and environment processing the object. You can think of an *assumed* profile as a temporary assignment that will only last as long as the file is open.

For Working Spaces options, the RGB default of Adobe RGB (1998) that comes with the North American Prepress 2 setting is a perceptually even RGB space, which makes it better for editing and a good choice. The CMYK field is where you should choose a profile specific to the final output device if it is known. The SWOP profile is a reasonable fallback and is commonly used as the industry standard

for generic work. Be aware that choosing SWOP will constrain the gamut to the capability of a web offset print condition.

The list of profiles available for selection comes from the various ColorSync aware folders that we have previously discussed. Priority is given to profiles in the Library/Application Support/Adobe/Color/Profiles/Recommended folder, and these profiles are listed first. If you have a profile that you wish to give prominence to for selection, place it in this folder.

The Color Management Policies subsection controls behaviour when opening or creating documents and when moving objects between documents. There are three options for each of the available colour space settings: Off, Preserve Embedded, or Convert to Working.

The choice of Off is the most misleading, because we can't actually turn colour management off: there is always an assumed profile if no other information is presented. With Off, copy and paste of an object moves tint values: a 50% cyan value from the originating document lands as 50% cyan in the destination document.

Preserve Embedded does what it says and maintains what's in place. New documents use the Working Space profile and become tagged. An untagged file assumes the working space profile but stays untagged. If you copy and paste native RGB objects, they are converted. If you copy and paste native CMYK objects, the tint values are maintained.

Our final choice for colour management policy is potentially the most dangerous. Convert to Working converts tagged documents using the existing profile as a source profile and the Working Space profile as the destination. If you do not have the Alert check boxes ticked, this can happen without your awareness. For an untagged document, it assumes the Working Space profile. Copy and pasting RGB or CMYK objects always converts to preserve appearance (changes the tint values).

After reviewing the choices, the recommendation for Color Management Policies is Preserve Embedded, and make sure all Alert boxes are checked. This allows you to confirm that any action is what you actually want before proceeding.

The last section of the Color Settings dialog window is the Conversion Options. The Engine option refers to the colour management module (CMM) that will be used for calculations in the colour conversions. The default choice of the Adobe Color Engine is good for maintaining consistency. Here we have as well the Rendering Intent entry, which will function as a default unless an alternate intent is specified in any dialog. Relative Colorimetric is a reasonable choice unless you know that almost all of your conversions will be RGB to CMYK for which Perceptual is the appropriate intent option. Always check Use Black Point Compensation. This maps the black point source to the black point destination, avoiding any clipping or flattening of the darkest colours and maintains the full dynamic range.

Now that we have all of our working parameters correctly defined, we can OK the Color Settings dialog and look at the basic mechanism for using colour profiles in the Adobe Creative applications. There are two actions we can invoke from the Edit menu to apply colour profiles: Assign Profile and Convert to Profile.

Assign Profile allows us to select a source profile for the open document. This action will replace the existing profile for a tagged document or provide a new reference for an untagged file. To have the

association persist, you must save the file and check the option to embed the current colour profile. Assigning a profile will change the onscreen appearance of the file but not alter any of the file's tint values (colour data). We are simply instructing the computer on how the original CMYK or RGB values would look if they are coming from our new source (described in the look up table of the new colour profile).

Convert to Profile is an immediate and irreversible (once the file is saved) transformation of the document's tint values. The assigned profile is used as a source and the user selects a destination profile and rendering intent. The conversion takes place and the file now has new RGB or CMYK numbers as a result. If you use the advanced dialog to specify a device link profile, then the currently assigned source profile is ignored for the calculations since the device link contains information for both the source and destination conditions.

Both the Assign and Convert dialog windows come with a Preview check box that will allow you to toggle between the before and after state to visually validate your choices and experiment with the effects of choosing different rendering intents.

Assessing the Effect of a Colour Profile

Once the profile is applied, what should we be looking for? Both on screen and when comparing hard-copy (printed) samples, there are specific areas of the image that should be checked. There is also industry-specific language used in describing colour appearance that it is helpful to be familiar with. The areas of the image to pay special attention to are saturated colours, flesh tones, neutrals, and the highlights. Proof and print sample sheets will have four or five images that emphasize these areas along with tone ramps in the process and overprint colours. Focusing on these areas of interest will make it easiest to identify variation when checking for colour matching.

The terminology that is often employed is *colour cast*, to indicate a shift toward a particular colour; *heaviness*, to suggest excessive tone (particularly in the highlights); *dirty*, to specify too much complementary colour resulting in greying; and *flat*, to describe a lack of contrast and/or saturation. Knowing the terminology will help you understand the comments your co-workers may make and will help remind you of the types of analysis you should be doing.

Additional Colour Tools in Adobe Acrobat

In addition to the fundamental profile handling procedures described above, there are several powerful and useful colour tools in Adobe Acrobat that can be used once you have exported your desktop file to a PDF. These are found among the Print Production Tools in the Acrobat Tools menu. Two are of particular note: Convert Colors and Output Preview.

Convert Colors allows you to convert colour spaces, such as changing RGB content to CMYK. It also enables transforming *spot colours* (such as Pantone) to CMYK. In addition, if the file incorrectly contains multiple instances of a spot colour that should all appear together on the same printing plate (i.e., Pantone 283 and *special blue*), they can be linked to behave as a single entry on the colour palette.

Output Preview does not apply any changes to the file, but is an extraordinarily powerful review

mechanism. It enables you to confirm that colour elements in the file are as they should be before you commit to the expensive step of actual output. With Output Preview, you can turn individual separations on and off to check overprints and knockouts; check the separation list to confirm which elements are attached to each separation; identify the colour space of each object; and even highlight any area that exceeds your threshold for total ink coverage.

Profile Use in Kodak Prinergy

The final topic in our exploration of colour management in graphic technologies is an example of the application of colour management in a print production workflow. We'll use one of the predominant workflow applications, Kodak Prinergy, as a model.

The processing instructions for file handling in Prinergy are contained in a *process template*. Input files are 'refined' to PDF in the Prinergy workflow and an important portion of the refining process is the instructions relating to colour conversions. In addition, we have process templates for output both to proof and final output. These templates also contain colour control options. For both *refine* and *output* process templates, the colour management information is contained in the Match Colors box of the Color Convert subsection.

Prinergy offers a comprehensive colour management application of its own called ColorFlow. There is a check box in Color Convert to turn on ColorFlow awareness and pass all of the colour management decisions to what has been predefined in ColorFlow. Discussing the structure and functional logic of ColorFlow is beyond the scope of this text. To use Prinergy as a more generic workflow example, we'll uncheck the ColorFlow option and turn off the integration.

The standard location to store profiles for use by Prinergy is \Prinergy\ CreoAraxi\data\ICC-Profiles. Profiles are not immediately available from this location in Prinergy's drop-down menus, but can be browsed to if placed in job-specific subfolders.

Let's look at the Match Colors section of the refine process template. With ColorFlow integration turned off, the entry fields under Assign Input Device Conditions become available. If you check Override Embedded Profiles, then profiles that are checked on in the Assign Input Device Conditions section will replace all existing profiles in the files being processed. Notice that there is a very granular level of control, with independent entries for CMYK images, CMYK graphics, RGB images, and RGB graphics. If you specify a device link profile, it will override any tagged profile whether or not Override Embedded Profiles is checked.

Convert to Destination is where you indicate the destination profile. This will only be used for instances not covered by a device link in the assign section. Remember that any device link contains both source and destination information. Beneath the Convert box is a box for selecting rendering intents. Entries are only available for the options that were checked on under Assign Input Device Conditions. The default entry is Perceptual since most input files will require image conversions from larger colour gamuts.

For output process templates in Prinergy, the options are very similar to what has been described above. We typically use colour management for output to proofs, either single page or imposed. There is a separate ColorFlow section to uncheck to enable the more traditional colour management approach. In the Match Colors box, Match Colors in Page Content must be checked on for any colour profiles to

be applied. Also, you must select one of the following radio buttons—As Defined Below, If Not Set in Refining, or Exactly as Defined Below— so you will be able to choose a profile in the Input Device Conditions box. Since all content will now be in the CMYK space from the refine process template, there are no longer independent options for RGB, graphics and images: only one source or device link can be specified. The rendering intent is entered in the Rendering Intent field. The destination profile (usually the proofer profile) goes in the Device Condition box. Once again, this destination profile will be ignored if a device link has been chosen for the source.

By following the steps described, the workflow application user can produce predictable and accurate colour reproduction results through both the file processing and output steps of any print production workflow.

4.12 Summary

Alan Martin

In essence, colour management is a translation process. The tools and precepts of colour science give us the lexicon to populate the dictionaries of each of the devices we use in our graphic technology workflow. Our device's dictionary is the colour profile we generate with the help of a colour target, an instrument to measure the target and colour management software to process the measurements.

Since the device's dictionary (colour profile) defines the specific RGB or CMYK values of that device in a device independent colour language, we have a conduit between any two devices. By aligning the device independent values between the two devices, we can translate from the device dependent values of our source to the new RGB or CMYK values at our destination to provide a common colour experience.

With an understanding of how to configure our standard graphic arts applications to effectively use our device's profiles, we can make successful colour translations happen in our real-world production scenarios. Successful colour translations provide the improved productivity that comes with predictability and confidence in process control.

Questions to consider after completing this chapter:

1. What are the three components of the colour event?
2. How does visible light relate to the electromagnetic spectrum?
3. How does the zone theory of optical systems resolve the apparent incompatibility of trichromacy and opponency?
4. What is the importance of the Lab colour space?
5. Define Delta E.
6. Which of RGB, CMYK, and Lab are device dependent colour spaces, and which are device independent colour spaces?
7. How does a spectrophotometer work?
8. What is the purpose of a colour target?
9. What Mac OS utility can be used to view colour profiles?
10. How does a measurement file relate to an ICC profile?
11. What is the vcgt tag in a display profile?
12. Name the common characteristics of output, display, and input profiles.
13. What characteristics are unique to each of output, display, and input profiles?

14. Working Spaces serve what purpose in Adobe's Color Setup dialog?
15. Which Acrobat tool allows for the merging of spot colours?
16. How do we make a device link profile?
17. Where is a device link profile used in Prinergy's output process template?

Chapter 5. Pre-press

5.1 Introduction

Wayne Collins

Learning Objectives

- Explain why raster image processing requires so much data for print imaging
- Compare resolutions required for digital media and print media
- Compare and contrast the positive and negative attributes between using process and spot colours
- Discuss why Pantone colours are more accurate on a printed swatch than on screen.
- List a number of different industry standard spot colour systems
- Describe trapping issues that occur when adjacent colours are imaged independently
- Analyze different imaging technologies for trapping requirements
- Interpret how black ink is to be used in overprint and boost situations
- Define transparency within the context of prepress workflow management
- Differentiate between flattening transparency on the desktop, or at raster image processing
- Describe the most common press sheet imposition styles
- Analyze different binding styles to select the correct imposition required
- Identify opportunities for nesting multiple images to save materials
- Explain the importance of preflight within the context of pre-press workflow

North America's fifth-largest manufacturing sector is graphic communications technologies. We can become aware of just how huge this industry is by listing all the manufactured images we see in our day. Your list might include the morning paper or magazine you read, the graphic on the side of the bus you ride to work, and the labels on the grocery shelf where you select your evening meal. Increasingly, more of the graphics that are driving that massive industry are produced with computer graphics software on personal computers. Most of the graphics software used to create the images for reproduction is designed to create images for electronic media — primarily the Internet. Computer graphics designers are not aware of, or concerned with, optimizing their designs for the manufacturing process they are driving. This problem is a root cause of less profitability in most sectors of the graphic communications industry. To tackle this problem, we must become aware of all that happens to a computer graphic from the time it leaves the picture created on the computer screen to the image on the label on the package on the grocery shelf, or the photograph on the side of a bus.

We must first distinguish between traditional pre-press technologies and the pre-imaging processes that are relevant in today's graphic communications industry. Pre-press processes are different from

the way we process images for electrophotographic imaging or imaging with an inkjet engine. We must also distinguish between preparing images for a lithographic press and a flexographic press. Electrophotography and inkjet are growing technologies used to produce customized — or individualized — communications materials. Lithography and flexography are used to manufacture mass-produced media products. These four imaging processes are the core imaging technologies that reproduce 90% of the images produced in the graphic communications industry.

Many graphic designers are not aware of what must happen to the computer graphics they produce in order to ready them for manufacturing reproduction. Their experience is limited to hitting ‘command P’ and their computer graphic magically transforming the illuminated masterpiece on their Apple Cinema Display, to the disappointing rendition that appears on the tray of their inkjet printer. Most of the pre-imaging processes are automated in software functions that are built into the print driver, so people are not aware of how a computer graphic must be prepared for an imaging device. Since more and more of the images produced through inkjet, electrophotography, lithography and flexography start their lives as computer graphics, it is important to understand these pre-imaging processes to properly design computer graphics for the manufacturing process.

This chapter will analyze six pre-imaging processes in detail, and describe how they are altered to prepare computer graphics differently for each of the four imaging technologies. We will refer back to the computer graphic design/creation process to outline how graphics could be altered so they can be more effectively reproduced with each imaging technology. This is the missing link in the graphic communications business in today’s marketplace. Designers create computer graphics in software that is increasingly designed for electronic image creation. They do not realize that the same graphic they created for a home page on the Internet should not be used for the cover of a book. They email the image to a lithographic print production facility and the pre-press department of that facility does hand springs trying to alter the image to work on their sheet-fed presses. This adds time and cost to the job that is usually buried. The designer never gets feedback on how the design could be altered to be more effective for lithographic production.

When pre-press was a computer-to-film process, there were two important factors that ensured designers got this critical feedback. The software for computer graphic production was specialized for print creation and content could be photographed or computer-generated and combined on film. Computer graphic designers knew their image was only going to be used for the cover of a book and created it appropriately. They also had to submit their computer graphic to a graphic communications production facility that was separate from the lithographic print facility. If there were extra costs incurred to prepare the computer graphic for a lithographic press, the designer was informed and invoiced for the extra work the image preparation entailed. So the designers were working with computer graphic software that would not let them create imagery that was not appropriate for print production, and if they did dream up an image that did not work well, they were immediately informed of the extra costs they were incurring.

In the 21st-century marketplace, all graphics that drive our four primary imaging technologies are created on the computer. Computer graphics software is designed to create effects for images that will stay in the electronic media: web, broadcast, digital film, and hand-held communication technologies. Pre-imaging processes are either automated or a part of the print manufacturing business and usually considered the painful part of feeding the print machinery that no one wants to talk about. So computer graphic designers drive software that lets them create outrageous images for imaging reproduction manufacture. They are less concerned about the ‘print’ part of a media campaign, and manufacturers

are hesitant to inform them that their designs incurred extra costs to reproduce. We can contribute to a solution to this problem by analyzing all of the pre-imaging processes for each type of reproduction manufacture and link them back to the computer graphic design software.

We will examine six pre-imaging processes:

- Raster image processing (RIP) technologies that are common to all four manufacturing processes
- Colour management for repeatability, as a part of the RIP process
- Trapping to lithographic and flexographic specifications
- Transparency, which is a visual effect that has a great impact on imaging
- Imposition for pre-RIP and post-RIP for media utilization
- Preflight analysis and automation for computer file creation

5.2 Raster Image Processing

Wayne Collins

The raster image processor (RIP) is the core technology that does the computational work to convert the broad range of data we use to create a computer graphic into the one-bit data that drives a physical imaging device. Let's examine the creation of a single character of the alphabet, or **glyph**. A font file delivers PostScript language to the RIP that describes a series of points and **vector** curves between those points to outline the letter A. The RIP has a matrix grid at the resolution of the output device and computes which spots on the grid get turned on and which are turned off to create the shape of that letter A on the output device. The spots on the grid can only be turned on or off — which is how binary data is encoded — either as 0 or 1. The grid then acts as a switch to turn a mechanical part of the imaging engine on or off.

With computer-to-plate technology for lithographic printing plate production, a laser is used to expose an emulsion on a printing plate. Most plate-setters have a resolution of 2,000 to 3,000 lspi (laser spots per inch). The RIP calculates all the spots that must be turned 'on' to create the graphic that will be imaged on the printing plate. If the image fills a typical sheet-fed press, it is (30 inches x 3,000 lspi) x (40 inches x 3,000 lspi) = 1.08 trillion, which takes 10 gigabytes of computer memory to store and transfer. A printing plate for flexographic print production is created by turning a laser on and off at a slightly lower resolution. An inkjet printer uses the same RIP process to deliver the same one-bit data to each inkjet nozzle for each colour of ink in the printer. Most inkjet engines have a resolution between 600 and 1,200 spots per inch — so the matrix grid is smaller — but if it is an eight-colour printer, the data for all eight nozzles must be synchronized and delivered simultaneously. An electrophotographic (Xerox) printer usually has a resolution similar to an inkjet printer and utilizes a similar RIP process to change a grid of electrostatic charges to positive or negative on an electrostatic drum that is the maximum media size the machine can image. Each colour in the printer has a separate **raster image** that charges the drum in the right spot to attract that colour of toner to that exact location. The data for each colour must be synchronized for simultaneous delivery. The data must refresh the charge on the drum after each print in order to pick up new toner. That is a very important fact to remember when we talk about personalizing print with variable data later in this chapter.

This basic understanding of RIP's place in a computer graphic workflow is essential to understanding how to prepare files for, and manage, RIP resources. It is also essential in solving some of the common problems we see in various RIPs. When we compare the two mass production imaging technologies, lithography and flexography, to the personalized imaging technologies, electrophotography and inkjet, we can identify some core similarities. In lithography and flexography, a high-powered laser is used to alter a physical emulsion that is durable and finely grained enough to let the laser image a spot that is one three-thousandth of an inch without affecting the spot of equal size beside it. We can reliably image that spot in a serif of a glyph set in one point type or a hair on a face in a photo that is imaged with a 5 micron frequency modulated (FM) screening pattern. The mass production technology assures us that the first print will be identical to the millionth print.

The raster grid of one-bit data that the RIP produces must be delivered to the imaging drum or the inkjet

nozzle for every image that is produced with an inkjet printer or an electrophotographic engine. This is what allows us to make every image different and personalize it for the person we are delivering the image to. It also makes the process slower and less reliable for mass production. The RIP produces a lower resolution raster grid, so the detail in photos and letter shapes is not as precise. We can have a RIP discard data if we have too much detail for the raster grid it is producing. The RIP does not do a good job of interpolating more data to produce additional detail in a photo or graphic shape if that information is missing to begin with.

That brings us to examining the resources that a RIP must have to produce a perfect raster for every graphic shape it renders, and for every colour being reproduced. The resource a RIP consumes is data. In the graphic communications industry, we should all wear T-shirts that say ‘Pigs for data!’ just to distinguish us from our media colleagues who are producing computer graphics for electronic media. If we think of a RIP as an auto assembly line we are feeding with parts, in the form of files in different data formats, it will help us understand how to make a RIP more efficient. If we feed too many parts into the assembly line, it is easier to throw some parts away than it is to stop and recreate a part that is missing. If we feed the assembly line with five times as many parts needed to make a car, it is still more efficient to throw parts away than it is to stop and recreate a missing part.

If we apply this analogy to image resolution, we can point to examples where designers regularly repurpose images from a web page to use on a book cover or poster print. The web page needs to deliver the photo across a network quickly and only needs to fill a typical computer screen with enough detail to represent the photo. A typical photo resolution to do that properly is 72 pixels per inch. Now remember that the raster grid for a lithographic printing press that will print the book cover is 3,000 lspi. Our RIP needs much more data than the web page image contains! Most of the photos we are reproducing today are captured with electronic devices — digital cameras, phones, scanners, or hand-held devices. Most store the data with some kind of compression to reduce the data the device has to store and transfer. Those efficiencies stop at the RIP though, as this computational engine has to decompress the data before applying it to the graphic page it is rasterizing. It is like breaking a steering wheel down to wires, bolts, and plastic sleeves that efficiently fit into a one-inch-square shipping package, and putting this ‘IKEA furniture’ steering wheel onto an auto production line for the assembler to deal with in two-point-two minutes!

On the other hand, we can capture a digital photo at 6,000 pixels per inch (ppi) and use it on a page scaled to half the original dimension. That is like packing a finished steering wheel in 10 yards of bubble wrap and setting it on the assembly line in a wooden shipping crate! So it is important for designers to pay attention to the resolution of the final imaging device to determine the resolution that the RIP will produce from the graphic files it is processing.

Halftone Screening

It is important to stop here for a discussion about halftone screening that a RIP applies to photographs and graphics to represent grey levels or tonal values in a graphic element. We described how the RIP makes a grid of one-bit data, but graphics are not just black and white — they have tonal values from 0% (nothing) printing to 100% (solid) printing. If we want to render the tonal values in-between in half percent increments, we need 200 addresses to record the different values. Computer data is recorded in bits, two values (on and off), and bytes, which are eight bits strung together in one switch. The number

of values a byte can record is 256 — the number of combinations of on and off that the eight bits in the byte can express. A computer records a byte of data for each primary colour (red, green, and blue — RGB) for each detail in a photo, as a *pixel* (picture element), which controls the phosphors on electronic imaging devices. A RIP must convert the eight-bit RGB values into the four primary printing ink colours (cyan magenta, yellow, and black — CMYK). There are two distinct steps here: (1) conversion from RGB to CMYK continuous tone data (24 bit RGB to 32 bit CMYK); and (2) continuous tone to one-bit screening algorithms. We have to be in the output colour space before we can apply the one-bit conversion. It converts the eight-bit tonal values into one-bit data by dividing the area into cells that can render different sizes and shapes of dots by turning spots on and off in the cell. A cell with a grid that is 10 laser spots wide by 10 laser spots deep can render different 100 dot sizes (10 x 10), from 1% to 99%, by turning on more and more of the laser spots to print. If we think back to the plate-setter for lithographic platemaking, we know it is capable of firing the laser 2,000 to 3,000 times per inch. If the cells making up our printing dots are 10 spots square, we can make dot sizes that have a resolution of 200 to 300 halftone screened dots in one inch. A RIP has screening (dot cell creation) algorithms that convert the data delivered in RGB pixels at 300 pixels per inch into clusters of laser spots (dots) for each printing primary colour (CMYK).

This description of how a RIP processes photographic data from a digital camera can help us understand why it is important to capture and deliver enough resolution to the RIP. It must develop a detailed representation of the photo in a halftone screened dot that utilizes all of the laser spots available. The basic rule is: Required PPI = 2 x lines per inch (LPI) at final size. So if you need to print something at 175 lines per inch, it must have a resolution of 350 pixels per inch at the final scaled size of the reproduction. Use this rule if you are not given explicit direction by your print service provider. You can use a default of 400 ppi for FM screening where lpi is not relevant.

WYSIWYG

It is important to know that each time we view a computer graphic on our computer screen, it is imaging the screen through a RIP process. The RIP can change from one software program to another. This is why some PDF files look different when you open them in the Preview program supplied with an Apple operating system than they do when opened in Adobe Acrobat. The graphics are being processed through two different RIPs. The same thing can happen when the image is processed through two different printers. The challenge is to consistently predict what the printed image will look like by viewing it on the computer screen. We use the acronym **WYSIWYG** (what you see is what you get) to refer to imagery that will reproduce consistently on any output device. Designers have faced three significant challenges in trying to achieve WYSIWYG since the advent of desktop publishing in the early 1980s.

The first challenge was imaging typography with PostScript fonts. The second was colour managing computer screens and output devices with ICC profiles. The third and current challenge is in imaging transparent effects predictably from one output device to another. Font problems are still the most common cause of error in processing client documents for all imaging technologies. Let's look at that problem in depth before addressing the other two challenges in achieving WYSIWYG.

Font Management

The development of the PostScript computer language was pioneered by Adobe in creating the first device independent font files. This invention let consumers typeset their own documents on personal computers and image their documents on laser printers at various resolutions. To achieve WYSIWYG on personal computer screens, the font files needed two parts: screen fonts and printer fonts. Screen fonts were bitmaps that imaged the letter shapes (glyphs) on the computer screen. Printer fonts were vector descriptions, written in PostScript code, that had to be processed by a RIP at the resolution of the printer. The glyphs looked significantly different when imaged on a 100 dpi laser printer than they did on a 600 dpi printer, and both were quite different from what graphic artists/typographers saw on their computer screen. That was not surprising since the shapes were imaged by completely different computer files — one raster, one vector — through different RIP processors, on very different devices. Many graphic designers still do not realize that when they use Adobe type font architecture they must provide both the raster screen font and the vector PostScript font to another computer if they want the document that utilizes that font to process through the RIP properly. This was such a common problem with the first users of Adobe fonts that Microsoft made it the first problem they solved when developing TrueType font architecture to compete with Adobe fonts. TrueType fonts still contained bitmap data to draw the glyphs on a computer screen, and PostScript vector data to deliver to a RIP on a print engine. The TrueType font file is a single file, though, that contains both raster and vector data. TrueType fonts became widely distributed with all Microsoft software. Microsoft also shared the specifications for TrueType font architecture so users could create and distribute their own fonts. The problems with the keeping screen font files with printer font files went away when graphics creators used TrueType fonts.

The quality of the fonts took a nose dive as more people developed and distributed their own font files, with no knowledge of what makes a good font, and what can create havoc in a RIP. Today, there are thousands of free TrueType fonts available for downloading from a multitude of websites. So how does a designer identify a good font from a bad font? The easiest way is to set some complicated glyphs in a program like Adobe InDesign or Illustrator and use a ‘convert to outlines’ function in the program. This will show the nodes and bezier curves that create the glyph. If there are many nodes with small, straight line segments between them, the font may cause problems in a RIP. Remember that PostScript was meant to be a scalable device independent programming language. If the poorly made glyphs are scaled too small, the RIP has to calculate too many points from the node positions and ends up eliminating many points that are finer than the resolution of the raster image. On the other hand, if the glyph is scaled too large, the straight lines between points make the smooth curve shapes square and chopped-looking. These fonts are usually created by hand drawing the letter shapes, scanning the drawings, and auto tracing them in a program like Illustrator. The ‘convert to outlines’ test reveals the auto tracing right away, and it is a good idea to search out another font for a similar typeface from a more reputable font foundry.

Another good test is to look at the **kerning** values that are programmed into the font file. Kerning pairs are glyph shapes that need the space between them tightened up (decreased) when they appear together. A good font usually has 600 to 800 kerning pair values programmed into its file. The most common pair that needs kerning is an upper case ‘T’ paired with a lower case ‘o’ (To). The ‘o’ glyph must be tucked under the crossbar of the T, which is done by programming a negative letter space in the font file to have less **escapement** when the imaging engine moves from rendering the first shape to when it starts imaging the second shape. If we set the letter pair, and put the curser in the space between them, a

negative kerning value should appear in the kerning tool. If no kerning value appears, the font is usually a poor one and will cause spacing problems in the document it is used in.

Another common problem occurred when combining Adobe Type 1 fonts with TrueType fonts in the same document. Adobe was the creator of the PostScript programming language, and although it was easy enough to copy its code and create similar fonts, Adobe has maintained fairly tight control over licensing the PostScript interpreting engines that determine how the PostScript code is rendered through a raster image processor. The RIP stores the glyph shapes in a font file in a matrix that can be speedily accessed when rendering the glyphs. Each glyph is assigned an address in the matrix, and each font matrix has a unique number assigned to it so that the RIP can assign a unique rendering matrix. Adobe could keep track of its own font identification numbers but could not control the font IDs that were assigned to TrueType fonts. If a TrueType font had the same font ID number as the Adobe Type 1 font used in a document, the RIP would establish the glyph matrix from the first font it processed and use the same matrix for the other font. So documents were rendered with one font instead of two, and the glyphs, word spacing, line endings, and page breaks were all affected and rendered incorrectly. For the most part, this problem has been sorted out with the creation of a central registry for font ID numbers; however, there are still older TrueType font files out there in the Internet universe that will generate font ID conflicts in a RIP.

Adobe, Apple, and Microsoft all continued to compete for control of the desktop publishing market by trying to improve font architectures, and, as a result, many confusing systems evolved and were discarded when they caused more problems in the RIPs than they solved. There is a common font error that still causes problems when designers use Adobe Type 1 fonts or TrueType fonts. Most of these fonts only have eight-bit addressing and so can only contain 256 glyphs. A separate font file is needed to set a bold or italic version of the typeface. Some page layout programs will allow the designer to apply bold or italic attributes to the glyphs, and artificially render the bold or italic shapes in the document on the computer screen. When the document is processed in the RIP, if the font that contains the bold or italic glyphs is not present, the RIP either does not apply the attribute, or substitutes a default font (usually Courier) to alert proofreaders that there is a font error in the document. The line endings and page breaks are affected by the error — and the printing plate, signage, or printout generated becomes garbage at great expense to the industry.

To solve this problem, Adobe actually cooperated with Microsoft and Apple in the development of a new font architecture. OpenType fonts have unicode addressing, which allows them to contain thousands of glyphs. Entire typeface families can be linked together to let designers seamlessly apply multiple attributes such as condensed bold italic to the typeface, and have the RIP process the document very closely to what typesetters see on their computer screen. PostScript is also the internal language of most page layout software, so the same OpenType font files are used to rasterize the glyphs to screen as the printer's RIP is using to generate the final output. There can be significant differences in the RIP software, but many font issues are solved by using OpenType fonts for document creation.

One common font error still persists in the graphic communications industry that acutely underlines the difference between creating a document on a single user's computer but processing it through an imaging manufacturer's workstation. Designers usually own a specific set of fonts that they use for all the documents they create. The manufacturer tries to use the exact font file each designer supplies with the document. The problem once again involves the font ID number, as each font file activated in an operating system is cached in RAM memory to make the RIP-to-screen process faster. So the font

files the manufacturer receives can be different versions of the same font created at different times, but assigned the same font ID number. For example, one designer uses a 1995 version of Adobe's Helvetica typeface and another uses a 2015 version, but the two typefaces have the same font ID number. The manufacturer's operating system will not overwrite the first font matrix it cached in RAM, so it is the first font file that renders the document on screen and will be sent down to the RIP. Usually, there are few noticeable changes in the glyph shapes. But it is common for font foundries to adjust kerning values between letter pairs from one version to the next. So if a manufacturer has the wrong version of the font file cached in RAM, a document can have line-ending changes and page reflows. This is a hard error to catch. There are programs and routines the imaging manufacturer can implement to clear the RAM cache, but many times, more 'garbage' is generated before the problem is diagnosed. Modern PDF creation usually includes the production of a uniquely tagged font subset package that only contains the glyphs used in the document. The unique font subset ID avoids the potential for font ID conflicts.

Managing fonts on a single user computer has its own challenges, and Apple has included Font Book with its operating systems to help manage fonts in applications on an Apple OS. Adobe offers Typekit with its latest Creative Cloud software to provide greater access to a wide variety of typefaces from a reliable foundry. Third-party font management programs like Suitcase Fusion also help graphic artists manage their fonts for repurposing their documents effectively. It is still the responsibility of individual operators to know how to use the fonts in their documents. They should also make sure that the fonts are licensed and packaged to deliver to other computer systems so that they can drive many different RIPs on a wide variety of output devices.

5.3 Colour

Wayne Collins

The second challenge with implementing WYSIWYG for electronic documents that are imaged on substrates is managing colour expectations. Chapter 4 discussed the challenges of colour management from the perspective of how we see colour, measure it, and manage output devices with ICC profiles. In this chapter, we will explore colour management from the perspective of how we recognize and manage the ICC profiles that are embedded in client documents. We will also explore the preflight issues in managing spot colours in documents. This will also lead us to a discussion of trapping for lithography and flexography.

To design with colour in computer graphics software, we must understand how the software generates the colour values. Page layout and illustration software usually have several systems for creating colour on a page. The colour settings or colour preferences attached to a file can change from one document to another or in the same document restored from one computer to another. If a designer uses the RGB colour model to specify the colours in a document, the colours on the monitor can change depending on the translations done to the colour settings. This is a major turning point for designers creating documents intended to stay in the electronic media. No one pays much attention to how a particular colour of red is rendered from one web browser to another. Designers pay more attention to how the colours interact relative to one another in web-page documents. It is only when we image a computer graphic on a substrate that we must pay attention to rendering the exact hue of red from one device to another. Coca-Cola has very exact specifications for the red used in its documents that tie into its brand recognition. So designers for documents intended for imaging on substrates must use colour models that are proven to render exactly the same results from one output device to another.

Pantone Colours

This is a lofty ideal that the graphic communications industry aspires to. There are systems in place that are proven to render very accurate results. There are challenges in understanding the systems, and one wrong step in the process and accuracy is destroyed. The process starts with how a designer chooses colours in a document. The most-used system for choosing accurate colours was created by the Pantone company. Pantone has developed a library of ink recipes that are published as swatch books. A designer can buy a printed book of a library of colours that matches an electronic library that can be imported into computer software programs. Designers compare their on-screen rendering of a colour to the printed sample swatch. If a designer is developing a corporate identification package with logos that use Pantone 123 and Pantone 456, the designer can be assured that the documents he or she creates will be imaged with inks that have similar spectral values to the swatch books used to choose the colour. I say similar, because the swatch books fade over time, and the substrates the books are printed on don't usually match all the substrates a corporate logo is imaged on.

It is also important to realize that the Pantone library was created to mix pigments for **spot colour** inks rather than **process colour** inks. Spot colours are mixed independently and must each be applied

to the substrate independently. Process inks are only the four primary colours: cyan, magenta, yellow, and black. Process inks are transparent and are intended to be combined by halftone screening different percentages on a substrate to render any colour in the Pantone library. Spot colour inks are more opaque and are intended to be applied to a substrate one at a time, through distinctly separate printing units. Since most colour photography is colour separated to render the photo in only the four primary process inks, most documents are created intending to convert the spot colours to process colours. They can be imaged with the photographs in the document. A designer must know how many colours the output device is capable of when deciding which colours will remain as spot colours and which will be converted to CMYK process colours. Most inkjet and electrophotographic devices are only capable of imaging with the four process colours. Some lithographic presses have extra printing units that can print spot colours, so six- and eight-colour presses commonly print the four process colours and two (or four) extra spot colours in one pass. It is not uncommon to have 10- and 12-colour flexographic presses that image no process colours but use 12 spot colours. This is because, historically, flexo plates cannot consistently reproduce very fine halftone dots reliably. This is changing with the development of high-definition plating technology, so we are seeing more photographic content produced well on flexographic presses. Flexography is primarily used in the packaging industry where spot colours are very closely tied to brand recognition in retail outlets. A designer must be very aware of the imaging technology used to reproduce a document when deciding which colours will remain spot colours.

This is where the next round of challenges begins when preflighting (assessing) documents for imaging to substrates. If design elements stay as spot colours, it is a simple process to maintain the spot colour on the output device and to image with the appropriate ink or toner. Some software will not maintain the spot colour in a document easily in some situations. Usually, the problem comes with applying gradients to spot colours. It is very easy to introduce a median colour value on a spot colour gradient that is simulated with a process colour value. The screen version displays a nice smooth gradient that looks like what the designer intended to create. When imaging on a substrate, the gradient will have to be broken down into individual colours: from the solid spot colour to a value of CMYK and back to spot colour. It is very hard to recognize this by viewing the document, or even a composite PDF file. Viewing separated PDF files, or using a ‘separations’ tool in Acrobat, will show the problem before it gets to a printing plate.

There are also colour problems associated with nested files generated in different software. For example, if we create a magazine page with a headline colour named “PMS 123,” add a logo created in Adobe Illustrator with type in a colour named “Pantone 123,” and insert a PDF ad created in Apple’s Pages layout with a border specifying “PANTONE 123,” then even though they are all the same, colour-separating software will generate three separate spot colour plates for that page. The spot colours have to be named exactly the same and come from the same library. Some modern workflows include aliasing rules that will match numbered PMS colours to try to alleviate the problem. Colour libraries can be a problem as well, especially if our software allows the library to convert the spot colour to a process colour. The same colour library in two different versions of Adobe’s Creative Suite software can generate a different process colour recipe for the same Pantone colour. This is not a problem if all the document elements are created within one software package and all spot colours are converted to process colours. The problem arises when a designer places a graphic file from other software on a page with the same colour elements. A logo created in an older version of Adobe Illustrator will use that colour library to look up process colour recipes that can be very different from the recipes in a recent colour library used in Adobe’s InDesign software. So all the Pantone orange colours in a document are supposed to look the same, but do not because the spot colour to process colour conversion has not been

done with the same library. The problem becomes worse when we combine files from different software vendors, as designers often have to do when building a document. It is common these days to bring together graphics created in Microsoft Office and Apple software and generate a final document with Adobe InDesign. The best way to create consistent documents for reproduction is to specify a common CMYK colour value that will print reliably on the output device.

Pantone also publishes a swatch book that shows the difference between the swatches run as spot colour ink mixes, and the same swatch printed as halftone screen builds of process inks. This is a designer's most valuable tool for specifying process ink recipes. It also illustrates that many Pantone colours cannot be simulated very well using halftone screen values of the four process inks. It is very apparent that very vibrant orange, purple, and green Pantone spot colours are not achievable with process inks. There are systems like Hexachrome for colour separations that use more than just CMYK inks to extend the gamut of the Pantone colours that can be reproduced. There are also more and more inkjet and electrophotographic engines that will use extra spot colours to extend the colour range of the device beyond CMYK. The businesses that employ those devices usually know they are unique in the marketplace and have developed marketing tools to help designers use those capabilities successfully.

Accuracy in Design

If we reflect back to the concept of WYSIWYG for a moment, we can use the Pantone selection process to illustrate the challenge very well. If we ask a designer to choose colours for a document based on computer screen displays, we know that the RGB or HSL values they can select will be far too vibrant for reproduction with any imaging engine. To set proper expectations for WYSIWYG, we ask the designer to calibrate a monitor and select the proper output profiles to tone down the screen view and set more realistic expectations. We also ask that a print designer use printed swatch books to select from a library of specified colours and assign realistic CMYK process colour values to her or his colour palette. If those steps are followed, there is a very reasonable chance that the process will achieve WYSIWYG. However, it can break down in a few places. The spot colour swatch books set expectations about colours that cannot be achieved with process inks. When a mixture of spot colours and process inks are used, it is difficult to display both on the same computer screen with reliable colour. Graphics files can originate in different software with different libraries using different process colour recipes for the same Pantone colours.

There are also many spot colour libraries to choose from, and designers don't know when to use each library. We have described why the Pantone library is a North American standard, and some of its limitations. There are other design communities in the world that use spot colour libraries that are included as choices in graphic creation software tools. There are almost as many spot colours to choose from as there are free fonts files to download from the Internet. Spot colour classification has led to thousands of discrete colours being given unique names or numbers. There are several industry standards in the classification of spot colour systems. These include:

- Pantone, the dominant spot colour printing system used in North America and Europe.
- Toyo, a spot colour system common in Japan.
- DIC colour system guide, another spot colour system common in Japan.
- ANPA, a palette of 300 colours specified by the American Newspaper Publishers Association for spot colour usage in newspapers.

- GCMI, a standard for colour used in package printing developed by the Glass Packaging Institute (formerly known as the Glass Container Manufacturers Institute, hence the abbreviation).
- HKS is a colour system that contains 120 spot colours and 3,250 tones for coated and uncoated paper. HKS is an abbreviation of three German colour manufacturers: Hostmann-Steinberg Druckfarben, Kast + Ehinger Druckfarben, and H. Schmincke & Co.
- RAL is a colour-matching system used in Europe. The RAL Classic system is mainly used for varnish and powder coating.

The guiding principle for using any of these spot colour systems is to check that the manufacturer of the reproduction is using that ink system. The Trumatch library is quickly gaining favour as a tool for colour selection. That library of spot colours has been developed to be exactly replicated with process colour halftone screening. There are no spot colours a designer can choose from that library that cannot be reproduced well with standard process inks. As more computer graphics are being produced on digital imaging devices that only use CMYK, this colour library is becoming the choice for cross-platform or multi-vendor media publications.

5.4 Trapping

Wayne Collins

Trapping can be a very complex procedure in pre-imaging software for certain imaging technologies. It is an electronic file treatment that must be performed to help solve registration issues on certain kinds of press technologies. Generally, if a substrate has to move from one colour unit to another in the imaging process, the registration of one colour to another will not be perfect. That mis-registration must be compensated for by overlapping abutting colours. As soon as two colours touch in any two graphic elements we must create a third graphic element that contains both colours and overlaps the colours along the abutment line. That third element is called a *trap line* and can be generated many different ways that we will review.

Electrophotography

First let's look at the differences between the four most common imaging technologies and determine where and why we need to generate these trap lines. Electrophotography, or toner-based digital printers, generally use only process colours. Each time an electrostatic drum turns, it receives an electrical charge to attract the toner colour it is receiving. The drum keeps turning until all colours of all toners are on the drum, and then all colours are transferred to the substrate at one time. There is no chance for mis-registration between the cyan, magenta, yellow, and black toners as they are imaged at the resolution of the raster generated by the RIP, and the placement of the electronic charge for each colour can be adjusted until it is perfect, which makes it stable from image to image.

Lithography

Let's compare electrophotography to the lithographic print process. In lithography, a printing plate is generated for each colour and mounted on a plate cylinder. The plates are registered by manually turning wrenches to hold plate clamps, so the plate-mounting procedure can generate registration errors. Each colour printing unit is loaded with a separate ink, a plate that has been imaged to receive that ink, and a blanket that offsets the image from the plate before it transfers it from the blanket to the substrate. This is another mechanical transfer point that can cause registration errors. Most high-end lithographic presses have servo motors and cameras that work together to adjust for mechanical registration errors as the press runs. The substrate must travel from one printing unit to the next, and it is here that most registration errors occur. There are slight differences in the substrate thickness, stability, lead (or gripper) edge, and a different rate of absorbing ink and water that cause slight mis-registration. Also, consider that most sheet-fed litho presses are imaging around 10,000 sheets per hour, and we are only talking about movements of one-thousandth of an inch. On most graphic pages, however, the naked eye can see a mis-registration of one-thousandth of an inch, so the process must be compensated for. The solution is generating trap lines to a standard for lithography of three one-thousandths of an inch. This trap line allowance in abutting colours allows for mis-registrations of two-thousandths of an inch that will not show on the final page.

Inkjet

Inkjet is the next imaging technology we must assess and compare. The print heads on all inkjet machines are mounted on the same unit travelling on the same track. Each ink is transferred one after the other and the substrate does not move after receiving each colour. It is like electrophotography in that mis-registration between print heads can be adjusted electronically, and once in register remain stable for multiple imaging runs on the same substrate. If the substrate is changed between imaging, the operator must recalibrate to bring all colours into registration, and ensure the placement of abutting colours is perfect and no compensation is needed. As a result, no trapping will be needed for most inkjet imaging processes.

Flexography

Flexography is the fourth imaging technology we need to assess. This technology has the most points where mis-registration can occur. The printed image must be raised on the plate to receive ink from an anilox roller that can deliver a metered amount of ink. The computer graphic must be reduced (or flexed) in only one direction around the plate cylinder. A separate printing plate is developed for each colour and mounted on a colour unit that includes an ink bath, anilox roller, doctor blade, and a plate cylinder. The substrate travels from one print unit to the next on a continuous web that is under variable amounts of tension. If a graphic has a lot of white space around it, the substrate can be pushed into the blank space and cause distortion and instability in the shape and pressure of the raised inked image on the substrate. Flexography is used to image the widest range of substrates, from plastic films to heavy corrugated cardboard. This process absolutely needs trap lines generated between abutting colours. Standard traps for some kinds of presses can be up to one point (1/72 of an inch, almost five times our standard litho trap). Graphic technicians need to pay particular attention to the colour, size, and shape of the trap lines as much as to the graphic elements. In most packaging manufacturing plants, there are pre-imaging operators that specialize in creating just the right trapping.

Let's examine some of the ways these traps can be generated. The simplest way is for a graphic designer to recognize that he or she is designing a logo for a package that will be imaged on a flexographic press that needs one-point trap lines generated for all abutting colours. The designer isolates the graphic shapes that touch and creates overprinting strokes on those graphic elements that contain all colours from both elements. That doesn't even sound simple! (And it's not.) It becomes even more complicated when the graphic is scaled to many different sizes on the same package or used on many different packages. So most designers do not pay attention to creating trap lines on the graphics they create and leave it to the manufacturer to create trapping for the specific documents on the specific presses they will be reproduced on.

There is specialized software that analyzes a document, determines where abutting colours are, and generates the tiny graphic lines as a final layer on top of the original graphic. This is done before the document goes to the RIP so it is raster-image processed at the same time as the rest of the document. Most RIPs process PDF files these days, and there are specialized plug-ins for Adobe Acrobat that will analyze a document, generate trap lines, and let an operator examine and edit the thicknesses, shape, and colour of those lines. It takes a skilled operator to examine the extra trap lines and determine if they are appropriate for the press they are going to be printed on. Press operators also need to determine the

trap values of their inks. This refers to the ability of one printing ink to stick to another. Inks vary in viscosity depending on the density and types of pigments they are carrying. The trap characteristics and transparency of a printing ink are part of what determines the printing order in which they are applied to the substrate. For example, a process primary yellow ink is very transparent and will not stick (trap) well if printed on top of a heavy silver metallic ink. The metallic silver is thick and very opaque, so it will hide everything that it overprints. A graphics technician must generate trap lines for a graphic that has metallic silver abutting to a process yellow shape. The technician will increase (spread) the shape of the yellow graphic to go under the abutment to the silver. The silver shape will not be altered, and when it overprints, the yellow ink will stick to and hide the yellow trap line shape. The best analogy, we have heard is from a press person — the peanut butter sandwich analogy. We know the jelly sticks to the peanut butter and the peanut butter will not stick to the bread if the jelly is spread first. If a press person does not know the trap values of the inks, he or she can make as big a mess of the press sheet as an upside-down peanut butter and jelly sandwich makes on the front of your shirt! For this reason, trapping should be left to the specialists and is usually applied to a final PDF file before it is sent to a RIP. Ninety percent of trap lines for lithographic and flexographic imaging reproduction are generated automatically by specialized trapping software. Operators are trained to recognize shapes and colour combinations that will cause problems on the press. They will custom trap those documents with the Acrobat plug-ins we talked about earlier.

Special Consideration for Black

There is one trapping combination that should be considered and applied to all four imaging technologies. It is the way that black ink is handled in the document and applied on the imaging device. Most type is set in black ink, and much of it overprints coloured backgrounds. In all four imaging technologies, black is the strongest ink and hides most of what it overprints. It is still a transparent ink and most process black ink is more dark brown than the rich dark black we love to see in our documents. If the size of the black type or graphic is large enough, we will be able to see the black colour shift as it overprints stronger or weaker colours under it. Graphic designers should pay attention to setting whether black type or graphics overprint the background, or knock out the background to print a consistent black colour. A useful rule of thumb is that type above 18 points should be knocked out and boosted. Raise this threshold for very fine faces such as a script where larger point sizes can overprint, and reduce it for excessively heavy fonts like a slab serif. If the graphic is large enough, it should also be ‘boosted’ with other process colours.

The way we handle black ink or toner deserves special consideration in all four imaging technologies. Black is a supplemental colour to the three primary process colours. It is intended to print only when the other three colours are all present in some kind of balance. In all imaging technologies, we must watch that our **total ink coverage** does not approach 400%, or 100% of each ink overprinting the other inks in the same place. This is usually too much ink or toner for the substrate to absorb. As a result, it will not dry properly and will offset on the back of the next sheet, or bubble and flake off the media in the fuser. Therefore, we must pay attention to how our photographs are colour separated, and how we build black in our vector graphics.

Colour Separations

When colour separating photographs, we can build in an appropriate amount of GCR or UCR to give us the right total ink coverage for the imaging technology we are using for reproduction. UCR stands for under colour removal. It is applied to very dark shadow areas to remove equal amounts of cyan, magenta, and yellow (CMY) where they exceed the total ink limit. For example, in sheet-fed lithography, a typical total ink limit is 360. In areas that print 100% of all four colours, UCR will typically leave the full range black separation, and remove more and more CMY the deeper the shadow colour is. A typical grey balance in shadows may be 95% cyan, 85% magenta, and 85% yellow. Including a 100% black, that area would have a total ink coverage of 365. Other imaging technologies have different total ink limits, and these can vary greatly from one substrate to another within an imaging technology. An uncoated sheet will absorb more ink than a glossy coated sheet of paper and so will have a different total ink limit.

GCR stands for grey component replacement, and it is intended to help improve grey balance stability in a print run and save on ink costs. GCR can affect far more colours than UCR as it can be set to replace equal amounts of CMY with black all the way into the highlight greys. This is particularly useful in technologies like web offset newspaper production. Grey balance is quickly achieved in the **make-ready** process and easily maintained through the print run. Black ink for offset printing is significantly cheaper than the other process colours, so there are cost savings for long runs as well. GCR is used in photos and vector graphics produced for other imaging technologies as well. Any process where grey balance of equal values of the three primary colours could be an issue is a smart place to employ GCR.

You may be wondering how we can check the shadow areas of every photo we use. These GCR and UCR values can be set in ICC profiles by linking the shadow and neutral Lab values to the appropriate CMYK recipes. When the ICC profile is applied for a given output device, the shadows get the proper ink limits, and the grey tones get the prescribed amount of black, replacing CMY values.

Keylines

Black keylines, or outline frames for photos, are common in many documents. This is another place where a document should have trapping software applied for every imaging technology. Outline strokes on graphics can also have a ‘hairline’ setting, which asks the output device to make the thinnest line possible for the resolution of the device. This was intended for in-house studio printers where the resolution is 300 dpi — so the lines are 1/300th of an inch. But the same command sent to a 3,000 lspi plate-setter will generate a line 1/3000th of an inch, which is not visible to the naked eye. These commands must be distinguished in PostScript and replaced with lines at an appropriate resolution — trapping and **preflight** software will do this.

Knock outs

The use of solid black backgrounds is becoming more popular in documents, which can cause problems in reproduction with all imaging technologies. The first problem is with filling in details in the graphic shapes that are knocked out of the solid black background. Fine type serifs, small registered or trademark symbols, or the fine hairlines mentioned above will all fill in and be obliterated when imaged. The

problem is multiplied when we boost the black colour by adding screened values of cyan, magenta, or yellow to the colour block. When white type or graphics knock out of these background panels, any slight mis-registration of any colour will leave a halo of that colour in the white type or graphic. This problem can also be solved with trapping software. Essentially, the trapping engine outlines all the white type with a small 'black only' stroke that knocks out the process colour that boosts the black, making the white type fatter in that colour separation. This 'reverse trapping' works well when applied to the four imaging technologies we have been examining: lithography, flexography, electrophotography, and inkjet.

5.5 Transparency

Wayne Collins

The biggest challenge in reproducing computer graphics on output devices in today's marketplace is dealing with transparency in graphic files. This truly emphasizes the importance of WYSIWYG in proofing for the graphic communications industry. We must first emphasize that page layout graphic software is not developed for producing documents for mechanical reproduction. This software prioritizes the creation of documents for viewing on electronic media; they are created on a computer screen for viewing on a computer screen. We have reviewed some of the issues with rasterizing vector shapes consistently, and reliably representing colour from one device to another. Viewing a graphic with three-dimensional transparent elements is significantly different on an illuminated medium where the light is transmitted compared to an opaque medium where the light is reflected. It is very hard to judge how the transparent effects will translate from one to another. There is room for the same kind of collaborative research in this realm, as there was in developing OpenType font architecture and ICC profiles.

The problems in WYSIWYG production for transparency fall in two categories. The first problem is setting expectations so a designer can make a reasonable prediction of how the document will look when imaged on a given media. The second problem is the sheer proportions of the computational processes we are asking of a RIP. PostScript is a three-dimensional language that allows a creator to stack and prioritize elements on a page. The RIP can literally 'throw away' raster data that is knocked out by graphic elements that completely cover the elements behind. If those elements have to show through the foreground elements by 20%, the RIP must hold much more raster data in physical memory addresses. Many times, data is lost if there are not enough addresses available for the computations, and this can change from one processing of the document to the next.

Designers can employ strategies at each level of document creation to manage these problems. The first strategy is to use layers well in document creation. By isolating different effects on separate layers, it becomes easier to isolate and edit the transparent effects when they don't produce the desired results in the final output. The layers can be included in a PDF file of the document, and this allows the possibility of relatively quick editing in PDF editing software closer to the output stage. This can be a completely different working style for some graphic artists. If we start with the premise that the computer screen representation of the document is NOT good WYSIWYG and will probably need editing, then we can justify working with layers more to isolate effects. We can organize design elements on layers after creation — when we are fine-tuning the effects. Usually, this is a good technique when creating many elements on several page dimensions. Designers can review their documents and decide if there are distinct dimensional levels, as page elements are pushed further into the background to pull other page elements forward. A simple example is a book cover for a retrospective, with pictures from four distinct decades. The photos and type from each decade can be set on distinct layers, and transparent values of 25%, 50%, 75%, and 100% can be set for each layer. The screen will render one version of the document, and the printer will render another. It is easier to fine-tune the four layer levels of transparency than to go back and set new transparency levels for dozens of individual page elements.

Another strategy that must be considered for processing multiple transparent page elements is allowing the page layout software to raster the page elements, so it sends raster data to the RIP. This technique treats the transparent elements, such as a photograph on the page, and allows the creator to choose the resolution of the raster. Care must be taken here to ensure overlapping vector elements will raster at the same resolution in the RIP. Let's say we have a type block that crosses a photo on the page, but it is transparent to let the photo show through the type. If we rasterize the transparent type at 300 ppi — the resolution of the photo — it will be significantly different from the raster of the vector type at the RIP, which might be 3,000 lspi for some plate-setters. The letter shape will be 10 times thicker over the photo, and that will be VERY noticeable if the type crosses the photo in the middle of the glyph. The solution is to make sure to raster the transparent type at 3,000 ppi to match the plate-setter raster. This makes the PDF file very large because it contains lots of raster data. But this solution is also a disadvantage because it does not allow late-stage editing of the transparent values in the PDF file. The advantage is that the transparency elements will have better WYSIWYG, process more consistently in multiple RIPs, and use less RIP resources in processing.

It is very important to be aware of the transparent elements you are creating in a document. It is not always apparent when using effects, plug-ins, or effects filters available in page layout software. Using a bevel or emboss effect, or a simple drop shadow, makes that page element use transparent routines in the RIP. Programs like Adobe InDesign let designers view all the transparent elements on a page. Designers should examine each one to decide if it should be rasterized before RIP-ing or at the RIP. This is a good point at which to decide if transparent elements can be grouped, or organized, on common layers. It is also a good point to decide how the transparent element contributes to the design, and how critical the level of transparency, or WYSIWYG value, is in the overall design. In the retrospective book cover design referred to above, WYSIWYG is very important in communicating the message of the book and getting predictable results.

Transparent elements can be rasterized at the page layout stage, the PDF creation stage, and at the RIP stage for the final output device. Adobe Acrobat also has a tool to view transparent elements in a PDF file. It is important for a designer to compare the transparent elements in the PDF to those in the page layout software. The primary concern is that the elements rasterized in the PDF are no longer editable, so it is critical that the levels are right to create the desired overall effect. It is also important for a preflight operator to view the transparent elements in a PDF file to check what the RIP will have to process and to make sure the computational resources are available. If there are processing errors in the final output, they are most likely to occur in rendering the transparent objects. Viewing the transparent elements on a page in Acrobat should provide a mental checklist for the operator when she or he views the final output.

Communication Is Key

The graphic communications industry still has collaborative work to do to make the processing of transparent elements on a page more predictable and repeatable. It is important for designers to understand the problems they can be creating for a RIP, especially for output on an extremely high-resolution device like a plate-setter for waterless lithography. It is also important for operators who are managing documents with lots of transparency to be aware of the checkpoints in a document, and to know when there is not adequate WYSIWYG for the transparent elements on a page. Good questions for all stakeholders to ask when processing a document that relies on many transparent elements are:

- Where are the transparent elements?
- Did they process correctly?
- Is anything missing in the layers that should show through the transparency?
- Are there transparency values that can be adjusted to optimize the overall effect?

Let's review the primary tools for reproducing transparent page elements in a document. We can utilize layers in a document for setting common transparency values. We should view all transparent elements in a document before and after creating a PDF file. There are several stages to rasterizing the transparent elements. The earlier we rasterize them, the less editable the document becomes, and the more consistent the final output will be. We are creating a larger file to process when we rasterize transparent elements early. Much less computational resources are required at the RIP, and the more predictable our final output will be. When managing late-stage processing of transparency, we must be aware that what we are viewing on a computer screen is not necessarily a good representation of the final output. Graphic artists at all levels of production must pay attention to the transparent areas of a document to check for accuracy.

5.6 Imposition

Wayne Collins

Imposition of individual graphics page files serves two primary purposes. The first, and perhaps most important purpose, is to utilize media and manufacturing equipment with the most economic efficiencies. The second is to add what has historically been referred to as ‘furniture’ to the manufactured sheet to control processes. We will discuss both priorities for each primary imaging technology we are examining in this book. There is also a range of equipment capabilities for each technology that affects how documents are imposed. There are a few ways to impose the files either pre-RIP or post-RIP. We will also look at ways of imposing in graphic creation software and in specialized imposition software.

The first technology we will look at is electrophotography, where imposition is perhaps the most underutilized. Electrophotographic, or Xerox-type copiers are usually used for short-run lengths with demands for instant turnaround. Duplexing is the simplest type of imposition, but there are four choices for how to orient the back of a single page on the front. The duplexing style can be specified in the print driver, in the PDF file, or in the RIP. Most small printers will turn on duplexing, rather than image the fronts, turn the printed paper over the right way, and image the back of the sheet. Fewer will take the time to utilize the machine and media capabilities to step and repeat an image two up on a larger sheet to half the run time. Yet, as a manufacturing process, electrophotography is the slowest technology for image reproduction, and the most in need of saving time. There are simple rules of automation that can be programmed in a RIP to automatically impose if a run length is over 100 copies. For example, letter-size documents are the most often imaged on this type of equipment. If run lengths of more than 100 copies were imposed two up on a tabloid sheet, it would halve the run time and open up more imaging time on the machine. This introduces another process — cutting the sheets in half before final delivery. Management can determine how well the imaging engine run time is utilized and when it is efficient to have the same operator cut printed sheets in half. Making that management decision requires a knowledge of workflow options for efficiency. Those efficiencies are the primary purpose of implementing imposition software.

Using a ‘step and repeat’ or ‘duplexing’ imposition of single-page file is the simplest example of imposing files for electrophotographic workflows. More and more copiers have capabilities to fold and bind the finished product ‘inline’ in one continuous process. This process is driven by imposing the single-page files in the correct order as they are processed in the RIP, so they image in the proper spot on the media to fold, and bind together in the correct order.

Imposing page files for binding styles usually follows two types of machine capabilities: saddle stitching and perfect binding. **Saddle stitching** is a binding process that folds the media after it is imaged on both sides, stacks the printed folded sheets one inside the other, and applies staples to the spine of the book. The other dominant style of book binding built into copiers is **perfect binding**. Media is imaged on both sides and folded, but the folded sheets are stacked on top of each other, glue is applied, and a cover sheet is wrapped around the glued book to encase the spine. The pages have to be imposed in a completely different order on the printed sheets. The first and last sheets of a saddle-stitched book are imaged on the

same sheet, whereas a perfect-bound book has the first pages imaged on the same sheet, and last pages on separate sheets of media.

There are many options for folding a sheet of substrate before binding it together. The options increase the larger a sheet is. An imposition must account for the preferences that are best practices for the specific machines involved. If we look at sheet-fed lithography first, we can identify some common best practices that can also apply to toner-based electrophotography and inkjet. We shall leave an examination of imposition for flexography to discuss nested dieline shapes for packaging applications.

Imposition standards are based on workflows for standard-sized pages, primarily letter-sized pages measuring $8\frac{1}{2}$ " x 11". We speak of *two up* devices that can generally image substrates up to a maximum size of 12" x 18" or 13" x 19." Two up devices can accommodate two letter-sized pages plus bleeds, grip, marks, and colour bars — sometimes referred to as furniture on an imposed sheet. These four elements all serve a purpose in page reproduction manufacturing that we shall define later. *Four up* devices generally accommodate imaging substrates up to 20" x 29" to image four letter-sized pages. Forty-inch devices are referred to as *eight up* and image on a maximum sheet size of 30" x 40", which can image eight letter-sized pages and the furniture mentioned above.

There are four common styles of imposition for eight up devices: sheet-wise, work and turn, work and tumble, and cut and stack.

Figure 5.1 work and turn(a)

Work and Turn

Figure 5.2 work and turn(b)

Work and Tumble

Figure 5.3 work and tumble

Figure 5.4 cut and stack

Sheet-wise impositions image the fronts of all pages on one side of the sheet and impose all the backs on a separate set of plates for a press run that will back up all the sheets. Work and turn imposes the fronts on one half of the sheet and the backs on the other half, with the axis running perpendicular to the grip of the sheet (see Figures 5.1 and 5.2). Work and tumble imposes all fronts on the bottom half of a sheet and backup images on the top half of the sheet (see Figure 5.3). The sheets are flipped halfway through the press run, with the axis parallel to the grip edge of the sheet. Cut and stack imposes the pages so full press sheets can be collated, and the collated sheets cut and stacked in order on top of each other to make a final book (see Figure 5.4).

Lithographic web offset presses have imposition orders that depend on how wide the web of paper is, and how many web rolls and half rolls will be brought together before folding on a first former, and cutting on a second former. There are many options for configuring a web-fed litho press, depending on the number of pages in a publication. Usually, the entire publication is printed and folded by running the stack of web paper together and folding it in half over a former.

Imposition has to account for creep and bottling when imposing for thicker publications. *Creep* pushes the image on a page closer in to the spine the further the page is toward the spine, by the width of the thickness of the publication at the stapled, spine edge. *Bottling* skews the image on a page to account for the skewing of web rolls of paper that are folded in very thick signatures. The thicker the folded signature of a bound book, the more skewing takes place, which should be accounted for in the ‘Bottling’ value in an imposition.

Imposition for inkjet mediums is usually done when the image is rasterized. The RIP will store the raster image and nest several raster images together to fill the dimensions of the media being imaged. This is usually set as an automated function in the RIP, and is tied to the size and cost of the media being used. When imaging very low resolution images on very low cost media, the manufacturer is usually more concerned with the speed of the machine than the utilization of the media. If an expensive media is being used, the automatic imposition will be utilized in the RIP to save media. Often inkjet images are not square, and the media will be die cut or cut with a router after imaging. The RIP can be set to

impose the images so the shapes nest inside each other. This is usually outside of the automatic features for imposition in a RIP, and requires operator intervention. In that case, the imposition operator must know the die cutting or router processes very well to make sure the imaged media can be cut out even though it is nested with another image.

This nesting of images to be die cut after imaging is most prevalent in flexographic printing for packaging. Most package or label shapes are not square and the media is expensive. The imposition function becomes very important for preparing flexographic plates. Nesting the die cut shapes for several packages together on a continuous roll of media takes very specialized software and a highly skilled operator. There are many variables to consider, including media thickness, ink coverage, die shapes, glue releases, and image floor on the flexo plate. Flexo imaging for packaging generally takes more understanding of CAD software and the construction of the final three-dimensional product. Imposition operators must know the structural requirements as well as the press limitations to nest together several package images on the same press run.

The final consideration for all impositions in all imaging technologies is the computer resource requirements for the RIP. We usually require an imaging engine to raster a single document, and proof it one page at a time through a proofing device. When we impose the same document with many other pages in completely different orientations, sometimes RIP processing errors can occur. Fonts drop out, and more commonly, transparent elements do not process properly. This is another checkpoint to make sure the imposed image matches the proof of the single page. It is essential to discuss preflighting for print at this point to establish where the routine checkpoints in document processing should be.

5.7 Preflight

Wayne Collins

We have covered quite a few parameters that must be considered when preparing a computer graphic for manufactured image reproduction. The parameters shift with different substrates and imaging technologies. The task of checking a computer graphic document in preparation for the manufacturing process is called preflight. Most graphics are created by designers who are working separately from the manufacturer. In some cases, preflight preparation is the responsibility of the designer, or graphics creator, and in some cases, it is the responsibility of the manufacturer. Some manufacturers charge extra if they have to correct a graphics file that is not prepared properly for their imaging process. Most do not charge extra for preflighting, trapping, or imposing a file for their imaging process. Problems occur when all parties believe a file is prepared properly, but it causes errors in the RIP process. A poor font, improper colour separations, and transparency settings that drop out layers on a page are problems that occur most often. This is when time, materials, and money are wasted, and critical media campaign deadlines are missed. Preflight tries to catch the problems before they reach the RIP.

Designers or graphics creators can purchase separate preflight software that will generate reports about a PDF or PostScript file before they submit it to a manufacturer. The most popular dedicated preflight software is from Markzware and is called FlightCheck. There are also a few other companies that are popular in the marketplace. Enfocus bundles its preflight software with a suite of PDF editing tools called Pitstop. The Adobe Creative Suite has preflight functions built into its software suite. Adobe InDesign is the page layout software of choice for creating multi-page documents such as brochures, pamphlets, or books. The preflight module in InDesign will generate a report that can be included with the packaged contents a designer should provide to a manufacturer. The report will list important information about the InDesign document, such as that found in the list below. Adobe Illustrator also has a built-in preflight tool, and Adobe Acrobat has preflight tools that designers should use to analyze their PDF files before submitting them to a RIP.

Various industries have set PDF standards. The magazine publishing industry, for example, developed a PDF/X standard to ensure PDF/X files can be written only if they meet a set of specifications that are common for lithographic magazine production. Other manufacturing processes adopted the standards if they were appropriate for their imaging technology and PDF workflows.

Most preflight software checks for the following elements in an electronic document:

- File format
- Colour management
- Fonts
- Spot colour handling
- Page structure
- Thin lines
- Black overprint

- Trapping

5.8 Summary

Wayne Collins

This chapter has looked at computer graphic creation through the lens of a manufacturer that must reproduce the electronic image on a substrate. The image must be processed through a RIP that drives a laser, or other imaging technology, to transfer pigments to that substrate. There are unique variables that must be considered in preparing the computer graphic for the reproduction process. We have explored routines for processing vector data such as fonts through a RIP, spot colour handling, trapping, and imposition. The next chapter will look at each of the imaging technologies in more depth.

Questions to consider after completing this chapter:

1. Describe six pre-imaging file analysis processes that should be considered when developing a computer graphic for reproduction manufacture.
2. Describe four major imaging technologies that utilize computer graphics to image on different substrates.
3. Describe the difference between raster data and vector data when creating a computer graphic file.
4. Compare the raster resolution of the data for a typical lithographic plate-setter compared to the resolution of a typical inkjet device.
5. How many addressable values can be recorded in an eight-bit byte of computer data?
6. What does the acronym WYSIWYG stand for?
7. How many kerning pairs are present in a 'good' font file?
8. What colour matching library has been developed exclusively for process colour printing inks (CMYK)?
9. What two printing processes must have trapping applied to computer graphics files before making printing plates?
10. What can a page layout artist do to a graphics file if the transparent elements on the page are dropping out or not processing in the RIP?

Chapter 6. Imaging

6.1 Introduction

Roberto Medeiros

Learning Objectives

- Describe digital printing methods and their differences
- List the various inks used in inkjet printing and their characteristics
- Identify the key components of electrophotography
- Explain the seven steps of the electrophotographic process
- Describe the differences between toner types and how they affect imaging
- Evaluate the suitability of a paper for a project based on its characteristics
- Convert between paper basis weights and grammage
- Describe the key differences between page description languages
- Acknowledge the historical significance of Postscript in desktop publishing
- Explain the differences between PDF/X versions
- Describe the function of a RIP in a DFE
- Explain why calibration is critical in electrophotography
- Describe the key component in variable data printing
- Identify key benefits of open standard VDP formats

Digital printing can be defined as the reproduction of an image or document onto a substrate, directly from an electronic file, without the use of a fixed image plate. Traditional printing transfers an image permanently onto a fixed image plate, whereas digital printing transfers the image temporarily onto a photoconductive cylinder, called a drum, or directly onto the substrate itself. Printing in this manner provides some unique capabilities that sets it apart from traditional print methods. There is virtually no set-up or make ready, finishing tasks can be accomplished inline, and each sheet can have unique content, which makes this printing method ideal for publication printing, short print runs, or highly dynamic content.

The two most common digital printing methods in use today are electrophotographic (toner based) and inkjet (ink based). Both technologies are used in a wide range of printing devices from small desktop printers to large high-volume, high-speed digital presses. The term *digital press* is often used to describe commercial digital printers. In the past, speed was the determining factor of this designation. Today, we have specific criteria published by Idealliance, a not-for-profit member organization that develops standards and best practices for the digital media supply chain (Idealliance, n.d.). Apart from

speed, colour accuracy to meet a specification and consistency over long print runs are key parts of [Idealliance's certification](#) process.

For the purposes of this text, we will focus on digital printers and presses used in commercial printing rather than on consumer or office printers.

6.2 Inkjet

Roberto Medeiros

Inkjet printing is a type of digital imaging where drops of ink are jetted onto the substrate in a very precise pattern from a nozzle. This nozzle, also called the print head, is required to be very precise and accurate, which is a challenge when you consider that the goal is to get many thousands of tiny drops of ink to land exactly where needed on the printed surface. Over time, inkjet technology has become more advanced, allowing greater resolution, more accurate colour, and overall, finer visual fidelity to the original. The most common method of inkjet printing for commercial purposes is called drop-on-demand (DOD). This type of inkjet print head only fires each individual droplet of ink when needed (on demand) and comes in two types, thermal or piezoelectric (see Figure 6.1). Accuracy in DOD inkjet printing is achieved by keeping the print head close to the surface being printed (substrate) as the velocity of the jetted ink is low.

Figure 6.1 Piezoelectric head on the left, thermal on the right

Thermal Inkjet

In a thermal print head, each nozzle contains a special reservoir that is bounded by a heating element. When current is passed through the heating element, it causes the ink to expand rapidly, ejecting out of the nozzle to land on the substrate in a given position. The print head is made up of a matrix of many of these chambers, and each print head is connected to a different colour of ink. As the ejected ink leaves the chamber, fresh ink is drawn into the reservoir by surface tension and the vacuum created by the previous drop of ink leaving.

Thermal inkjet is most common in household and consumer grade inkjet printers. A major benefit to using thermal printhead technology is the relatively inexpensive print head. Since each colour printed requires a separate print head, and some print devices can contain eight or more colours of ink, thermal

technology keeps the initial cost of the device low and reduces replacement costs when a print head fails, or is damaged.

Piezoelectric Inkjet

Piezoelectric (piezo) print heads also use a tiny reservoir to hold a droplet of ink. However, unlike thermal printheads, piezo heads contain a small flexible membrane, or diaphragm, that moves up and down to squirt the ink out of the print nozzle. The pressure caused by the flexing of the piezo material is very precise, allowing a drop, or multiple drops, to strike the substrate accurately. Similar to thermal, the print head is made up of a matrix of a number of these individual nozzles. And by using multiple print heads, multiple colours are possible.

Piezoelectric is more common in commercial and large-format printing applications, although there are a few consumer grades of printers that use piezo as well. Piezo is more accurate, and because the ink in the chamber doesn't have to be vaporized to form the droplets of ink, piezo can print with a wider variety of inks such as aqueous, ultraviolet, and latex.

Types of Ink

Inkjet printing has become more advanced not only in the mechanics of how the print heads work, but also in the variety and usage of different types of ink. Below are some common types of ink and a brief explanation of how they might be used.

Aqueous Ink

Aqueous ink, as discussed earlier, is a water-based ink. This type of ink is used in consumer printers using thermal technology, but can also be used in commercial piezo printers as well. Aqueous is well suited to thermal technology because the formulation of the ink allows it to vaporize in the print head for expulsion onto the paper. The water component of the ink, however, also contributes to its greatest drawback: the susceptibility of the finished printed piece to run or smear if it gets wet. Many users of desktop printers in their homes have been disappointed when they take their printed pages outside in the rain. Even a few drops of water can cause the ink to run and bleed into the paper.

In commercial uses, aqueous inkjet is well known for colour fidelity and quality, but the finished piece has to be protected from moisture. These types of print products would most likely only be used indoors, mounted behind glass, or with a laminated plastic layer on top. There are water-resistant coatings that can be sprayed onto a finished product, but even then, you would not want to leave it outside for an extended period of time. Aqueous ink is a common choice for art prints.

Ultraviolet Inkjet

Ultraviolet (UV) ink is a type of **energy-cured ink** that stays wet until it is bombarded with ultraviolet radiation. This UV radiation is commonly projected onto the freshly printed surface by means of a special high-intensity light bulb. Once the UV rays hit the ink, a special molecular process is triggered,

causing the chains of molecules in the ink to bond and solidify instantly. UV ink does not dry from exposure to air, nor from heat. Once the UV ink has been cured, however, it is very solid and quite durable.

For commercial use, UV inks tend to be popular for outdoor uses such as banners and signage. Indoor signage is commonly printed using UV as well because of its durability and rub resistance. Since UV inks dry instantly, they can be removed from the printer and handled much sooner. UV inks sit mostly on top of the surface of the substrate, and because of their solid bond are more prone to cracking if bent or folded. UV is not a good choice of ink where flexibility of the substrate is required.

Latex Inkjet

Latex ink is a newer formulation that has exploded onto the inkjet printing scene in the last few years. Latex inks are water based and cure primarily through heat, but more importantly, they are not subject to moisture damage once cured. This is because the pigment is carried by the latex molecules, and once the latex has bonded to the substrate, the pigment stays intact. Latex printed products dry immediately and are ready to use as soon as they come off the print device.

Latex inks are used in many commercial applications, particularly where outdoor durability and flexibility are needed. One of the many common uses of latex inkjet printing is in imaging car wraps. A car wrap is a flexible adhesive material that is printed flat, then stretched or wrapped around the contours of a vehicle, usually for marketing or advertising purposes. [Figure I.1](#) in the introduction of this textbook shows an example of a car wrap. Because of this flexibility, latex printed signage can also be adhered to rougher surfaces such as wood or brick. The popularity of latex can be attributed to a previously popular inkjet formulation that is solvent based.

Solvent Inkjet

Because of the rise in popularity of latex ink over the last few years, there has been a great decline in the use of solvent inkjet inks. Formerly, this was the type of ink needed for flexible, durable printing. Solvent inks are formulated using solvent as a carrier for the pigment, and as the solvent dries, the pigment remains bonded to the substrate. A big concern for the use of solvent-based printing is the release of volatile organic compounds, or VOCs. These VOCs are released into the atmosphere during the printing and drying of solvent prints, and have to be vented outdoors so as not to pollute the workspace. Even newer eco-friendly inks still release VOCs, albeit at a lower level. Some areas have environmental laws that restrict the release of pollutants into the air (United States Environmental Protection Agency, 2000). Customers often complain about the smell of solvent prints, particularly when used indoors. Because of this, solvent inkjet is primarily chosen for outdoor uses such as large-format signage, banners, and car wraps. Solvent can be very economical, and while the quality isn't as sharp as UV or aqueous, it is excellent for very large projects that will be viewed from even a moderate distance. Pressure on the solvent ink market comes because most of these uses can now be achieved with latex inks as well, and the industry has seen a divergence between companies that still use solvent or eco-solvent inks and those that are switching to latex.

6.3 Electrophotography

Roberto Medeiros

Electrophotography (also known as xerography) is a complex process commonly used in copiers and faxes, as well as in digital printers. It is an imaging technology that takes a digital file and utilizes a photoreceptor, light source, electrostatic principles, and toner to produce the printed output. Before this process was used for digital printing, it was extensively used in analog copiers where a lamp illuminated the page being copied, and then a series of mirrors reflected the page directly onto the surface of a drum. Digital copiers replaced the direct light path with a sensor that converts the analog image into digital information, then a laser or an **LED** array writes the image onto the drum. Many digital printers today are based on the same platform as digital copiers. The technology has seen many improvements over the years, but the electrophotographic process at its core remains relatively unchanged.

Photoreceptor

The photoreceptor is commonly referred to as a drum. It is a cylinder coated with a material that becomes conductive when exposed to light. Areas that are not exposed have a high resistance which allows these areas to hold the electrostatic charge necessary for the process.

Light Source

Light sources used in digital printing include LED arrays or, more commonly, lasers. VCSEL (vertical cavity surface emitting laser) is an advanced type of laser used in the most current digital presses in the market. A VCSEL array can position its beam with high accuracy (addressability) for optimal clarity, resolution, and image positioning. This makes it ideally suited for a digital press.

Electrostatic Principles

Figure 6.2 Like charges repel each other while opposite charges are attracted

To understand electrophotography, we must first understand some basic electrostatic principles. When certain materials come in contact then separate from each other, these materials can become electrically charged. Rubbing these materials together can increase this effect. This is called the **triboelectric effect**. Static electricity buildup on your clothes in a dryer or from rubbing a balloon on your hair are examples of the triboelectric effect. Charges can have either a positive or negative polarity. Like charges repel each other while opposite charges are attracted, in much the same way as the polarities in magnets (see Figure 6.2).

These properties are at the core of the technology and are utilized in almost every stage of the digital imaging process.

Toner Basics

Toner is a very fine, dry powder medium used in the electrophotographic or xerographic process. It is composed primarily of a resin and includes pigment, wax, and process-enhancing additives. The term *xerography*, in fact, is derived from the Greek words *xeros*, 'dry' and *graphia*, 'writing,' reflecting how toner rather than ink is used in the imaging process. Toner particles become electrically charged when stirred or agitated through a triboelectric effect. The composition of the toner not only contributes to its imaging characteristics but to its ability to maintain and control its charge properties. The shape of the toner also is a factor in its charging capability. This electrical charge is what allows the toner to be precisely manipulated throughout the process.

There are two basic types of toner production, pulverized and chemical (Figure 6.3). Pulverized toner was commonly used in earlier digital printers and is manufactured by successive compound mixing and grinding steps until the desired consistency and size is achieved. The resulting toner particles are irregular in size and shape and typically average around 6.2 to 10.2 microns in size. Pulverized toner produces good results, up to 600 dpi resolution; however, a consistent size and shape along with a smaller particle size is required to produce better clarity and detail at higher resolutions.

従来の粉砕トナー
(Conventional pulverized toner)

EA-HGトナー
(EA-HG toner)

Figure 6.3 Two basic types of toner production

Chemical toners were introduced later to overcome those limitations and are in common use today. Each manufacturer has its own process for creating this type of toner and unique names as well. Xerox's EA toner, Ricoh's PXP toner, and Konica Minolta's Simitri toner are all examples of chemical toners. As the name suggests, chemical toners are created through a process of building or 'growing' the particle chemically. This process allows for the precise control of the shape and size of the toner particle (under 5 microns in some cases), resulting in higher definition and resolution capabilities. Resolutions of 1,200 dpi and 2,400 dpi are possible largely due to the use of this type of toner. Other benefits include much lower energy consumption, both in the manufacturing process and printing process, as well as narrower particle size and charge distributions.

Here is a YouTube video of [how chemical toner is made](https://youtu.be/852TWDP61T4): <https://youtu.be/852TWDP61T4>

Dry toner comes in two forms: mono component and dual component. Both rely on magnetic iron or iron oxide particles to 'hold' the charged toner on a magnetic roller. Mono component toners incorporate the magnetic material in the composition of the toner particle itself where dual component toners have the magnetic material mixed together with the toner but as separate components. This mixture is called developer.

ElectroInk

ElectroInk is a unique form of toner used in HP Indigo digital presses. The toner comes in the form of a paste and is mixed internally in the press with imaging oil, a lightweight petroleum distillate. This type of toner is considered a liquid toner as the particles are suspended in the liquid imaging oil, but still uses an electrophotographic process for imaging. One of the important advantages of this type of toner is its particle size. ElectroInk toner particles are 1 to 2 microns, significantly smaller than the smallest dry toner particle. At this size, a dry toner would become airborne and would be very difficult to control. The toner and oil suspension achieves higher resolutions, uniform gloss, sharp image edges, and very thin image layers. A thin image layer allows the toner to conform to the surface of the substrate, producing a consistent look between imaged and non-imaged areas. A drawback of this toner, however,

is that substrates may need to be pre-treated in order for the toner to adhere properly. There are substrates available for use specifically on HP Indigo digital presses, but typically these are more expensive or may not be compatible with other printing methods. Some Indigo presses are equipped with a pre-treating station that expands substrate compatibility extensively and even surpasses that of other forms of digital printing.

Nanography

Nanography is a very new and exciting print technology currently in development by the creator of the Indigo digital press, Benny Landa. It borrows some of the same concepts used in the Indigo but with a different approach to the implementation of these. The technology centres around NanoInk, a breakthrough ink with pigment sizes in the tens of nanometers. In comparison, pigments found in good-quality offset inks are in the 500 nanometre range. Colorants intensify and ink density increases at this microscopic level, thereby expanding the ink's colour gamut considerably. The ink uses water as a carrier instead of imaging oil making it more cost effective and eco-friendly. Billions of ink droplets are jetted onto a heated blanket, not directly onto the substrate as in inkjet printing. The ink spreads uniformly on the blanket and the water quickly evaporates leaving only an ultra-thin (approximately 500 nanometres), dry polymeric film. This film transfers completely onto the substrate on contact and produces a tough, abrasion-resistant image. This print technology can be used with almost any substrate without pre-treatment and, due to its minuscule film thickness, does not interfere with the finish. Whether high gloss or matte, the ink finish matches that of the substrate. Although the technology is poised to revolutionize the print industry, the first press to use it is currently in beta testing. You can find the latest news and more information on nanography on this [webpage](http://www.landanano.com/nanography): <http://www.landanano.com/nanography>

6.4 Electrophotographic Process

Roberto Medeiros

The electrophotographic process consists of seven stages (see Figure 6.4). For the purpose of this text, we will be describing the process using a negatively charged dry toner. The process is the same for a positive toner except the polarity would be reversed in each stage.

Figure 6.4 Electrophotographic Imaging System

Charging

In the first stage, a high negative voltage of approximately -900 volts is provided to a charge roller (see Figure 6.5). The voltage used varies by manufacturer and model. The charge roller applies a uniform layer of negative charge to the surface of the drum. The resistivity of the unexposed photosensitive drum coating allows the charge to remain on the surface.

Figure 6.5 Charge roller

Exposure

A laser is used to write the image onto the charged surface (see Figure 6.6). Because the photosensitive coating on the drum becomes conductive when exposed to light, the charges on the surface of the drum exposed to the laser conduct to the base layer, which is connected to a ground. The result is a near zero volt image and a negative background. This is known as the latent image.

Figure 6.6 Exposure

Development

Many digital printers and presses use a dual component development system (see Figure 6.7). The developer is a mixture of non-magnetic toner and a magnetic carrier. As the developer is stirred and the particles rub up against each other, a triboelectric charge is generated between the them. The toner becomes negatively charged while the carrier becomes positive. The opposite charges cause the toner to be attracted to the carrier. A magnetic development roller holds the mostly iron carrier in alignment with magnetic lines of force forming a magnetic brush. This magnetic brush in turn 'carries' the attracted toner to the surface of the drum. A high negative bias is applied to the development roller repelling the

toner onto the drum. The toner is attracted to the areas of the drum exposed by the laser, which, being close to zero volts, is much more positive than the negatively charged toner. In this way, the latent image is developed. As the carrier remains on the development roller, it continues to attract toner from the hopper to maintain the optimal concentration on the magnetic brush.

Figure 6.7 Development

Transfer

A sheet of paper or substrate passes between the drum and a transfer charge roller that has a high positive voltage applied to it (see Figure 6.8). The negatively charged toner of the developed latent image on the drum is attracted to the more positive transfer roller and adheres to the sheet in-between. The charge applied to the back of the sheet causes the paper to cling to the drum. A high negative voltage is applied to a discharge plate immediately after the transfer charge roller to aid in the separation of the sheet from the drum. The curvature of the drum along with the weight and rigidity of the sheet also aid in the separation.

Figure 6.8 Transfer

A more advanced method of transfer utilizes an intermediate transfer belt system. This is most common on colour digital presses where four or more colours are transferred onto the belt before transferring the complete image onto the sheet. Charge rollers beneath the belt, under each drum, pull off the developed **latent images** of each separation directly onto the belt. In the transfer stage, a transfer charge roller beneath the belt applies a negative charge to push the toner onto the sheet. A second roller, directly beneath the first on the other side of the belt, applies pressure keeping the paper in contact with the belt and aiding in transfer for more textured stocks. The lower roller may have a small positive charge applied to it or may be grounded. Some systems can also alternate the charge applied to the transfer charge roller to further aid toner application onto textured substrates.

After this stage, the sheet moves on to fusing where the toner permanently adheres to the substrate. The next two stages described below are post-imaging steps that are necessary to prepare the drum surface for the next print cycle.

Cleaning

After the transfer stage, some toner may be left behind on the surface of the drum. If left there, the background of each successive print would slowly become darker and dirtier. To prevent this, a cleaning blade removes any residual toner from the drum's surface (see Figure 6.9). Some systems will recycle this toner back to the developing unit, but mostly the waste toner is collected in a container for disposal.

Figure 6.9 Cleaning

Erasing

In this stage, an LED array exposes the length of the drum, bringing this area of the drum to near zero volts. This prepares the drum surface for the charging stage of the next print cycle.

Fusing

This is the final stage in the electrophotographic process. The fusing mechanism, or *fuser*, consists of a heat roller, a pressure roller, and cleaning mechanism (see Figure 6.10). Toner is composed mostly of resin. When the toner is heated by the heat roller and pressure applied by the complement pressure roller, it melts and is pressed into the fibres of the sheet. The toner is never absorbed by the paper or substrate but rather is bonded to the surface. A negative charge is applied to the heat roller or belt to prevent the toner from being attracted to it and the cleaning section removes any toner or other contaminants that may have remained on the heat roller. Heat may also be applied to the pressure roller (at a much lower temperature) to prevent the sheet from curling.

Fuser

1	Fusing Belt	4	Cleaning Belt
2	Hot Roller	5	Lower Heater
3	Pressure Roller	6	Upper Heaters

Figure 6.10 Fusing

Along with the transfer stage, fusing can be greatly affected by the paper or substrate used. The thicker and heavier the sheet, the more heat it absorbs. Because of this, these sheets require higher temperatures so there is sufficient heat remaining to melt the toner. Insufficient heat can cause the toner to scratch off easily or not bond at all. Too much heat can cause moisture in the substrate to evaporate quickly and get trapped beneath the toner causing tiny bubbles that prevent the toner from sticking wherever they occur. This issue is seen more on thinner stocks that do not absorb as much heat. Too much heat can also cause toner residue to stick to the heater roller and deposit it on subsequent sheets.

The heat roller can heat up quite quickly but may take much longer to cool down. This can cause delays in producing work that switches between different paper weights. To combat this, some devices use a thin belt that can be both heated and cooled quickly in place of the heater roller. In some cases, a cooling mechanism is also employed further mitigating the cooling lag.

6.5 Paper Basics

Roberto Medeiros

When talking about substrates used in printing, paper is usually what comes to mind. Paper is made most commonly from wood fibre. Today, many papers also have some percentage of recycled fibre as well as fillers and other additives. These all contribute to the quality of the paper itself and to the quality of the printed output. It's important to understand some basic attributes of paper as they all have a direct impact on imaging processes and results.

Formation

Formation refers to the distribution of fibres, fillers, and additives in paper and how evenly they come together. When you hold a sheet up to a strong light source and look through it, the mix of dark and light areas are the result of formation. The more uniform the formation, the less mottling is observed in the paper. Papers with uniform formation accept inks and toners more evenly, have reduced print mottling, and enhance clarity.

Opacity

In strict terms, opacity is the degree to which light is prevented from travelling through a paper. In practical terms, it's how well a paper prevents the image on the backside of a sheet showing through to the front. This is measured on a scale from 1 to 100, where 100 is completely opaque. **Opacity** can be increased with fillers, pigments, or even coatings. In general, a thicker paper, coloured paper, or coated paper is more opaque than its counterparts. Opacity values are very important when projects require thinner paper stocks and both sides of the sheet are being printed.

Basis Weight and Grammage

When looking at the label on a ream of paper used in North America, you usually see two weight designations: the **basis weight**, designated in pounds (#) and the equivalent **grammage**, in grams per square metre (g/m^2 or gsm). In most of the world, grammage is primarily used. In North America, the basis weight is more common. Grammage is simply how many grams per square metre paper weighs. No other factors are represented by this designation. So we can deduce that the higher the grammage, the thicker or denser the sheet. Basis weight is the weight of 500 sheets of paper at a specific size, known as the 'parent' sheet size, which varies based on the historical use of the specific paper. To understand this better, let's examine two different basis weights.

Cover basis weight is based on a 20" x 26" parent sheet. So 500 sheets of 80# cover (the # symbol is used to indicate pounds) at the parent sheet size weighs 80 pounds. Likewise, 500 sheets of 80# text at the text-weight parent sheet size of 25" x 38" also weighs 80 pounds. This can be very confusing as a cut

sheet of letter (8.5" x 11"), 80# text, is much thinner than the same size of 80# cover. Table 6.1 shows common basis weights, parent sheet sizes, and typical uses.

Table 6.1 Paper weights, sizes, and uses

Basis Weight	Parent Sheet Size	Typical Use
Bond	17" x 22"	Historically used as writing paper and typically uncoated. Standard office paper is 20# bond, while colour prints are more commonly done on 24# or 28# bond due to the need for higher opacity.
Cover	20" x 26"	Used for paperback book covers, business cards, post cards. Business cards have typically been 100# cover, but have been trending toward higher weights of 110# and 120#.
Text	25" x 38"	Used for magazines and posters. Relatively thin sheets with higher opacity. Magazines typically use a coated text weight paper for both the cover and the body. Typical weights are 70# to 100#.
Index	25.5" x 30.5"	Used for index cards and tab stock. Tab stocks are typically uncoated 90# index.

Although basis weight is used as the primary weight on a paper label and description, a digital press will typically use grammage to define the weight property when assigning a paper to a tray. Paper weight is one of the key characteristics that affect many parameters on the digital press, including how much vacuum strength is used for feeding, how much charge is required to transfer toner to paper, and how much heat is required to maintain a consistent fusing temperature to bond toner to the paper, among others. Entering the wrong values for the paper weight can cause paper misfeeds, poor image quality, or toner not adhering to the paper. Using grammage simplifies data entry and avoids errors due to incorrect basis weight selection for the numeric weight value. It may, however, require one to do a conversion calculation if only basis weight is provided. The following conversion factors can be used to do these calculations.

Conversion Factors:

Bond (lbs.) x 3.7606 = gsm

Cover (lbs.) x 2.7048 = gsm

Text (lbs.) x 1.4805 = gsm

Index (lbs.) x 1.8753 = gsm

Grain Direction

In the paper manufacturing process, a slurry of fibre travels over a high-speed mesh conveyor belt that is oscillating side to side. This action and movement causes the fibres to interlace and develop a predominant alignment along the direction of movement. This predominant alignment of the fibres is called **grain direction**. Short grain refers to fibres running parallel to the short dimension of the sheet, and, conversely, long grain refers to fibres running parallel to the long dimension of the sheet.

It is important to keep grain direction in mind when choosing a paper for a project. You need to consider the print process and binding or finishing method you will use, as choosing the wrong grain direction can produce poor results or may be incompatible with the printing method you have chosen. Sheet fed offset lithography papers are often long grain and are most common. Digital presses require the grain to run perpendicular to the feed direction in order to feed properly and make the sharp turns typically found in a digital press. In this case, most sheets are fed into the press with the short edge first therefore requiring short grain paper. When folding is required, folds that run parallel to the grain will be smooth and sharp while folds that run across the grain will be ragged, and the fibres on the top of the sheet may pull apart. Toner used in digital printing bonds to the surface of the paper and does not penetrate. Folding across the grain will cause the toner to break apart where the fibres separate.

The second or underlined dimension of the sheet will indicate the direction of the grain. For example, 18" x 12" is a short grain sheet, and 12" x 18" is long grain. If the underline method is used, short grain would be 12" x 18" and long grain would be 12" x 18". If the dimensions are not noted or the sheet is not in its original packaging, grain direction can be determined by folding the sheet along both dimensions. As noted previously, a fold that runs parallel to the grain will be smooth and sharp while a fold that runs across the grain will be ragged. You can also gently bend the paper in either direction. The bend running in the direction offering the least resistance is the grain direction.

Caliper

Caliper, unlike grammage and basis weight, is a measure of thickness. The most common measurement used in North America is thousandths of an inch, designated as points (common for paper) or mils (common for synthetic paper). This terminology can be confusing, however, as points can also refer to 1/72 of an inch when referring to font size, line thickness, and dimensions on a page. Mils can be confused with millimetres as well. A common misconception is that points and mils can be converted to grammage or basis weight. This is not true. The caliper can vary depending on the coatings or finish. In general, a rougher finished stock will have a higher caliper than the same weight of a smooth stock. Coatings can be heavier than paper fibre so coated paper can have a smaller caliper than the same weight of an uncoated counterpart. A process called calendaring, which irons the paper between two highly polished chrome rollers, improves smoothness and printability but also reduces the caliper without changing the weight of the paper.

Brightness and Whiteness

Brightness and **whiteness** define the optical properties of paper and differ mainly in how they are measured. Whiteness measures the reflective properties of the paper across the entire visible spectrum of light (defined by CIE). In other words, it defines how white the paper is. A perfect reflecting, non-fluorescent white material measures 100 whiteness. Brightness also measures the reflective properties of paper, on a scale of 1 to 100, but specifically in the blue area of the spectrum at a principal wavelength of 457 nanometres and 44 nanometres wide (defined by TAPPI and ISO standards). This wavelength coincides with lignin absorption. Lignin is what binds the cellulose fibres in wood and pulp and gives it its initial dark brown colour. The more bleaching done to the pulp, the more lignin is removed, and the higher the blue reflectance and therefore brightness. In most parts of the world, paper whiteness

measurement is used; however, in North America, most papers use brightness measurement instead. Some papers have brightness values that exceed 100. This is due to the addition of fluorescent whitening agents (FWAs), which return additional blue light when exposed to UV light. The same is true for whiteness, as papers with higher blue reflectance levels tend to have higher whiteness levels.

Finish

Finish defines the look and feel of the paper's surface and can be achieved during the paper-making process (on-machine) or after (off-machine). On-machine finishes are achieved by the application of a pattern onto the paper by a marking roller while it is still wet. Examples of on-machine finishes are smooth, vellum, laid and felt (see Table 6.2). Off-machine finishes are accomplished with rollers that press the pattern into the paper after it has been made. Off-machine finishes are also known as embossed finishes. Linen, stipple, and canvas are examples of these; Table 6.3 gives a description of each.

Table 6.2 On-machine finishes

On-machine Finishes	Description	Typical Uses
Smooth	Paper is passed through various calendaring rollers, producing a finish that is uniform, flat, and smooth to the touch.	Ideal for general digital printing and copying as toner is applied to the surface and does not penetrate the fibres.
Vellum	A consistent eggshell appearance that is not quite as smooth as smooth finish but has a velvety feel. Not to be confused with the substrate called vellum, which is translucent.	Used most commonly for book paper.
Laid	Consists of a series of wide-spaced lines (chain lines) and more narrowly spaced lines (laid lines), which are at 90 degrees to the chain lines.	Used for letterhead, reports, presentations.
Felt	A felt-covered roller is used to produce this finish. The appearance resembles that of felt.	Used for letterhead, reports, presentations.

Table 6.3 Off-machine finishes

Off-machine Finishes	Description	Typical Uses
Linen	A cross-hatch pattern resembling linen fabric.	Used for personal stationery, letterhead, fine-dining menus, business cards.
Stipple	A fine bump texture that resembles the painted surface of a wall.	Used where a subtle uneven texture is desired.
Canvas	Simulates the surface of canvas.	Used for art prints or where a 'painted' appearance is desired.

Coated papers have calcium carbonate or china clay applied to their surface. The coating fills in the spaces between the fibres on the paper's surface, resulting in a smoother finish. The amount of coating and calendaring produces different finishes and gloss appearance. Examples of coated finishes are matte, dull, satin, silk, and gloss, described in Table 6.4.

Table 6.4 Coated finishes

Coated Finish	Description	Gloss Level
Matte	Roughest surface of coated paper. Very flat, no lustre, no glare, no calendaring applied.	None
Dull	Smoother surface than matte. No luster, no glare, minimal calendaring.	Very low
Satin	Smooth and soft to the touch. Slight lustre, low glare, light calendaring.	Medium low
Silk	Smooth and silky to the touch. Low lustre, low glare, light calendaring.	Moderate
Gloss	Smooth and slick. Shiny, high calendaring.	High

Cast coated paper has a very high gloss finish on the front side and is uncoated and rough on the back. The high gloss finish is created by applying a heated chrome roller to the coated surface to quickly dry it while moisture is released through the uncoated back of the sheet. Calendaring is not used, allowing the back surface to be rough and ideally suited for labels. Cast coated paper holds ink well, but the toner used in digital printing may not adhere to it.

6.6 Page Description Languages

Roberto Medeiros

Many page description languages (PDL) exist today; however, Printer Command Language (PCL) and PostScript are the most common and widely adopted. Each has its strengths, weaknesses, and jobs for which it is best suited. It is important to understand these differences and choose the method best suited to your particular printing requirements.

PCL

PCL is a page description language developed by Hewlett-Packard (HP) and was originally used on HP impact and inkjet printers. PCL 3 was the first version to be used with a laser printer, the HP LaserJet, released in 1984, around the same time PostScript was introduced. The goal of PCL was to have an efficient printer control language that could be implemented consistently across HP's printer line. Simple commands and functionality would not require expensive print controllers, making it very attractive for utility-level printing. Many other printer manufacturers implemented PCL for this reason. Commands are embedded at the beginning of the print job and set the parameters for the printer to use for the job. These commands remain set until a new value is assigned for the command or the printer is reset. If the printer does not support a specific command, it ignores it.

When colour laser printing became available, PCL 5c was developed with similar goals. New commands were added to the existing command set, as was the case with all the predecessors, to add support for colour printing. This ensured backwards compatibility while minimizing development. When it came to colour, HP's goal was to have colour on the printed page look the same as what was displayed on screen. There were many challenges to achieving this, so print quality adjustments were included to give users the ability to fine-tune the output. With the emergence and widespread adoption of the sRGB standard to define and describe colour on a display, the PCL colour command set could be simplified by adopting this standard for colour printing. Thus, HP's goal could be achieved without the complexity and overhead of a full colour management system. Operating systems and applications, for the most part, have standardized how they display colour in sRGB, so this approach is the simplest way to achieve acceptable colour between display and print. PCL is most appropriate for general office use where a simple, low-cost print device that produces good quality colour is expected. It is not suitable, however, for a colour critical or print production environment where precision and full colour management is required.

PostScript

PostScript is a page description and programming language developed by Adobe that describes text, graphics, and images, and their placement on a page, independent of the intended output destination. The code created is in plain text that can be written and examined with a basic text editor. The output itself can either be to a printer, display, or other device possessing a PostScript interpreter, making it

a device independent language. The interpreter processes the PostScript instructions to create a raster image the device can render. The interpreter is often referred to as a RIP or raster image processor for this reason. It is possible to write valid PostScript code from scratch, but it is impractical as page composition applications can either generate the PostScript code directly or can utilize a print driver, which can convert the page to the PostScript language.

Since PostScript is a general-purpose programming language, it includes many elements that you wouldn't associate specifically with printing such as data types (numbers, arrays, and strings) and control primitives (conditionals, loops, and procedures). It also has an interesting feature called *dictionary*, which stores information in a table consisting of a collection of key and value pairs. The values can be entered into the dictionary while the keys are used to reference the information needed. These features made possible documents that acted like an application which could generate pages dynamically from data directly on the printer itself. These printer-based applications were stored temporarily in memory or permanently in the printer's hard drive, and triggered by a command in the print stream. These capabilities made variable data printing possible using PostScript and are still being used today for that purpose.

The first printer to use PostScript was the Apple LaserWriter in 1985. The same day that Apple announced the LaserWriter, Aldus Corporation announced PageMaker, a page layout application developed to take advantage of the Apple Macintosh computer's GUI (graphical user interface) and the PostScript PDL. This series of events is considered by many as the genesis of the desktop publishing revolution. In fact, the term *desktop publishing* is attributed to the founder of Aldus Corporation.

PDF

Portable document format (PDF) is one of the most popular file formats for displaying and printing documents. When this format was released by Adobe in 1993, it shared many of the same concepts and components of PostScript. But where PostScript was designed primarily to provide device independent consistency in print output, PDF was focused on maintaining the visual appearance of a document onscreen, independent of the operating system displaying it. Over the years, PDF has expanded to more specific-use specifications for engineering, archiving, health care, universal access, and printing.

PDF/X is a branch of PDF and an ISO standard that deals specifically with print. It was developed by the Committee for Graphic Arts Technologies Standards (CGATS). Table 6.5 shows the evolution of the standard.

Table 6.5 Evolution of PDF
Data source: Adobe Systems Inc, 2008, p. 4

Preset	Compatibility	Settings	Usage
PDF/X-1a: 2001	Acrobat 4/PDF 1.3	<ul style="list-style-type: none"> • Convert RGB colour to CMYK (spot colors allowed) • Transparency flattened 	PDF/X-1a ensures that the files are ready for print production—fonts are embedded, colours must be CMYK or spot, layers and transparency are flattened. Note that there is no minimum resolution required for PDF/X.
PDF/X-1a: 2003	Acrobat 5/PDF 1.4		
PDF/X-3: 2002	Acrobat 4/PDF 1.3	<ul style="list-style-type: none"> • Leave RGB and CIELab color unchanged (profiles allowed) • Transparency flattened 	PDF/X-3 has all the benefits of PDF/X-1a plus it allows colour-managed workflows.
PDF/X-3: 2003	Acrobat 5/PDF 1.4		
PDF/X-4: 2008	Acrobat 7/PDF 1.6	<ul style="list-style-type: none"> • Leave RGB and CIELab colour unchanged (profiles allowed) • Live (unflattened) transparency • Layers allowed 	Has all the benefits of PDF/X-3 plus it allows live (unflattened) transparency and layers for versioning. Print workflows based on the Adobe PDF Print Engine will be able to process PDF/X-4 jobs natively, without flattening artwork or converting to PostScript.
PDF/X-4p: 2008	Acrobat 7/PDF 1.6		Use PDF/X-4p when a required ICC profile is unambiguously identified and supplied separately.

Submitting documents for print using one of these standards is highly recommended as it eliminates many of the causes of print issues and is a more reliable method for graphics file exchange.

Digital Front End

Digital front end (DFE) describes the combination of hardware and software that drives and manages a print device. Hardware is often custom built for this specific purpose and may have proprietary video interfaces that connect directly to the print engine. An operating system serves as the base for the software components of the DFE and is often Microsoft Windows based or a Linux or Unix variant. Although the Windows running on a DFE is much the same as its desktop counterpart, Linux- and Unix-based systems are often custom distributions that are compiled specifically for the DFE.

One of the key components of a DFE is the raster image processor (RIP). The RIP refers to the software component that interprets the PDL and performs the function of rendering or rasterizing the complete instructions into an image or raster the print engine will reproduce. The term RIP is often used interchangeably with DFE. This may have been accurate in the past when a DFE really only performed the ripping function and little else. Modern DFEs, however, do much more. In fact, a DFE may contain

multiple RIPs, and within those RIPs they can utilize the multi-threading and processing power of modern computer hardware and operating systems to process many pages or channels simultaneously. PostScript has been the defacto PDL in digital printing for many years but with the development of the PDF/X print standards and the subsequent release of the Adobe PDF Print Engine (APPE), a native PDF RIP, many DFEs now include both PostScript and APPE as their available RIP engines.

ICC-based colour management workflow may be part of the RIP process or can be an independent component of the DFE. Different elements within a print file get processed through their respective channels in the colour management system. Common channels include CMYK, RGB, black, and named colours. The idea is to convert all colour elements into the colour gamut of the print engine's colorants/paper combination. The conversion process can be complicated, but the basic concept is device dependent source colour spaces (CMYK, RGB, etc.) are converted to a device independent colour space, referred to the profile conversion space (PSC), then from the PSC to the output gamut defined in the output ICC profile. The idea is to take the source 'recipe' and define the visual appearance of it first. That is why it needs to convert to device independent colour space, which defines the visual appearance of colour. Once the visual appearance is defined, the 'recipe' for the specific output can be calculated.

Systems that support named or spot colour rendering follow a similar process. The named colour is located in a look up table. The name must match perfectly, including punctuation, spaces, and case. Each named colour is defined in a device independent colour space, typically Lab. There is no calculation in this step. The last step is the same; Lab values are then converted via the output profile.

There is one more calculation applied before passing the information through to the printer. Electrophotography is affected by rapid changes in humidity and temperature. The electrophotographic process relies on components that do become less effective over time and use. These factors all affect the colour output. Calibration should be performed on a regular basis to compensate for these variables. Calibration is a process of creating a correction curve to maintain consistent and repeatable print output. This correction curve is applied right after the conversion to output profile, ensuring output is consistent with what was defined in the output profile itself.

In order to maintain all these aspects of the DFE, an intuitive and user-friendly interface is critical. The user interface includes many components. Here is where you would configure the DFE, find the status of the print device and consumables, view and process jobs and job queues, and examine and export job histories and logs. Many WYSIWYG tools are accessed via the user interface, such as those for workflow, imposition, complex job composition, paper libraries, spot colour refinement, the launching of external tools, and even interfaces into other systems such as web2print. DFEs are becoming more powerful and perform more than just the traditional RIP functions. As the digital print industry continues to evolve, DFEs will be called on to perform more duties and functions. User interfaces will need to evolve as well to maintain usability and stay intuitive.

6.7 Variable Data Printing

Roberto Medeiros

Variable data printing, or VDP, refers to a special form of digital printing where document content is determined by entries in a record or data set and can be highly personalized. Varied text, graphics, and images are typical content elements, but layout, element positioning, and even document choice are just some of the other variables. Because the content on the printed page is constantly changing, it would not be feasible to produce this type of print product with traditional offset lithography or with any other process that requires a fixed image plate. Electrophotographic and ink jet printing are ideally suited for this type of printing as each page is imaged individually.

VDP can take many forms. Transactional documents like invoices and statements are probably the oldest form of VDP, but these have evolved to include marketing or informational content. This is known as trans-promo or **trans-promotional**. A mail merge is a simple form of VDP where a static document has data elements added directly to it. Each record in the data set produces one document. Another VDP form is when you enter the record manually or upload a simple text-based data table, which then fills the content of a template. This method is typically found in web2print solutions and produces items such as business cards, where the layout, fonts, and required elements can be predetermined and the content based on the data entered. More advanced VDP solutions may include campaign management tools, workflow management, two-dimensional barcode generation, image-based font technology, and integration into external systems such as databases, email, web2print solutions, data cleansing, or postal optimization solutions.

One of the core purposes of VDP is to increase response rate and, ultimately, conversions to the desired outcome. In order to accomplish this, it is critical that the content presented is relevant and has value for the intended audience. Today, there are massive amounts of data available on customers and their behaviour. Analyzing and understanding customer data is essential to maintaining a high degree of relevancy and engagement with the customer.

VDP can be broken down into six key components: data, content, business rules, layout, software, and output method. Each component can vary in complexity and capability and may require advanced software solutions to implement. However, even the most basic tools can produce highly effective communications.

Data

Data used for VDP can be simply thought of as a table or data set. Each row in the table is considered a single record. The columns are the fields used to describe the contents of the record. Some examples of columns or fields would be first name, last name, address, city, and so on. The simplest and most common form of representing this table is by using a delimited plain text format like comma separated value (CSV) or tab delimited. The *delimiter* separates the columns from one another and a new line represents a new row or record in the table. Here is an example of CSV data:

"FirstName","LastName","Gender","Age","FavQuotes"

"John","Smith","M","47","Do or do not, there is no try."

"Mary","Jones","F","25","Grey is my favourite colour."

The first row contains the row headers or what the fields represent and is not considered a record. You'll notice that each field is separated by a comma but is also enclosed within quotes. The quotes are text qualifiers and are commonly used to prevent issues when the delimiting character may also be in the contents of the field as is the case with the first record above. Many VDP applications support more advanced, relational databases like SQL, but a query must be performed to extract the data to be used, which ultimately results in the same row and column record structure. The data must be attached or assigned to the document in the page layout or VDP application.

Content

Content refers to elements displayed on each page. This would include text, graphics, and images, both static and dynamic. Dynamic content uses placeholders, typically named by the column headers of the data, to mark the position of the element and reference the data in the specific column of the current record. When the document is rendered, the placeholder is replaced by the record data element.

"Dear <<FirstName>>..." becomes "Dear John..." when the document is rendered for the first record and "Dear Mary..." for the second record, and so on. A complete document is rendered per record in the dataset.

Business Rules

Business rules are one of the key elements that make VDP documents highly useful. They can be thought of as a series of criteria that are checked against the data to determine what gets displayed on the page. They can also be used to manipulate the data or filter out relevant content. In almost every case, some level of scripting is required. Advanced VDP solutions have built-in scripting capability, utilizing either common scripting language such as VBScript or JavaScript, or a proprietary scripting language that is only applicable in that specific application. If the page layout tool you are using to create your VDP document does not have scripting capability, you can apply business rules to data beforehand in a spreadsheet application like Microsoft Excel or even Google Sheets.

K	L	M	N	O
oneNumber	@BG	@Plane		
7-8192	=IF(
0-8369	IF(logical_test, [value_if_true], [value_if_false])			
3-3957				
1-9231				
9-1525				

Figure 6.11 Logical test

One of the most common methods for implementing a business rule is using a conditional or IF statement comprising a logical test, an action for a ‘true’ result, and an action for a ‘false’ result (see Figure 6.11).

The logical_test means that the answer will be either true or false. In this case, we want to change our graphics based on gender.

In plain English, you may say:

“IF gender is male, THEN use plane_blue.tif, or ELSE use plane_orange.tif”

In scripting, it would look something like this:

IF(Gender="male","plane_blue.tif","plane_red.tif")

When doing this in a spreadsheet, you would enter the script in a cell in a new column. The result of the script is displayed in the cell, not the script itself. This new column could now be used to specify the content to be displayed in your layout application. In dedicated VDP applications, the script is attached to the object itself and is processed and displayed in real time.

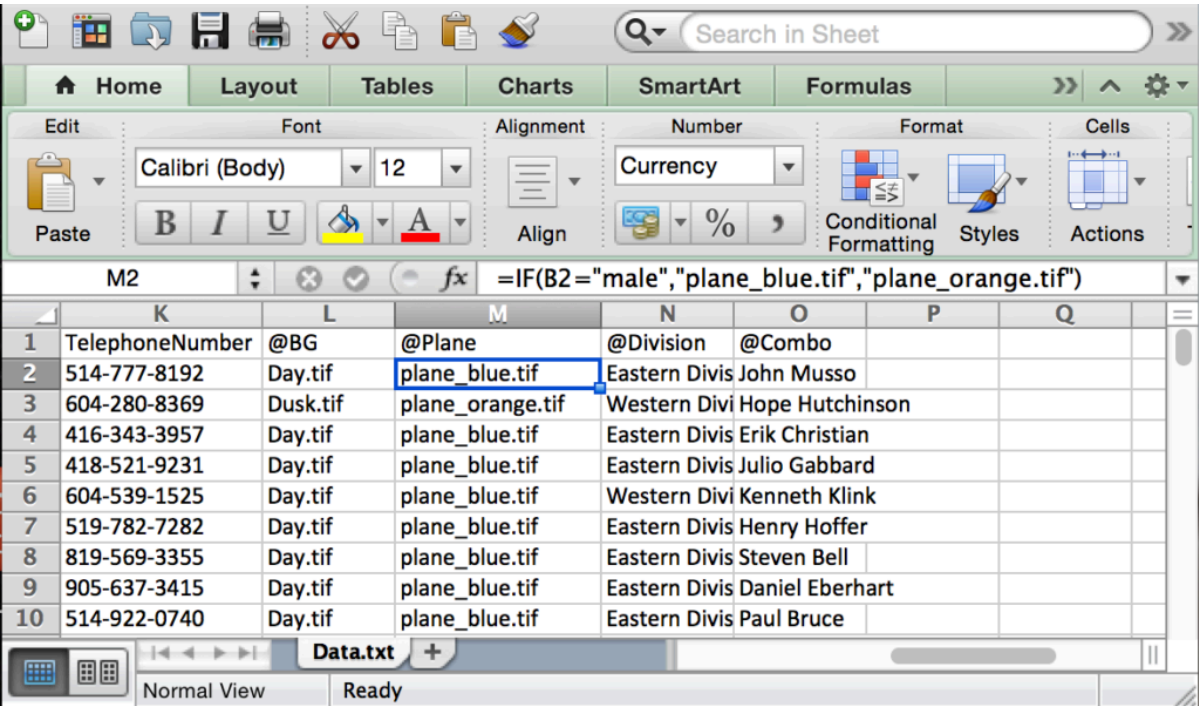

Figure 6.12 Plane blue

The “@Plane” column was added to dynamically change a graphic based on the contents of the cell in the “Gender” column (B2) (see Figure 6.12).

Business rules can also be applied to the VDP workflow. In this case, the workflow application or component can manipulate the data before applying it to a document, or it can select the document or destination to be used for the record and much, much more.

Layout

When working with variable data documents, there are special layout considerations you should be aware of. Because word lengths will change per record, there needs to be sufficient space to accommodate the largest and smallest record, and prevent **oversetting** while maintaining the desired visual appearance. This challenge is compounded by the prolific use of **proportional fonts**. Character widths differ with each letter so word lengths will vary even when the number of characters is the same. This can also force a paragraph to reflow onto another page and change the number of pages in the document. Additional scripting may be required to handle reflow scenarios. Some applications use special copy-fitting algorithms to dynamically fit text into a defined area. The use of tables for layout purposes can also be helpful. Because we are dealing with dynamically generated documents, we may also want to vary the images. Using images with a consistent size and shape make it easier to work with. Transactional documents, such as statements and invoices, extensively use numbers. Most fonts, including proportional ones, keep numbers mono-spaced. In other words, every number character occupies the same amount of space. This is important because, visually, we want numbers to be right justified and lining up vertically in columns with the decimal points aligned. There are, however, some fonts that do not follow this common practice. These fonts may be suitable for use in a paragraph but are not for displaying financial data.

Software

Software that can generate a data-driven document is required for variable data printing. In the early days of VDP, there weren't many choices for designers. It was common practice to hand code VDP in PostScript, since it was both a programming language and a PDL. Applications like PageMaker and Illustrator were PostScript design applications but lacked VDP capabilities. Applications like PlanetPress emerged as dedicated PostScript VDP applications. Today, designers have a wide variety of software available for creating VDP. There are three basic VDP software types: a built-in function within a page layout or word-processing software, a third-party plug-in, or a dedicated VDP application.

Microsoft Word, for example, has a mail merge function but does not have the ability to vary images, just text. Adobe InDesign has the data merge function, which is basically a mail merge but includes the ability to vary images as well. In both these examples, business rules would be applied to the data prior to using it in these applications.

There are a number of plug-ins available for InDesign that are very sophisticated. These leverage the extensive page layout capability of InDesign while adding scripting and other VDP specific capabilities. XMPie and DesignMerge are examples of these types of plug-ins. FusionPro is another plug-in based VDP product, and while it does have an InDesign plug-in, it only uses this to allocate variable text and image boxes in the layout. Business rules and specific content are applied in its complement plug-in for Adobe Acrobat.

PlanetPress and PrintShop Mail are examples of dedicated applications that combine both page layout and VDP functions. Although they are very strong in VDP functionality, they sometimes lack the sophistication you'd find in InDesign when it comes to page layout. These particular applications have recently moved from PostScript-based VDP to a more modern HTML5 and CSS (cascading

style sheets) base, making it easier to produce and distribute data-driven documents for multi-channel communications.

Output Method

The ‘P’ in VDP stands for printing and is the main output method we will discuss here. However, document personalization and data-driven communications have evolved to also include email, fax, web (PURL, personalized landing page), SMS text messaging, and responsive design for various mobile device screen sizes. With the emergence of quick response **(QR) codes**, even printed communications can tap into rich content and add additional value to the piece. In order to take advantage of these additional distribution and communications channels, a workflow component is often employed.

A key element for optimized print output of VDP documents is caching. This is where the printer’s RIP caches or stores repeatable elements in print-ready raster format. This means the RIP processes these repeating elements once, and then reuses these preprocessed elements whenever the document calls for them. This does require a RIP with enough power to process large amounts of data and resources with support for the caching scheme defined in the VDP file but, ultimately, allows the printer to print at its full rated speed without having to wait for raster data from the RIP.

There have been many proprietary VDP file formats that have striven to improve performance of VDP over the years, but the industry is moving rapidly toward more open standards. PODi, a not-for-profit consortium of leading companies in digital printing, is leading the way with two widely adopted open VDP standards. These standards are PPML (Personalized Print Markup Language) and PDF/VT (portable document format/variable transactional).

PPML

PPML, first introduced in 2000, is a device independent **XML**-based printing language. There are two types of PPML: *thin* and *thick*. Thin PPML is a single file, with the .ppml extension, containing all the instructions necessary for producing the VDP document. It does include caching instructions; however, all resources such as fonts or images are stored externally of the file. The path to these resources is defined in the RIP and retrieved during the rendering process of the document. Thin PPML is ideal for in-house VDP development where resources may be shared by multiple projects. These files are extremely small, however, and network speed and bandwidth may affect performance and are more difficult to implement if using an external print provider. Thick PPML is a .zip file containing all the required resources (fonts, images, instructions, etc.). This format makes the file highly portable and easy to implement on the print device, but it has a larger file size when compared to thin PPML. RIPs that support the PPML format can import the .zip file directly. Regardless of the type used, PPML benefits from exceptional performance, an open standard, open job ticketing support (JDF), and overall reduced file size. To generate PPML, an advanced VDP solution is required.

PDF/VT

PDF/VT is a relatively new international standard (ISO 16612-2) that has a lot of potential. It is built off

the PDF/X-4 standard, benefiting from its features, such as support for transparency, ICC-based colour management, extensive metadata support, element caching, preflighting, and much more. In short, PDF/VT includes the mechanisms required to handle VDP jobs in the same manner as static PDF printing allows print providers to use a common workflow for all job types, including VDP. Many of the latest releases of advanced VDP solutions already support PDF/VT as well as many DFE manufacturers.

For more information on PPML and PDF/VT, please refer to the [PODi website](http://www.standards.podi.org) at: <http://www.standards.podi.org>

6.8 Summary

Roberto Medeiros

Digital printing encompasses a number of technologies that each has unique characteristics, strengths, and applications. Digital imaging may even be the only print method able to produce a certain type of work, as is the case with VDP. Paper is also a major factor in the success of a project. Your paper choice can convey a message or set a tone as much as the content printed on it. Having a good understanding of technology and paper fundamentals can go along way when making choices for producing your print project.

Questions to consider after completing this chapter:

1. All xerography can also be called electrophotography, but not all electrophotography can be called xerography. What key element validates this statement?
2. What are the four key components in electrophotography?
3. How does toner acquire its charge?
4. What is the difference between paper brightness and whiteness?
5. Which PDLs support an ICC colour-managed workflow?
6. Which PDF/X standard leaves layers and transparency live?
7. Why are data content and business rules critical in VDP?

Chapter 7. Web2print

7.1 Introduction

Steve Tomljanovic

Learning Objectives

- Describe web2print and how it benefits the supplier-customer relationship
- Differentiate between the different business models of web2print implementation
- Explore the economic impact of implementing web2print
- Research target markets that would benefit from online selling processes
- Define business to business (B2B) and business to consumer (B2C) sales models
- Examine variable templates and identify their components
- Discuss how print on demand works and how it affects the sales cycle
- Give examples of print workflows and management information system (MIS) integration
- Discuss how web2print business opportunities might affect return on investment

As modern modes of communication are constantly changing, the print industry has had to become very competitive. Successful print companies have evolved beyond producing only printed products; today, they also provide other services geared to an electronic marketplace. With the ever-growing number of people going online, customers have adapted to having instant information (Poon & Swatman, 1995), which printers can now provide. One such service is web2print. Customers benefit from the ease of ordering print anywhere around the world, with quicker turnaround times than traditional methods. Print companies benefit by building a larger customer base, streamlining workflows, and reducing production costs — all while staying competitive.

Print has traditionally been a service requiring many human touch-points, but with advances in business communication over the Internet, the dynamics of custom manufacturing are changing, particularly with respect to the ordering process (Shim, Pendyala, Sundaram, & Gao, 2000). Putting an effective online service in place involves strategically selecting suitable products and services. Online ordering is not ideal for every print product, but rather for specific products that are unnecessarily labour intensive. Products that were once very labour intensive, such as business cards, can now be ordered online. Customers enter their information directly into a template on screen while they sit in their own offices. A print-ready PDF file enters an automated folder in the print company (called a hot folder) and moves into the print workflow, allowing for a fully automated process called *lights-out prepress*, which saves on labour and allows for greater profits. Web2print provides a client company a value-added feature, while improving workflow process for the print company.

Technology Is the Key

Web2print completely automates the print ordering process by integrating online orders with print production. Using the Internet automates order entry and provides time savings to both the customer and the company.

Electronic commerce offers the possibility of breakthrough changes: changes that so radically alter customer expectations that they redefine the market or create entirely new markets (Gunasekaran, Marri, McGaughey, & Nebhwani, 2002, p. 195).

This technology allows businesses to interact with customers in a new way in addition to more traditional forms of ordering such as email, file transfer protocol (**FTP**), phone, fax, and face-to-face meetings. While web2print removes the need for more traditional ways of ordering, it does not replace them. Some customers may prefer these ways because they may not know, or be comfortable with, the online options that are increasingly available to them. It is advantageous to a company to inform and educate customers, encouraging them to evolve their buying habits. Traditionally, purchasing involved gaining knowledge about print companies through their sales reps, selecting the appropriate company, and trusting that the sales rep would ensure the product was delivered on time and for the best price. Today, many customers use search engines to obtain information about and decide on which print company to use. Using web2print ensures that the production time frame and the price match what a customer is looking for.

A printing company has to work with and implement many complex and interconnected systems in order to generate a printed product. From the inception of a new item to its delivery to the end-user, there are many opportunities for streamlining. Web2print creates efficiencies at the beginning of the print process, and those benefits trickle all the way through to imaging. The ultimate goal is for the data collected from the customer to proceed directly to the raster image processor (**RIP**) that drives the production process. A print company that takes advantage of this type of automation is positioning itself for smoother and more cost-effective print runs.

7.2 E-commerce for Print Manufacturing

Steve Tomljanovic

E-commerce is by definition the buying and selling of goods online. Print companies are turning to e-commerce to target the ever-growing number of people who want self-service and a more convenient way to purchase products in their busy lives. Today, many customers are online and the number of users purchasing goods through the Internet is growing substantially (Statistics Canada, 2014). The ability to offer an effective e-commerce service for ordering can put a print company ahead of its competitors. This approach challenges traditional thinking that a printer is only a bricks-and-mortar or face-to-face business. As more and more businesses move online to satisfy their customers' procurement needs, so must print companies (Supply Management, 2014).

A print company should transition with its customers to stay ahead of the competition. E-commerce allows a customer to order any product 24/7 without having to leave the office or pick up the phone. Providing online ordering has other benefits besides increased sales. It can help a company gain more knowledge about its customers and track purchasing trends. As well, online ordering allows print companies to offer customers additional products and services that may not come up in discussions during traditional forms of print procurement.

Not all business can be conducted online, as the more complex a project is the more a company will benefit from offering its services and expertise in traditional face-to-face communications. However, the ability to stay ahead of the competition by using Internet technologies helps solidify a company's relationship with its customers. For example, even if customers are buying products offline, they are likely doing their research online first. Therefore, a company can use the valuable data generated during this research to greatly improve its ability to evaluate and manage its business. When customers place orders, companies can analyze the frequency of those orders, their customers' buying trends, and which products are more successful than others. Data-gathering is the most important advantage online ordering has over traditional offline ordering. Using an e-commerce system allows a print company to learn more about what, when, and how customers are ordering. Online technologies enable a company to broaden the products and services it provides more than ever before.

Templated Variable Data Printing

Templated variable data technology allows a customer to produce a product using a template-driven order-entry system. These templates are used most frequently through an e-commerce store. A variable template allows the user to control the information made available on a product and see the real-time end result. Variable data entry is an ideal solution for direct mailers, promotional flyers, event posters, and stationery. Variable data allows for the custom printing of one-of-a-kind pieces that are unique to the targeted market. The potential for variable data is endless and is only limited by the imagination behind a design.

Variable data is not limited to digital presses, as many lithography presses can incorporate designs with

the simple swap of a plate. It is common for companies ordering large quantities of business cards to print blank shells on which they can later imprint a person's information. A print company obtains this information by having the customer use a variable template, which is then uniquely created to ensure all branding standards are consistent. This allows any employee of the client company to order business cards and stay true to the brand. The person fills out his or her name, title, and phone and email contact information, then views the result on a soft-proof. Then the person simply submits the card through a shopping cart system, eliminating the need for multiple communications, and making production efficient by having fewer hands touch the project.

The Benefits to a Print Company

Web2print has multiple benefits for a print company. Software can automate tasks, eliminating the need for staff to touch a project, which makes the service profitable. Allowing the customer to create a print-ready PDF is an asset, not a loss of control, as it allows the customer to assume responsibility for any typos or errors. Web2print also makes the production process much faster and efficient by automating time-consuming steps, and most importantly, helps build solid rapport and customer loyalty.

Once a PDF is ordered, a job ticket (called a *docket*) is automatically generated containing all of the order specifications, including pricing. The PDF then travels to a hot folder where it is accessed by the imposition software, which imposes it onto a press sheet. The press sheet either goes straight to the digital press to be printed or to the plate setter if it is being printed by conventional lithography. The whole process is extremely efficient and takes considerably less time to complete than having staff continually involved as the PDF travels through their departments.

The Benefits to the Customer

Web2print is all about customer satisfaction. That should be the top priority when a print company creates customized online storefronts and variable templates. Customers no longer have to call or physically meet a sales rep, as they now have the ability to order their printed materials at any time of the day and from anywhere. Today, many customers do not sit behind a desk for their entire workday, and establishing an online service allows a company to target those on-the-go customers who need to order print.

Companies can track orders in real time, which helps them predict future buying trends. This is especially beneficial to customers wanting to print blank items, otherwise known as *shells*. Using this information, a company can help a customer determine how many shells to print in the next run.

Business Models: Licensed or Subscribed Software

Web2print services come in two primary types: licensed software and subscribed software. Licensed software allows a print company to own the technology by paying an upfront fee; subscription-based software typically requires a company to pay a monthly or yearly fee to use the software.

Licensed software strategies typically represent a large cash outflow up front. The company can then use

the software to create as many portals or implementations as it wishes. While the software is supported through a licence, it is expected that the company will maintain its own web presence, and therefore may require highly trained web developers or programmers. The outlay of expense is gradually recouped over time through increased user implementation.

The subscription model, also referred to as **SaaS** (software as a service) reduces a company's support and maintenance costs up front. SaaS allows adding new print products to move forward more quickly because the need to support the same version throughout computers internally is removed. All subscribers operate on the same version at the same time, and are upgraded regularly at the same time. Because the Internet is constantly evolving, the SaaS model is flexible and better aligned to move with it. This business model contributes to a company's return on investment (**ROI**) as well. Since a company typically doesn't pay a large sum of money upfront for the software, it can easily budget for payments based on monthly usage. The company only pays for the services it uses. This business model builds a partnership between the print company and its SaaS vendor, and a positive ROI is beneficial to both parties in the partnership because it keeps both vendor and subscriber focused on mutual success.

7.3 Web2print Strategies and Goals

Steve Tomljanovic

Evaluating Strategies and Setting Goals

Print companies must have clear strategies and goals to ensure continued success when implementing web2print. The first step is to evaluate the type of sales they make. There are two basic types of sales a print company makes: business to business (**B2B**) and business to consumer (**B2C**). It is very common for a printing company to serve a primarily B2B customer base; however, since B2C requires a vastly different storefront, this decision needs to be made early in the process of implementing web2print.

Once a print company determines the type of storefront its customers need, it should research the three basic types of service: print on demand (**POD**), variable data printing (**VDP**), and static warehoused items. By analyzing its target market, a print company can determine which of these services customers will use most. Once the print company chooses a software vendor that can provide the most suitable storefront, only then can it decide on the specific services to offer each of its customers.

Therefore, to be successful, a print company must:

- Know the target market
- Choose an appropriate vendor and storefront
- Make plans to add new customers to the system by setting goals
- Choose the types of products to offer to each customer based on need

Know the Target Market

Every print company has a different customer base, and thus serves a different market. A print company must analyze the customers it serves to determine exactly what its target market is. The biggest mistake print companies make when committing to the purchase of an online ordering system is not researching the technology in relation to their target market. Print companies should choose the system that best suits their needs and benefits their customers. There are hundreds of vendors and products with thousands of features, so print companies need a strategy to ensure they can maximize their return on investment (ROI) while providing the best possible services to their specific, targeted customer base.

Choosing a Digital Storefront and Variable Software

Since not all vendors of e-commerce systems are the same, print companies need to exercise due diligence in making their choice of vendor. They should analyze their own internal workflow to ensure they find a vendor that best meets their specific needs. As well, print companies should determine what their employees' strengths are and ensure the appropriate staff are hired to accommodate online needs.

Staff involved in the implementation and operation of an e-commerce ordering system need a basic knowledge of many web-based programming languages in order to give them a good grasp of the back-end coding necessary to build and maintain the online system. Every online ordering system uses its own method of coding to create its storefronts and templates, so having previous programming knowledge is a major asset.

Many companies such as IBM, HP, Creo, and EFI are building platforms to provide VDP service to print companies. The software these companies provide creates a web2print workflow. This includes the internal processes needed to print a job, as well as a client-facing website, from which customers can order. It is important to understand the benefits of every digital storefront as they all offer different options. Digital storefronts must provide a simple ordering process for the customer while being very robust and efficient for the print company. Selecting the order quantity and displaying pricing should be simple and not confusing for the end-user. Customizing VDP products or ordering POD or warehoused items should be simple and quick. The ability to split products for multiple-shipping destinations should also be considered.

Selecting a storefront that can be integrated into a management information system (**MIS**) to streamline orders from customization to invoicing is beneficial. The ability to have customers approve or reject orders placed by others is also beneficial, as it allows for an extra review to ensure order information is correct.

To ensure they make appropriate choices, print companies request copies of documentation from a software provider to see what they need to learn if they plan to be a self-service user of the software. They request references and ask how the software provider handles support, system outages, and upgrade development to get a sense of how other users perceive the company. Print companies attend demonstrations of the product and give specifics on what they want to hear beyond the generic sales pitch. Print companies also seek specific information about short- and long-term product upgrades, which gives them a chance to glimpse the software company's strategic vision and how the product might develop in the future.

Other Considerations Before Purchasing

Print companies take other considerations into account before purchasing software.

Usability: If they have current B2B customers, print companies ask them to test the software before committing to a purchase. If these end-users have difficulty using the software, then it is not the right choice. If print companies have B2C customers, they ask someone without any print knowledge or experience to test the product. Testing against online competitors to see how the software compares is another way print companies assess the usability of a product. They also research customer feedback.

Partnership compatibility: The relationship between a print company and a software provider is a partnership, not just a sales interaction. Print companies are in frequent contact with their software provider to solve technical difficulties, arrange training, or add improved services. Therefore, determining if the software provider will make a compatible partner is important. Print companies don't rely solely on what the sales rep tells them; they try to get a sense of the software provider's team by calling the support desk and talking to customer service. This helps print companies determine how well they will be treated and whether the software provider's staff are knowledgeable.

Features: Assessing software features is usually part of the decision-making process. Print companies generally want to know the following before purchasing:

- How easily will customers understand and use the software's features in a self-service situation?
- Was the software built to support the print industry or first created for some other use and applied to the print industry? If the former, are the features transferable?
- Do the features allow set up and administration of the site, creation of B2B storefronts, and product development. Do they enable the print company to add variable elements, create users, and take orders without relying on the software provider?

An important tip when choosing software technology is to not put too much emphasis on the number of features offered. Features tend to constantly change, and more does not necessarily mean better. While software product development tends to centre on adding more features, it is not necessarily adding more value. If a feature is added to a product, but is never used by customers, it is possible that the feature did nothing more than add complexity to the ordering process. Such a feature may result in discouraging customers from using the system, or placing future orders.

Starting with a New Customer

One way to introduce a new customer to web2print is to build a single item for them. This allows the customer to learn the ordering process and the print company to learn and incorporate the customer's products into a production workflow. A workflow should be designed to be as automated as possible, from order entry to production to invoicing. New workflows should include sufficient time to allow a customer to test the variable templates to extremes, entering best- and worst-case scenarios to ensure the template can perform in all situations without errors. Only once the initial workflow has been proven to be efficient should more products be added to the storefront. This ensures that both the customer (external activity) and the print company (internal activity) are confident enough in the workflow to handle more orders.

Setting Goals and Site Testing

Printing companies should allow time to educate their customers in all steps of the process when launching an e-commerce system or when adding a new variable-template-driven item. The easiest way to meet customer expectations is to involve them in the development process, regularly inviting feedback and eliciting suggestions for improvement. Customer satisfaction is important, so a company must ensure that it takes client feedback seriously, incorporating customer input to improve the service process. As the site is being developed, both the programmer and the customer need to rigorously test new products and templates to ensure they are completely satisfied long before allowing product ordering. It is common for a programmer to envision how a template will behave, while the customer intends it to behave in a different way. Often a customer has expectations that the programmer may not have foreseen. Once the entire site, including products and templates, has been developed, it still isn't ready. A testing phase or pilot period is necessary to find any other bugs or shortcomings that may be more easily discovered once real data is being used. Implementing a pilot period before an official launch

of the full workflow also allows everyone to learn how the system will impact them, exposes potential workflow issues (which can arise in the many steps between ordering and invoicing), and allows the customer to provide final feedback.

Most important to keep in mind is that the system only works when customers use it. They will often find opportunities during the pilot period to suggest where the process can be improved, as unforeseen problems are discovered only after people start using a new system or variable template. Often these user-experience issues can prevent adoption of the system by the customer. As well, customers may fall back to the more familiar method of traditionally ordering print if they do feel comfortable using the new system. Including the customer in the entire process allows for the greatest chance of success, and is the best way to ensure the success of the site.

Choosing the Right Type of Products

Before setting out to create products, a print company should determine whether it is a variable template, a print-on-demand piece, or a warehoused item. Other key information needed is the name of the product and the communication intent (i.e., Is the piece promotional or educational? What audience is it intended to reach? How knowledgeable is this audience?). Print companies also need to know whether the product will be ordered regularly or be a one-time communication. It is important to choose the right products before the development phase begins. It is common for a product to be almost completely programmed before it is discovered that another similar product would have been more appropriate. Below are explanations of the three most common types of products, followed by a list of more specific options.

Variable Templates

Variable templates contain all the necessary information for a customer to customize and soft-proof a print order. This usually results in the creation of an automated, print-ready PDF, which is generated while the customer is still online.

A PDF of the design is created containing variable fields assigned for every element. Coding is then applied to each field to determine how the template will behave under given circumstances, such as during customization. For example, coding can force a name to be upper case or email to be lower case. Coding can also be used to upload custom images or force phone numbers to use hyphens (e.g., 604-123-4567) instead of dots (e.g., 604.123.1234). Coding is critical for keeping a customer's brand consistent, so regardless of who creates an order, all products will be formatted consistently and have the same look.

Deciding which VDP software or plug-in is more appropriate and how it interacts with the digital storefront is important. VDP software comes in the form of third-party applications such as XMPie or is accessed online through a self-hosted dashboard.

Print on Demand

POD products are the opposite of VDP products. POD allows the customer to order a static product to

be printed and shipped. POD products do not require customization and are printed using a completed file uploaded by the customer or stored in the system by the programmer.

Warehousing

Storefronts can act as an inventory management system for any products that can be warehoused. These products can be ordered online using the same process as a POD item. Each product has a real-time inventory count associated with it, which updates after every order. Notifications can be sent about low product inventory levels, reminding a customer that a product needs to be replenished. Inventory counts benefit customers by showing their buying patterns, which helps them to effectively determine future quantities.

Below are other examples of different types of products that can be ordered online:

- *Ad hoc print*: an online print product where the customer provides the content during the ordering process via file upload, such as brochures, flyers, and newsletters.
- *Ad hoc business documents*: an online print product where the customer provides the content during the ordering process via file upload, such as training manuals, presentations, and reports.
- *Ad hoc oversize*: An online print product where the customer provides the content during the ordering process via file upload, such as posters, signs, and banners.
- *Static print product*: An online print product where the content is stored in a catalogue and printed on demand after ordering, such as sales sheets, flyers, and white papers.
- *Inventory product*: An online print product where the content is stored in a catalogue and pulled from existing inventory after ordering.
- *Digital publishing*: An online product where the final product is a downloadable PDF instead of a printed product, such as white papers, personalized sales materials, and presentations.
- *Kit*: An online print product where the customer can buy a basket of goods contained in a single item.
- *Promo product*: A set of products that are branded with a logo for use in marketing or promotional programs, such as mugs, baseball hats, and pens.
- *Integrated campaign*: A product that combines multiple-marketing channels to create an integrated campaign a customer can use to track metrics when launching a new product or sales promotion.
- *Photo product*: An online print product using uploaded photos or photos from online collections, such as photo books, photo cards, and photo calendars.
- *Quote request*: An online print product used to request a quote for a print job.

7.4 Implementation and Workflow Considerations

Steve Tomljanovic

Implementation and Deployment

By this point, the workflow strategy has been created, the customer has been included in discussions about its goals, and the print company has created some sample products and print items for the customer to test. As well, the print company and customer have completed a pilot period and identified unforeseen workflow issues. What remains is the final step of making the site live.

Making the site live involves ‘turning it on’ to accept orders from the entire user base. If the above steps have been completed properly, there should be very few issues.

Continuous Assessment

Even after a storefront has been launched, it is not considered complete. There should always be a system of continuous assessment in place to respond to customer feedback and correct any errors as the orders start coming in. Even after the site is live, the programmer should navigate the storefront to ensure its usability, and place a test order to ensure no issues arise for the customer during the ordering process. Also of consideration is a post-order assessment, where the internal processes in the printing company are evaluated for completeness and efficiency, as outlined below.

Workflows and Automation

Orders should enter an automated workflow, creating a seamless transition while bypassing several departments. Once an order has been placed, the appropriate staff are notified to fulfill it. If a VDP product was customized, then a print-ready PDF should automatically be uploaded to a hot folder. At this point, either an automated system or a prepress operator reviews the file for print standards and imposes it on the print template. These files can then be automatically produced on a digital press or be sent to the plate setter to be prepared for litho printing. Throughout every step of the process, email notifications should be sent to appropriate staff so they can fulfill the order, and to the customer so they can be kept informed of anything related to the order such as invoices and product shipping.

MIS Integration

It is beneficial to select a storefront suitable for integration into a management information system (MIS) to streamline orders from customization to invoice. Integration is a connection between two systems that enables the exchange of data. The information is automatically entered into an electronic docket, which is a database that collects and maintains customer information, products ordered, shipping

information, and billing information automatically. When integrating two systems, it is important to note which system is the master data holder and which is the subscriber to that data. Only one digital system should ‘hold’ the data, whereas all the other systems access the same database. In a print environment with a functioning print MIS system, it is the MIS system that should be considered to be the master in every case. The MIS system collects orders from everywhere, not just the orders placed through storefronts online. The web2print system pushes data into the MIS system and subscribes to the master data stored and managed in that system, such as pricing and job specifications. This can be challenging because the web2print software and the print MIS system are often provided by separate vendors, which can prevent a smooth exchange of data.

Web2print is one of many secondary, or subscriber, connections into a printer’s business and production workflow. Web2print should serve its main purpose, which is to capture orders in the most efficient manner while maintaining a competitive edge for a print company’s sales team. Orders must be transitioned seamlessly and smoothly into the production workflow and MIS system so they can be treated like any other order, whether they were placed online or by traditional means. In this way, web2print is regarded as only one of many business opportunities that bring sales to a print company.

Analyzing the ROI

When making any business decision, investment must be weighed against return. This is known as return on investment, or ROI. Moving a business online to accept orders is a serious business decision. Web2print can be a worthwhile investment and understanding how to measure ROI before investing in a vendor’s software is important.

Typically, in a print company, the estimate for the actual printing process is very well defined. The estimating department can provide detailed analysis of all of the costs associated with printing a specific printed product. Where web2print differs, however, is in the costs of capturing the sale and in streamlining the process in the print shop. For example, there are specific increased costs in running a web2print site online. If the system was paid for as a one-time licence, then the total cost must be amortized over the life of the licence, and each print order shares a small part of that overall cost. Some SaaS systems, on the other hand, charge a piece rate or a monthly fee. These are easier to incorporate into the costs of the job. On the savings side, there are processes within the print company that are made more efficient, so an analysis of cost savings can be made there as well. However, print companies should not fall into the trap of thinking that just because a print job can be completed in a shorter time, it is automatically cheaper to produce. In order to assess the total ROI, only real costs that affect the print product’s profitability should be assessed.

Timing is important when calculating ROI because a printer must determine when to invest money based on an expected return of that investment. Purchasing or building an online system is not automatically going to generate revenue. It is likely that the print company could invest thousands of dollars very quickly before the system provides any value in return. There is a human aspect to this as well. Sales professionals are still critical for driving new customer sales to the web and finding new online opportunities, both of which will help improve the return on the initial investment.

Systems with monthly payments are sometimes better for new online ventures, as they do not require a huge investment upfront. Up-front payments force a print company to give away all monetary leverage

in a single transaction, and while they might be more cost-effective when serving large numbers of customers, they can do serious financial damage in the short term.

7.5 Summary

Steve Tomljanovic

Web2print is the online connection between a print company and its customers, and the technology should help to solidify this relationship, not hinder it. Print companies offer their services online in response to their customers' needs and buying trends. As web2print becomes more integrated into a print company's day-to-day business, it becomes a main channel for interacting with a customer. A key to the strategy for implementing web services is involving the customer as much as possible, since the customer's use and acceptance of the ordering portal is critical for its success. Print companies should research the types of products and services that will be helpful to customers in the specific target markets they serve, and not add too many products too quickly. Print companies must analyze the types of products their customer needs, and plan how a streamlined workflow will create efficiencies in its operations. Finally, a pilot phase to assess both accuracy of the storefront and user experience is important. To ensure continued customer satisfaction, print companies should be prepared to make ongoing improvements once the site goes live. System integration with print companies' internal processes is also ongoing, as efficiencies and production enhancements are realized. The print industry continues to evolve and a successful implementation of a web2print portal will help print companies keep up with this evolution and stay in front of the competition.

Questions to consider after completing this chapter:

1. How would you describe web2print and the technology involved?
2. How would you describe e-commerce and how web2print utilizes it?
3. What are the benefits of using web2print to a company and its customers?
4. What are the strategic steps in creating a web2print system?
5. What types of products can be offered through a web2print system?
6. In what ways can a web2print system be integrated into a production workflow?

Glossary

About the Authors

The Graphic Communications Open Textbook Collective comprises the following authors.

Wayne Collins

Wayne Collins completed his Bachelor of Arts in English Language Studies at the University of Regina while concurrently completing a traditional five-year trades apprenticeship in pre-press with the Graphic Arts Union. He moved to Vancouver in 1985 and worked at Zenith Graphics, first as a film stripper and camera operator, and later as a computer systems operator and manager. He moved to Creo in their formative years and helped champion their computer to plate systems across North America. Before starting the Graphic Communications Diploma Program at British Columbia Institute of Technology in 2006, Wayne managed the pre-press department at Hemlock Printers in Vancouver for 15 years.

Alex Hass

Alex Hass is a multidisciplinary designer, illustrator, and artist. Her design practice encompasses art direction, typeface design, and image creation. She has a special fondness for book design. She has partnered with Canadian publishers, art galleries, artists, universities, furniture makers, filmmakers, First Nation educators and historians, musicians, the CBC and the National Film Board in her design projects. Alex studied illustration and art direction at the Alberta College of Art and Design, received her design degree in visual communication from Nova Scotia College of Art and Design University, and her Master's in Applied Art, media stream, from Emily Carr University. She has taught various aspects of design at Emily Carr University, Simon Fraser University, and British Columbia Institute of Technology for the past 18 years.

Ken Jeffery

Ken Jeffery instructs in print technology and communication design for the Digital Arts Department at British Columbia Institute of Technology. He holds a Master's of Arts in Learning and Technology from Royal Roads University, where he researched strategies for effectively implementing social media in the classroom. Prior to a move to the world of higher education, Ken spent over 18 years in the printed communications industry. Starting out composing hand-set type for letterpress, he moved quickly to adopt digital design and web2print workflows. As a business owner working on all aspects of business from sales and marketing to production and fulfillment, he brings hands-on experience to today's modern classroom, and he is eager to share his experience with the next generation of visual communicators.

Alan Martin

Alan Martin has a Bachelor of Fine Arts in printmaking from the University of Victoria. He has been involved professionally in the graphic arts since 1977, first in traditional film assembly and then in electronic pre-press from its early days in the 1980s onward. For the past 11 years he has worked for Kodak, supporting their pre-press workflow products. Alan is currently product support manager for the InSite family of web-based review applications. He teaches several courses at British Columbia Institute of Technology, including Colour Management Systems.

Roberto Medeiros

Roberto Medeiros is a production print solution engineer with Ricoh Canada. His career in the copier and digital printing industry began in 1988 as a copier technician. In 2000, his role was transitioned to exclusively supporting colour and production print solutions. In 2012, Roberto joined the Graphic Communications Technology Program at British Columbia Institute of Technology as a part-time instructor teaching Advanced Digital Imaging. In 2015, he achieved his Idealliance Color Management Professional – Master certification.

Steven Tomljanovic

With over 15 years of experience in IT and almost 10 years of experience in the print industry, Steven Tomljanovic has been recognized as a leader in web2print and variable data. He was a part of the first graduating class of the British Columbia Institute of Technology GTEC printing program. Upon graduation, Steven helped companies build their online business presence with great success. He has been honoured with *PrintAction* magazine's PA35, awarded to the top 35 industry leaders under the age of 35 in Canada. Steven shares his passion by teaching e-commerce, web2print, and web marketing courses at BCIT in the GTEC and New Media & Design Programs within the School of Business. Steven currently works as the web2print specialist at MET Fine Printers, located in Vancouver BC.

Versioning History

This page provides a record of edits and changes made to this book since its initial publication in the BC Open Textbook Collection. Whenever edits or updates are made, we make the required changes in the text and provide a record and description of those changes here. If the change is minor, the version number increases by 0.1. However, if the edits involve substantial updates, the version number goes up to the next full number. The files on our website always reflect the most recent version, including the Print on Demand copy.

If you find an error in this book, please fill out the [Report an Error](#) form. If the book was produced in partnership with BCcampus, we will contact the author, make the necessary changes, and replace all file types as soon as possible. If we did not produce the book, we will make note of the error on this page and contact the original producer of the textbook. Once we receive the updated files, this Versioning History page will be updated to reflect the edits made.

Version	Date	Change	Details
1.00	December 17, 2015	Book added to the BC Open Textbook Collection	
1.01	June 6, 2019	Updated the book's theme.	The styles of this book have been updated, which may affect the page numbers of the PDF and print copy.
2.00	July 18, 2019	Entire book revised for accessibility.	<p>Accessibility remediation:</p> <ul style="list-style-type: none"> • Image descriptions added. • Link text edited to be descriptive. • Added an Accessibility Statement • Headings added. <p>Other changes:</p> <ul style="list-style-type: none"> • Added List of links by chapters for print users. • Added pop up features for glossary. • Formulas formatted in LaTeX
2.01	July 30, 2019	The following changes were part of a project to standardize BCcampus-published books.	<ul style="list-style-type: none"> • Added additional publication information • Updated copyright and attribution information • Added ISBNs • Renamed “About the book” to “About BCcampus Open Education” and updated the content • Updated the book's cover

Preface

This book is aimed at managers, business owners, marketing managers, and aspiring social media marketing interns and managers. I will assume that however accomplished in your own field – baker, developer, teacher and that even as successful business owners, you approach the topic of social media marketing as a beginner. Even if you are a digital native, or an avid personal user of social networks, we will treat this book as a guided tour of social media for marketing purposes.

While this is a textbook, it is not meant to read like a traditional textbook, especially on a topic that is rooted in digital to an audience who, let's be honest, doesn't really like to read. No shade. I too would rather watch a YouTube video on how to fix a problem with my laptop than read the manual.

Like many of my Generation X peers, I began using forums and chat rooms in the early 1990's and have watched social networks come and go (AOL and Yahoo chat rooms, Friendster, Myspace) – To those not inclined to spend countless hours online over the past couple of decades, it may seem as if things change too often.

For others, particularly those born into the technology, aka digital natives, social networks as with most technology, are second nature to you, but not having work experience may leave you perplexed as to what your boss/ client / customers really want from you as a social media manager.

If you fall within either one of these audiences, this book is for you. I will do my best to help you sort out a basic understanding of the why of social media as a marketing tool for business, for personal brand building, and perhaps more importantly, where to find supporting information and research to help you design, monitor, test, and re-define a social media marketing strategy.

If you are utilizing this book as an instructor or are considering using this book as an instructor, first of all, *Thank you very much!* Here, you will find the instruction plan and a practical way of teaching students how the principles of marketing work. We will also explore the principles for each prominent social website. Also, the exercises with every chapter will give students a better chance at understanding these concepts as well.

To sum it up, the target audience for the book is a person who is interested in social media marketing for brand building.

PLAN OF THE BOOK

PART 1 – we'll discuss the origins of marketing principles. A definition of marketing and

how many of the concepts that have been around for ages are the same as what we do today in social media marketing. Part 1 answers the question, “what is marketing?” and we’ll begin to explore marketing strategies for the modern age. We’ll touch on the basics principles of marketing and a bit of the psychology of as a way to introduce concepts that hopefully won’t be so foreign to you as we dive deeper into the nature of social networks.

PART 2 — we’ll get into more of what social media marketers know and how it fits within a marketing strategy. We’ll talk about social networks in a way that no matter what networks are present and popular when you read this book, you’ll have an understanding of how you can create content, engage with your customers, and grow your brand.

Open Education at Oklahoma State University

Introduction to Social Media is an Open Educational Resource (OER). This means the book is free (It was a good joke, right?). When Dr. Joshua Daniel became Director of First Year Composition in June of 2020, one of the first things he did was survey instructors and students to learn what they thought of the program. At that time, the program had two commercial textbooks students were required to purchase, and they were in negotiations with another textbook company to add a third. Many things became clear when he talked to students and instructors, but two points are relevant here: 1) instructors hated using the textbooks; 2) students hated the textbooks and generally did not do the reading. Dr. Daniel didn't think that is because instructors or students are lazy; he thought it was because commercial textbooks generally aren't very good. The reason for this is they, as products that need to be marketed and sold for profit, need to be as applicable as possible in as many contexts as possible. In other words, the textbooks the program was using stood the best chance of being profitable if they were equally as useful at OSU as they would be at OU, or UC Davis, or NYU. See the problem? Even though many commercial textbooks are quite good, by being applicable in so many contexts, they are never as good as they could be in any specific context. This book was built by and for the instructor of this course, an entrepreneur and practicing professional in her field. Moreover, when we find problems, we get to update it as you go (none of that, "Do I have to purchase the third edition, or can I get by with the second edition?").

So that's a reason to embrace Open Education: the textbooks are better. Here is another. Education is both a right for every human being and a responsibility for every democratic nation. Speaking as a 90's child now staggered by student loan debt, Joshua Daniel comments with certainty you are already paying more than enough for your education, and textbooks for your courses, when possible, should not add to that burden. All told, if you calculate the three textbooks previously in use for the first year composition program, students were spending just under half a million dollars per academic year on commercial textbooks. This for textbooks that instructors hated and students did not read. Not the best investment, at least not for us. Dr. Daniel believes all of you have a right to pursue education as far as you wish, and a small way we can help enable that is to remove as many barriers to entry as possible. Dr. Daniel was a first-generation college student. He grew

up on a farm in Mississippi. Both of his parents had to drop out of high school for work, and none of his siblings were able to pursue higher education. When he arrived at my first undergraduate institution (he bounced around quite a few before he managed to graduate) he was lost and straight up broke. He dropped more than one course simply because he could not afford the textbooks. Many of your instructors have similar stories to this. For this reason as well as others, the instructor of this course is committed to removing the cost of commercial textbooks as a barrier to your education.

Accessibility Statement

OSU Libraries and Oklahoma State University believe that education must be available to everyone; this means supporting the creation of free, open, and accessible educational resources. We are actively committed to increasing the accessibility and usability of the textbooks we produce.

Accessibility features of the web version of this resource

The web version of *Who Teaches Writing* has been designed with accessibility in mind. It is our goal to optimize the resource for people using screen-reader technology. Content should be navigable using a keyboard, and links, headings, and tables should be formatted to work with screen readers. All images considered essential include alt-tags. Information is not conveyed by color alone, and there is an option to increase font size. (See tab on top right of screen titled, “Increase Font Size.”)

- It has been optimized for people who use screen-reader technology.
 - all content can be navigated using a keyboard.
 - links, headings, and tables are formatted to work with screen readers.
- All images in this guide are screenshots that are considered non-essential as they are described fully in the text. As such, they do not include alt tags.
- Information is not conveyed by color alone.
- There is an option to increase font size. (See tab on top right of screen titled, “Increase Font Size.”)

Other file formats available

In addition to the web version, this book is available in a number of file formats including print PDF, EPUB (for eReaders), digital PDF and various editable files. Here is a link to

where you can download this book in another file format. Look for the Download this book drop-down menu to select the file type you want.

Known accessibility issues and areas for improvement

While we strive to ensure that this resource is as accessible and usable as possible, we might not always get it right. Any issues we identify will be listed below. There are currently no known issues.

PART I: MARKETING PRINCIPLES

Marketing in the Age of COVID-19

If 2020 taught us anything, it is that our work lives are no longer about being in a specific location, small businesses are essential businesses, Wi-Fi is a luxury not afforded to so many in our society, and toilet paper is king. But I digress.

As millions of people worked from home, businesses were forced to adapt, the gig economy provided a new way for small businesses and individuals to survive financially. Without a doubt, social media and other digital platforms were better equipped at handling all of our professional and personal needs than most previously realized. You only need to look at companies like Zoom, Instacart, TikTok, and Youtube as examples of how important digital marketing is to all of us.

Videoconferencing apps saw a record 62M downloads during one week in March

1.1 What Is Marketing?

The American Marketing Association defines marketing as:

“The activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large.”

<https://www.ama.org/the-definition-of-marketing-what-is-marketing/>

This definition sounds pretty vague and general, but one word should stand out to you in this description – **Customers**.

In the well-known marketing Guide, *Principles of Marketing*, the authors Philip Kotler and Gary Armstrong explain marketing in the following ways.

“Marketing, more than any other business function, deals with customers.”

“Marketing is engaging customers and managing profitable customer relationships”

– *Principles of Marketing*, Northwestern University 13th edition

Their definition may sound a little more familiar to those of you in business. Marketing professionals assist businesses in attracting new customers through superior value proposition as well as achieve customer satisfaction to earn loyalty and build credibility.

It's a prevalent misconception that marketing is all about selling and advertising. Others misinterpret the concept and think that marketing involves promoting products available in display shelves at stores and maintaining inventories of products for future sales. However, the job of a marketer isn't only inventory management and pushing people to purchase their products.

What is Marketing Today? With Seth Godin

1.2 What Is Digital Marketing?

At a high level, digital marketing refers to advertising delivered through digital channels such as search engines, websites, social media, email, and mobile apps. Using these online media channels, digital marketing is the method by which companies endorse goods, services, and brands. Consumers heavily rely on digital means to research products. For example, Think with Google marketing insights found that 48% of consumers start their inquiries on search engines, whereas 33% prefer to consult brand websites and the remaining 26% consumers search within mobile applications.

While modern day digital marketing is an enormous system of channels to which marketers simply must onboard their brands, advertising online is much more complex than the channels alone. In order to achieve the true potential of digital marketing, marketers have to dig deep into today's vast and intricate cross-channel world to discover

strategies that make an impact through engagement marketing. Engagement marketing is the method of forming meaningful interactions with potential and returning customers based on the data you collect over time. By engaging customers in a digital landscape, you build brand awareness, set yourself as an industry thought leader, and place your business at the forefront when the customer is ready to buy.

By implementing an omnichannel digital marketing strategy, marketers can collect valuable insights into target audience behaviors while opening the door to new methods of customer engagement. Additionally, companies can expect to see an increase in retention. According to a report by Invesp, companies with strong omnichannel customer engagement strategies can retain around 89% of their customers as compared to companies with weaker omnichannel programs that have a retention rate of just 33%.

As for the future of digital marketing, we can expect to see a continued increase in the variety of wearable devices available to consumers. Forbes also forecasts that social media will become increasingly conversational in the B2B space, video content will be refined for search engine optimization (SEO) purposes, and email marketing will become even more personalized.

“Digital is at the core of everything in marketing today—it has gone from ‘one of the things marketing does’ to ‘THE thing that marketing does.’”

– Sanjay Dholakia, Former Chief Marketing Officer, Marketo

How Many P's are in Marketing Now?

The concept of Marketing Mix is evergreen in the marketing industry. Despite the world moving from traditional to digital marketing, this stays effective and relevant for businesses. Since it's a mixture of four different elements, it's often referred to as 4 P's of Marketing. Neil Borden first came up with the term Marketing Mix. However, it was later popularized by Jerome McCarthy of Notre Dame University who named it "the Four P's of Marketing". He used it first in his marketing guide, "Basic Marketing: A Managerial Approach".

The Father of Marketing, Philip Kotler, highlighted the 4 P's of Marketing in the following manner:

"Marketing Mix is the set of controllable variables that a firm can use to influence the buyer's response."

Product

In simple words, a product is a market offering that solves a problem for consumers. It can be a good, service, or experience and can be tangible as well as intangible.

Businesses invest in products that meet an existing customer need and can earn profits due to their high demand in the market. Traditional businesses opt for product ideas that are well-known to their audience. For instance, a traditional business person may start manufacturing and selling running shoes to athletes. Innovative entrepreneurs, however, have a different mindset.

Such business people turn to innovation and create a need for their products. Uber is a popular example of innovation. They noticed taxi services and came up with a unique idea to facilitate customers. Instead of purchasing vehicles, they developed a platform to connect customers with taxis and generate revenue through commissions. Some other top innovative businesses include Apple, Amazon, Tesla, SAP, The Walt Disney Company, etc.

There are three levels of any product that are as follows:

- **Core Product** – This is the main product that satisfies the fundamental customer need. For example, the core benefit of a car is the ease of traveling
- **Actual Product** – This involves additional design features that add value to customers. For example, car manufacturers design vehicles with appealing interior and exterior body and install heating system, music system, and more features to attract customers
- **Augmented Product** – This refers to the additional features that aren't a part of the actual part but meet the wants and needs of specific audiences. For example, car dealers may offer free or discounted insurance policies to new buyers

Types of Products

A product can be a good, service, experience, or idea that can be sold or exchanged. It is further divided into two categories: Consumer Products and Industrial Products.

Consumer Products are those that are ready for consumption and can meet consumer needs without further processing.

It is termed as Convenience Product when the customer tends to buy it on a frequent basis without spending much time in research. Its example is detergent or dairy products.

Another type of consumer product is Shopping Product that involves higher customer engagement. Customers spend significant time and efforts in learning about the quality, features, and longevity of the product. They may compare multiple brands to shortlist the best product option before making a purchasing decision. Its examples can be gaming devices and microwave ovens.

Specialty Product is another type which includes products focused at specific niche. These are premium quality products that target smaller customer groups and those customers are willing to pay a premium price for the brand. For example, Rolls Royce cars and Rado watches.

The last type of Consumer Products is Unsought Product which has lesser market demand because customers either don't feel the need to purchase them or don't know much about the product. Therefore, marketers have to aggressively promote and advertise them. Common examples of unsought products are funeral insurance, smoke detectors, and cemetery plots.

As the name suggests, **Industrial Products** are those goods that are used by businesses. These can be further categorized into three types.

The first type of industrial products is *Capital Item* which includes items that support buyer's operations. For instance, a plumbing business may purchase wrench, drill, and pliers to install and repair plumbing pipes for their customers.

The second type of industrial products is *Materials and Parts* which refers to raw materials. These products are further processed and usually become a part of a larger product. An example is bottle caps purchased by a pharmaceutical company. These bottle caps are of no value when sold as a stand-alone product and installed on medicine bottles before reselling.

The third category of industrial products is *Supplies and Services*. Its examples are roof repairing service, smartphone repairing service, and operating supplies such as primers for house painters.

Product Lifecycle

A product usually goes through multiple phases since the idea inception. Businesses must analyze the current standing of their products and come up with relevant strategies to stay ahead of the competition. This PLC has five stages: New Product Development, Introduction, Growth, Maturity, and Decline. This must be noted that not every product experiences all five stages.

New Product Development stage is when the business only has a new idea and they need to invest in the idea to develop the product. New product development starts when a stakeholder gets a new idea. This idea is tested to determine whether it would be viable in the market before developing the product. After thorough analysis and testing, the product is made available to customers.

The next stage is *Introduction* and this phase starts immediately after the product is launched. During this time, sales are usually low and businesses focus on increasing awareness.

The third stage is *Growth* when the product starts generating profits and more and more customers get introduced with the brand.

After the growth stage starts the *Maturity* stage. This is when the product attains maximum profits and can't further increase profits or market share. The business can develop appropriate strategies to retain the product in this stage for the longest possible period.

Every product has a limited lifespan and sooner or later, its popularity comes to an end.

This is when the product enters the *Decline* stage. During this phase, sales gradually drop and customers lose interest.

Price

In a marketing mix, pricing is the amount of money customers need to give up to obtain a product or service. This is one of the most important elements that defines the profitability and sustainability of a company.

Pricing Strategies

While deciding the right pricing strategy is crucial, many businesses fail to do so. Their prices are either too high or too low since they fail to understand market dynamics. If a product is priced too high, customers are less likely to show interest since they would rather turn to alternative options that offer higher value at lower prices.

On the other hand, if a business sets their prices too low, they may end up losing revenue. If the price doesn't cover the cost, the business would experience huge losses. Furthermore, customers often regard a product to be of low quality if it's priced too low as compared to other similar products. Therefore, it's vital to set the most suitable price for a product.

There are multiple strategies for setting the right price, but we will discuss only the prominent three strategies: value-based pricing, cost-based pricing, and competition-based pricing.

Customer Value-Based Pricing strategy relies on customer perception of the product and brand. The higher value customers perceive, the higher will be the price of the product. Marketers that prefer to take this route should evaluate whether or not the product delivers expected benefits to customers to increase sales and earn customer loyalty.

Another common strategy for setting the price of a product or service is known as **Cost-Based Pricing**. This strategy enables a business to set the price of the product by considering different types of costs involved.

If you take a look at costs involved in manufacturing a product, you will notice costs such as Direct Material, Direct Labor, and Factory Overhead Costs.

Direct Material is the cost of raw materials that directly go into manufacturing the final product. Direct Labor includes the expenses of the labor force that directly engages in the manufacturing process of the said product. Lastly, Factory Overhead Costs covers all other expenses that aren't a part of direct material and labor costs. This may be supervisor salary, utility bills, security guard wages, etc.

Apart from these categories, Cost can be categorized into two types based on its behavior. These are Fixed Cost and Variable Cost.

The former stays the same regardless of the level of production. Let's take the example of a magazine facility. Regardless of how many magazines are printed by the publisher, certain costs would stay the same such as rent of the facility and depreciation of machinery.

The latter cost, however, increases or decreases with production. The more units of products are manufactured, the higher will be the variable cost. In the above-mentioned the magazine facility example, the cost of paper is variable. The more magazines are printed, the higher amount of pages would be needed that will automatically increase the price.

Competition-Based Pricing refers to the pricing strategy in which a company decides to set product prices by analyzing the prices set by competitors for similar products. However, it's important for the company to compare features, benefits, costs, and perceived value before adopting this strategy.

New Product Pricing

When it comes to deciding the price of a new product, there are two different ways to do so: market-skimming and market penetration. The key to setting suitable prices for new products is to understand the market and customers.

During the product introduction phase, the company focuses on building awareness. They may opt for Market Penetration Strategy to propagate the product in the market. This strategy works best if the product is intended for the mass market. Lower pricing gives such brands a competitive advantage and they can achieve customer attention through reduced pricing.

The other option for selecting a price for a new product is market penetration. This

means a business sets premium prices for products instead of taking the low-pricing route.

This strategy is ideal when the product is innovative and can change the lives of customers for the better. First movers may benefit from this strategy and earn high profit margins. Furthermore, market skimming also works when a product targets a niche market that agrees to pay premium pricing due to brand image or quality.

Place

Also referred to as placement or distribution, Place is a fundamental element of marketing mix. It is the process of strategically delivering a product to places where customers can easily find and purchase it. Marketers need to ensure that the product is readily available to customers at the place of their choice. Even the highest quality products can fail if they aren't available to customers when needed.

For instance, a customer may visit a superstore to purchase kids' diapers. They may look for diapers by ABC brand, but if the product isn't available, they would end up purchasing another brand. If the new product meets their needs, they are likely to stick with it. As a result, ABC would lose loyal customers.

It's rightly said that "Out of sight, out of mind". This proverb perfectly explains the distribution concept. Ineffective channel distribution hurts businesses like nothing else. Products that aren't delivered to customers on time lead to customer dissatisfaction, ruin brand reputation, and cause inventory management problems.

Distribution Channels: What Are the Options?

Distribution channels or marketing channels describe the methods through which a manufacturer makes the product available to potential customers. A manufacturer has two major options to achieve this goal. They can either distribute the product on their own and keep this function in their hands or involve as many intermediaries as needed.

The first option is **Direct Distribution** in which the company hires staff and sets up operations in the geographical areas of its target audience. This approach enables customers to purchase the product directly from the manufacturer. While significant

investment is required to initially establish a network, this approach can reduce on-going channel management costs since the company directly sells its products to consumers. A common example of this case is Dell Computers.

Direct distribution is suitable for businesses that have sufficient resources and a strong network. It's also important to understand the needs of the local market to best meet customer needs. Otherwise, the decision may backfire and the business would incur huge losses.

The other option is **Indirect Distribution** where a business involves third-parties to make its products available to target customers. Businesses can benefit from the expertise, network, and local experience of distributors. Furthermore, these distribution networks can also help a business expand its customer base and find suitable vendors.

Before making the decision to outsource distribution management, a business should understand its risks too. While this decision saves businesses from the cost and efforts of creating a distribution network, it decreases your control over place-related decisions. Moreover, manufacturers and intermediaries sometimes get into conflict which may negatively affect the performance of the distribution channel.

Now, let's take a look at some prominent intermediaries that can be part of a distribution channel.

Wholesalers Intermediaries purchase products in bulk and usually sell them to retailers or other businesses at lower rates. Since they purchase the product in higher volumes, they benefit from the **scale of economies** concept and get reduced pricing from the manufacturer.

Retailer Intermediaries may purchase the product from the manufacturer or another intermediary to sell the product to consumers. Nowadays, retailers are turning to digital platforms, including social media to facilitate customers in purchasing the items they need from the comfort of their home.

Aside from distributors, wholesalers, and retailers, a business may consider hiring independent facilitating agencies to outsource specific tasks. These agencies can be logistics and warehousing providers, order fulfillment agencies, advertising agencies, financial agencies, and insurance firms.

The keynote in this section is that not every business engages all types of intermediaries. They may acquire the services of certain third-party businesses as per their needs. When the business grows, they may consider setting up an in-house distribution department and eliminating these intermediaries through vertical integration.

Promotion

Promotion refers to activities that are helpful in selling a product. These activities are important to familiarize customers with the brand. Regardless of how good a product is, the brand won't be able to achieve sales goals if target customers aren't aware of its existence.

Many people confuse promotion with advertising. However, advertising is only a small component of this entire process. The business may start promotional activities even before the product enters the introduction phase. They may create the hype to raise brand awareness and encourage the audience to give it a try.

The purpose of promotion is to increase awareness and generate sales and leads. It's a must to set appropriate KPIs (Key Performance Indicators) to determine whether the activities are proving fruitful. Based on these KPIs, the business can evaluate its performance and review promotion strategies accordingly.

Some of these KPIS can include:

- Customer Acquisition Cost
- Marketing Qualified Lead
- Sales Qualified Lead
- Customer's Lifetime Value
- Website visits
- Marketing ROI

The Marketing Mix – Is It Still Relevant Today? – Business 2 Community

Social Media Marketing. A Brief History

Social media is one of those phrases that many people think they should know because it involves the word “social”. After all, people are social beings and can’t survive without interaction.

Today’s kids spend most of their time indoors, playing video games or lying around. This is why mothers encourage kids to go outside and be social. Being social is human nature and a desirable thing.

The next important word in social media is “Media” and it refers to the methods of communication information. From news channels to newspapers, these mediums have a huge influence on society and help people stay up-to-date with the latest information. These organizations capture the attention through compelling storytelling and captivating images.

There has always been a strong relationship between businesses and traditional media. Media has always been good at gathering people to read, watch, or listen to something of interest. From young kids to retired people, they have something for everyone. Knowing this, businesses run ads on print and digital media to cash in on this interest and convince people to buy their products. This is a norm in the business world and it’s normal for a business to attempt to influence consumer behavior through lucrative advertisement.

Back in the day, neighbors would meet each other in the street and co-worker would meet and chat at the water cooler to discuss the latest news and trends. Sometimes the conversation was about life and death and sometimes it was simply about a discount at a local store. Regardless of the discussion topic, people would communicate. Modern technology hasn’t eliminated the need to meet at the water cooler. Instead, technology made it easier to share information with family, friends, and colleagues.

It has turned every person into a market maven. For example, you can capture a robbery at a local auto dealer on your smartphone camera and send it to your local TV station within seconds, or you can snap a few shots of a new hybrid vehicle at the showroom and send it to your brother who’s trying to reduce his carbon footprint.

Social Marketing Is Not New

The reason why many marketers struggle with gaining expertise in social media marketing is that they consider it a new and foreign method of marketing. However, social networking isn't something new. It has always been present in society in one way or another. The only difference between modern and traditional social marketing is technology.

Back in the day, people used to throw parties on New Year Eve or other special occasions. Such events are still held today, but none of them can match parties arranged by Malcolm Forbes, the well-known entrepreneur and the publisher of Forbes Magazine. His 70th birthday party, held in August 1989 created a buzz with its exotic theme, extraordinary arrangements, and the list of famous guests who joined him on his birthday.

The purpose of social gatherings is to celebrate accomplishments as well as meet new people and make friends. You can meet people you may or may not know, get to know them, share thoughts with each other, and make lasting relationships that can come handy in the future. Now compare this with modern social media platforms. Don't they serve the same purpose?

Networking events don't only revolve around business meetings. These conferences have always been family events where business people attended meetings and then enjoyed dinners and games of golf with their spouses. These activities make conferences enjoyable and give entrepreneurs a chance to meet like-minded people in an informal setting.

By critically analyzing social platforms, we can reach the conclusion that social media is like a cocktail party. At these parties, people enjoy themselves, make connections, and often discuss business ideas. It's not uncommon to find people who are interested in your idea and set up a partnership startup with their help.

Social Marketing: Modern Times

In the book *Social Network Analysis: Methods and Examples*, Song Yang and two other co-authors verified the claim that the concept of social marketing is not new in the following words:

“Social networks have been a defining feature of society.”

In the modern times, brands such as Mary Kay and Avon are known for promoting networking. With their multi-level marketing schemes, they encourage customers to refer new customers and earn a commission on every sale. These people then held events and invited over people they knew. This way, they could get in touch with their network to promote these products. These strategies work on the principles of networking and social marketing around the community. These days, people mostly use digital platforms to find referrals.

This concept has always been a part of business marketing. Many of you must be familiar with conferences held at huge Conference Centers. I remember when distributors in the automotive industry used to have full house dealer conferences in Las Vegas, Nashville, Chicago, and other big cities. At these conferences, automotive dealers and enthusiasts can preview the latest models. These days, car shows like Back to the 50's Car Show, Goodwill Festival of Speed, and SEMA Show are all the rage.

Another modern example is the annual TechCrunch Disrupt conference held in cities across North America and Europe. At these technology events, IT startups and professionals can meet new faces, learn from experiences of others, and build business connections. These events support marketing activities and promote brands like nothing else.

Social Media for Business

Not many people realize that social channels can offer unprecedented business opportunities. People prefer to conduct business with people they trust and with whom they share a social experience.

For instance, when a person skydives, the memory stays with them and they enjoy sharing it in social gatherings. If another person accompanied them to the activity, they would excitedly recall the skydiving experience whenever they meet them. This creates a bonding between strangers. Similarly, it's normal for a person to reminisce about the memories of shared experiences with people they know.

The gist of this discussion isn't a new concept. It's rather a new source of sharing experiences. Take the example of a conversation on a Facebook group. The group members share social experiences by sharing posts and posting comments on content. They may later discuss that particular conversation in an online or in-person setting. This conversation is likely to lead to a discussion about potential business opportunities.

Regardless of the platform you use, social marketing thrives on shared experiences. Social media users share experiences in several ways. They may follow each other on Twitter, Instagram, and TikTok or subscribe to YouTube channels to become a part of their experiences.

While many social websites can be found in the digital world, the following 10 sites are extremely useful for businesses:

- Facebook
- Instagram
- YouTube
- Twitter
- TikTok
- Pinterest
- Yelp
- LinkedIn
- WhatsApp
- Snapchat

On Facebook, businesses can set up pages or groups to stay in touch with followers. Instagram, Pinterest, and Snapchat are also trending because visual content usually attracts internet users the most. The same goes for YouTube where more than 5 billion videos are watched per day. LinkedIn is mainly a professional platform and it works best for attracting corporate audiences.

One of the major benefits of social media is that businesses can build global followership. They can interact with followers through posts, live videos, and messages. Moreover, they can also target the right market segment on the basis of their interests or geographical location. For instance, Instagram and Snapchat are more popular among teenagers and youngsters. Businesses that intend to reach the younger audience can get active on these platforms to get desired results.

Social media aids businesses in raising brand awareness at a fraction of the cost as compared to other marketing methods. Engaging content can be posted such as text posts, videos, images, and polls to gain attention. If the content is valuable and attracts followers, they would share it on their social profiles and become brand promoters. Therefore, it's a must for businesses to build a social media strategy.

Despite the various benefits of social media, not many business owners are able to fully utilize these platforms. However, the following tips can help them stand out:

Shortlist the Most Suitable Platforms

It doesn't make sense to set up a profile on every popular social media platform. Not only does it waste time, but also tampers with the efficiency and makes it difficult to stay connected with the audience.

It is rather a better idea to choose platforms where the target audience is present. By staying active on social sites where the ideal audience is present, companies can build a community and become a well-known name in the industry.

Visual Content Is Important

The more engaging the social media posts, the better will be the performance. To attract followers, a brand ought to add visual content in social media posts. This may include video clips, images, and GIFS. Moreover, brands can also ask questions from followers to encourage interaction.

Social Media Contests

Another effective way to drive engagement is to host competitions on social sites. A brand may ask followers to share a post with as many people as they can. The person who invites the most social users to the page can be offered a gift hamper or discount vouchers.

Try Social Media Ads

Social media sites enable businesspeople to promote their brand and products through unpaid posts. But they can also turn to paid advertisement to attract targeted followers and increase engagement in a shorter span of time. Aside from regularly posting updates, brands must also run ads on Facebook and other social sites to generate leads and boost revenue.

What Business Are You Even In?

Do you aim to become a successful marketer and build brands? Then before you begin the journey, ask yourself a simple question. *What business am I in?*

I know the question may seem quite strange to your ears, but let me explain. The reason why many marketers fail to achieve their goals is because they lack industry knowledge. You need to have a strong grasp on current industry and market trends to come up with an effective marketing plan.

Whether you want to develop a marketing plan for your own startup or intend to develop a plan for a client, you need to have clear goals. Before proceeding, find the answers to the following questions. Trust me, social media marketing will get much easier for you.

- What is the purpose of the business?
- Am I selling a product or a service?
- Why do I want to run a social marketing campaign?
- Which resources are available for marketing?
- Should I use traditional marketing along with social media marketing?

Picture this scenario.

You run a small business and offer services to customers, let's say web development services. You recently learned about the benefits of digital marketing and chose Facebook platform to promote services and gain clients. Before thinking anything else, you jump onto the platform and invest money in running ads. But the efforts go in vain when you notice the investment didn't generate sufficient ROI.

So, why did the social marketing campaign fail despite the investment of huge resources?

The answer is simple. There was no effective plan to make the campaign fruitful. This is why it's important to be clear about your industry and goals before taking action.

Know Your Business

It's easy to start a business. You have to choose a product that not only attracts you, but also has a market demand. Then you need to come up with a business plan and gather sufficient resources and bam! You are ready to become an entrepreneur. But is it enough to survive in today's competitive market?

Every entrepreneur strives to make their business a success. While it's no piece of cake, you can achieve this goal through an effective plan.

The first step is to understand every aspect of our business. From suppliers, to customers, market trends, legalities, and marketing avenues, you ought to understand how your business works. You can make better decisions if you know your business well. Let's have a look at certain aspects of business marketing that are crucial for every business.

Know Your Customers

A business cannot survive without customers. Whether you specialize in selling products or services, you need to offer products that solve specific problems of customers. When they purchase these solutions, your business will earn revenue that is crucial for supporting operations.

Therefore, you need to know who your ideal customers are. When you know their lifestyle, preferences, and interests, and demographics, you can better promote products.

From market segmentation to developing buyer persona, there are several strategies to identify ideal customers. We will discuss these strategies in more depth in the 6th chapter.

Customer Relationship

Customers are the vital stakeholders for your business and you can't ignore them. When you understand who your customers are, you can offer products or services that meet their needs. With the help of top-notch customer service and quality products, it's possible to gain their trust and build lasting relationships.

Marketing isn't only about aggressively advertising your products and forcing customers to give them a try. What's more important is to focus on building relationships. Most customers prefer purchasing brands they trust.

Take the example of a salesperson in a hardware shop. When a customer wants to buy a product, the salesperson can earn their trust by guiding them about which brand or product would be suitable for their needs. Knowing that the business cares about customers, they would return to the shop whenever they need hardware supplies.

The modern social media marketing isn't much different. Through your social media page, you can interact with customers to answer their queries and share valuable information. When they start trusting you, they become loyal customers. They may also become brand promoters by recommending your business to their social circle.

Customer Engagement

The term customer engagement is often associated with social marketing, but it has been a part of marketing for ages.

Brick and mortar stores used to keep customers engaged through personal interactions. For instance, a small business owner would talk to in-store customers to ask for their opinion about products. They would conduct surveys and short interviews to understand their problems and further improve quality. Suggestion boxes have always been present in stores so customers could share their suggestions.

The concept of customer engagement is still the same, but social marketing has made it easier for businesses to increase engagement. They can set up social media profiles and post informational content to educate customers.

Social platforms facilitate customers to interact with a brand through private messages or comments on posts. They can easily share their suggestions and ideas as well as the issues they faced when interacting with the business. Through regular interactions, your brand stays on top of mind of customers and they are likely to stay with you in the long run.

Customer Reviews

Brand goodwill is an invaluable asset. Through a good reputation, businesses can gain a myriad of benefits such as more customers, power to negotiate better rates with vendors, lower interest rate on credit, and much more. An effective way to establish goodwill is through positive customer reviews which aren't possible without exceeding customer expectations.

Since before the advent of modern business methods, people have relied on word-of-mouth technique to choose a product. This is still very much in practice. When you need new shoes, you may ask your friends which product out there is the best. This is the oldest form of customer review and endorsement. Digital media has made things much easier.

Customers can now easily share their feedback or reviews via the business website, Yelp, or other social profiles. Any person looking for similar products can go through these to make up their mind.

Lead Generation

Leads are prospective customers who have a particular interest in the market offerings of a firm. The company collects information of those potential customers and designs a strategy to capture their attention.

No matter how large your business and how much resources you have, you can't promote your products to each and every individual or business out there. It doesn't make sense!

What you should rather do is to specify your audience and put in the effort to convert those people into customers. And this can't be possible through lead generation.

Traditional marketing relied on personal interactions for generating leads. Salespeople would go door to door to promote products. Companies often sent direct mails to potential customers. Furthermore, networking events, radio or TV ads, pamphlets, and customer surveys were extremely helpful in this regard.

The purpose of lead generation didn't change with time. What really changed are the methods through which marketers perform this task.

The internet has modernized lead generation. Businesses can now easily create a lead generation form through MailChimp or other online tools. The link to this form can be

shared with customers via email, social media or website. And customers are offered incentives in exchange for their contact information. This information enables marketers to send personalized offers and information to interested customers.

Social platforms such as Facebook and LinkedIn also offer businesses to run targeted ads for lead generation purposes.

Competitor Analysis

Always remember that your business isn't the only business in the industry. With so many business people working hard to succeed, you can't ignore the competition. After all, businesses that simply ignore the tactics of their competitors tend to fail down the road.

Remember what happened to *Yahoo*? They were once the leading internet company around the globe. In 1998, a new small business entered the market, named *Google*. The founders offered to sell the company to Yahoo in 1998 for a meager sum of \$1 million. But the tech giant refused the deal. In 2006, they had another chance to buy another emerging company, Facebook. However, the CEO rejected the deal again.

What happened then? Yahoo made bad decisions because it ignored the great potential of new market entrants. If they performed effective competitor analysis, they could come up with better strategies to retain their market share in the tech world.

The conclusion of this scenario is that businesses must be aware of their competitors, no matter how small they are. There are several techniques such as Porter's Five Forces Model through which a company can evaluate and analyze its competitors. We will discuss these strategies in Chapter 7.

New insights for new growth: What it takes to understand your customers today (mckinsey.com)

Do You Even Google?

Who doesn't want to make a good impression on others? When we meet people we never got the chance to meet before, we often feel the urge to impress them. After all, it's rightly said that *first impressions are last impressions*.

The same goes for your business. You want to build a reputation and make a positive impression on potential customers when they first interact with your brand.

With an immense increase in ecommerce stores over the past decade or so, the buyer journey now usually starts online. When customers face a problem, they turn to the internet to find a product that solves that particular problem. Not only do they collect information about suitable products, but they also conduct research to compare different available options. At this time, reviews of past customers and product details help them make the right choice.

As a marketer, don't forget that this research is mostly done via a search engine.

How Search Engines Work

You must be familiar with search engines. But do you know how they work?

There are over 1.8 billion live websites on the internet today and this number is constantly increasing. It's not possible to organize such a huge quantity of web pages and find the information you need. Thanks to search engines, this is no longer a challenge.

A search engine is an online program that checks published web pages and ranks them to facilitate users. Whenever a user enters a search term, they go through these pages and list the most suitable items.

For this purpose, it performs several tasks. The first of these is Web Crawling and is performed by bots. This refers to the process of searching available content. Crawling is done to find new pages as well as review the existing web pages.

Next comes the Indexing. Did you read the index of chapters at the start of this book? You must have read chapter names and then accessed the chapter relevant to your need. Indexing works the same way.

Google bots and bots by other search engines create an index of published pages and display relevant results when a user asks.

The last step is Ranking. Do you wonder how search engines determine which websites are relevant when you enter a search query? Then let me disclose that this action is done via ranking. Published pages are ranked as per their relevance, quality, and originality. Whenever a user performs a search, these pages are displayed as per the ranking.

Top Search Engines

While there are many search engines available to internet users, the most popular one is Google. In fact, this paved way for a new phrase, **Google it!**

When a person wants to find some information, they usually turn to Google to find answers. It's no surprise that Google holds around 75% of global search market share. Here are a few other popular search engines you can try:

- YouTube
- Bing
- Amazon
- Ask
- Aol Search

Google is the leading search engine and YouTube occupies the second position. And guess what? YouTube is also owned by Google.

Google Search

Interested in capturing customer attention and convincing them to purchase your products? Then you need to ensure that they can easily find you via search engines. Hence you need to focus on increasing brand visibility.

Start the process by searching for your business on Google. You will notice a list of results. This may include your website and social media pages. However, you may be

surprised that Google displays other businesses in the same list. And sometimes, other businesses are ranked above your own venture.

The next step is to improve the ranking of your business in search results. This way, more and more potential customers can find you online and you can convert them into loyal customers by making a good impression.

How to Improve Search Engine Visibility

Businesses are competing with each other to secure the highest search engine ranking because top 3 search results for any search query tend to attract visitors the most. Google evaluates businesses on the basis of over 200 factors to determine which of these are most relevant to users.

There are various strategies to improve ranking, be more visible, and impress customers. Let's take a brief look at some of the most prominent strategies:

SEO

Search engine optimization is the process of gaining higher visibility in an organic way. Some sources claim SEO to be free, but let's not forget nothing is free in this world. You have to pay a cost for everything. As for SEO, the price is your time and efforts.

SEO is a complex, on-going process. Since there are no hard and fast rules, you can learn SEO best practices through the trial and error method. Google also provides basic guidelines to facilitate business owners.

The best strategy for a business is to value customers and consider their preferences. An essential step is to have a user-friendly website. If you don't have a website yet, it's time to get a business website. These websites are not too expensive and some platforms such as WordPress and Wix offer free websites with certain limitations.

The interface or design of the website should be simple. The easier it is to use different functionalities, the better will be the treatment by search engines. Whether you design a website on your own or hire a professional website designer, getting a good understanding of design guidelines will assist you in implementing SEO strategies.

Search engines are very particular about content. They penalize websites that plagiarize

content from other web pages. So, not only should you come up with unique content, but also add valuable insights that add value to potential visitors. Through quality content, you can attract higher traffic volume and significantly improve the search engine ranking.

Google My Business Tool

Now that you know how important it is to build impactful online presence, you can't ignore Google My Business. It's a powerful tool that enables businesses to create business listings and manage their appearance on Google platforms including Maps and the search engine.

Traditional marketing interacted with the audience through newspaper ads, billboards, and setting up promotional stalls in shopping malls. With this digital tool, interaction is now much easier. You can understand how customers interact with your business.

This platform facilitates businesses to attract potential customers via attractive images, useful information, and satisfied customer reviews. With the help of detailed analytics tools, it's no longer a challenge to find out demographics, geographical location, and interests of target customers.

Run Paid Ads

Aside from organic marketing, you should also add paid advertisement to your marketing strategy. Search engine ads and advertisement on social media are effective in raising brand awareness, generating leads, and increasing revenue.

Although these ads appear at prominent positions on screen and increase visibility, you need to meet specific criteria. However, if done right, these paid ads can help you in achieving goals and customers will start noticing you through Google.

Blogging

Around 78 million blog posts are published every month and receive over 77 million

comments by readers. These statistics are eye-openers for marketers who want to gain attention and gain brand visibility through digital marketing.

Back in the day, marketing people wrote articles for magazines and attended interviews with reporters for better visibility. These methods are still a part of marketing, but blogging and especially guest blogging has made it easier for startups to compete with larger businesses despite limited financial resources.

You can set up a blog for your customers and share valuable insights about their areas of interest. For instance, you can write posts about how the business adds value and share valuable tips to build credibility. Digital platforms like Medium and LinkedIn are suitable for this purpose. Moreover, you can also publish guest posts on reputable websites such as Forbes and Inc.com to increase traffic to your website.

Miscellaneous Options

Remember the yellow pages directories that listed a myriad of businesses along with their contact information? Not much has changed today when it comes to these business directories. The only difference in traditional and digital marketing is that directories are now available online.

Online business directories publish information of businesses on websites. The most popular ones are Yelp, Angie's List, Zillow, TripAdvisor, YellowPages, Foursquare, and many more.

It's an effective way to let people know about your market offerings and share contact information. Furthermore, Quora is another great platform to communicate with potential customers by sharing answers to their questions and informing them about your products.

Is SEO Important for Every Business?

Who Is Your Customer?

A prevalent myth about marketing is that the more you promote a product, the higher will be the chances of increasing sales. However, marketing enthusiasts know this statement is far from the truth.

The key strategy for promoting a brand is to identify ideal customers. This approach makes it easier to target customers and develop the right actionable marketing plans that are likely to attract customers. A lesser-known, yet effective way to build a customer base is to focus on personality tests, especially the DISC test.

What Is the DISC Test?

DISC test is an effective personality test, based on the DISC theory by William Moulton Marston. It explores behavioral characteristics of a person based on four categories: Dominance/Directing, Inducement/Influence, Submission/Steadiness, and Compliance/Conscientiousness.

With the help of this tool, marketers can identify their character traits and develop a plan to better fit into their job roles. For instance, if you are a shy person and find it difficult to interact with others, this tool can guide you about the best action plan for achieving personal and professional goals.

It indicates the general behavior of a person and highlights factors that motivate them. It offers self-awareness and provides you a chance to learn about your strengths and weaknesses. Being a marketer, you would benefit from learning about your tendencies. You can work towards managing those weaknesses and leverage strengths to succeed.

As you progress in your career and reach top management position, you may want your team to take the DISC personality test as well. It's a great tool for helping managers understand the working style team members. This way, they can better manage them and assign tasks that best fit their strengths to get the desired results.

DISC Test for Marketers

Personality tests help individuals choose the most suitable goals in life. You may opt for a test to determine which career option would work best for you. But you may not be aware that this assessment can also add value for business marketing purposes.

If you have a *Directing* personality type, you may be strong-willed, persistent, and ambitious. With a strong mindset and the ambition to take on challenges, you can cross every hurdle and win your sales goals. Marketers with this personality type tend to focus on facts and figures. So, you may emphasize selling points to generate sales for your business and make a good impression on stakeholders through informative presentations.

Marketers with the *Influencing* personality type are good at communicating. They are usually extroverts, can easily impress others with their persuasive style, and find it easier to achieve marketing goals with help from your network. If you belong to this category, you are likely to be a very creative person who frequently comes up with innovative ideas to boost marketing campaigns.

Steady personality type makes a person stable, focused, and patient. Such marketers tend to be detail-oriented and are quite consistent with their marketing strategies. They may take their time in adapting to change and don't get excited with the idea of updating the marketing plan based on its performance or customer feedback.

The fourth personality type *Compliance* makes the marketer completely opposite of the *Directing* personality type. These salespeople are research-oriented and prefer convincing customers to buy their products through a detailed message about the benefits of products. They tend to believe in educating customers about the brand and earning their trust.

Targeting Customers Based on Personality Types

A successful businessperson makes it their priority to understand the needs and wants of their customers. It enables them to choose products that solve a problem and make their lives easier. When it comes to the marketing plan, it's equally important to know who your customers are and what personality traits they may have.

The DISC test gives an idea about personality types and you can choose which ones you

want to target. This strategy is extremely helpful in creating marketing content that can get the attention of ideal customers and build a lasting relationship.

Directing personality customers are interested in facts about a product and brand. They carefully make buying decisions by evaluating its features. Before making a buying decision, they would want to learn about the experiences of other buyers. They may visit your social media pages and ask in their social circle for recommendations. Marketers can make the most of this opportunity and convert them into customers by offering them what they want.

For Influencing customers, the same strategy won't work. They are driven by innovation and show interest in products that stand out. They are usually impulsive buyers who make buying decisions on the go. Regardless of whether or not they actually need it, the customer may purchase a product if an ad or other marketing collateral seems attractive at first sight. When a new product is launched, you may want to target these customers first.

Customers with a Steady personality are unswerving with their choices. They thoroughly evaluate a brand before giving it a try and stick with their choice in the long run if it suits their needs. They aren't much interested in alternative products and are loyal customers. However, it's important to note that it's a challenge to bring such customers on-board in the first place. They may be loyal customers of your competitors and may not show interest in your products unless your market offerings are significantly better than competitors.

Compliance personality suggests that the customer is detail-oriented. Before they make a decision, they conduct a detailed research about every feature and aspect of the product. They may conduct online research and ask company representatives about its specifications before they make up their mind. They won't purchase it until they are fully satisfied.

Which Social Platforms Work Best for Different Personalities

Traditional marketing revolves around mass marketing. When marketers promote products and services through traditional marketing, they consider the needs and wants of the general audience. For instance, if they place an ad in a newspaper, radio, billboard, or TV channel, they are aware that the ad would be noticed by people of all ages. Digital media, on the other hand, offers more flexibility and makes it easier to target specific

audience groups based on demographics, interests, personality types, location, and other criteria.

Social media platforms are arguably the best methods for promoting products these days. They offer unlimited targeting options to ensure your advertisement content reaches the audience that is likely to be interested in the offer.

With so many social media websites available these days, it is quite a task to determine which platform is most suitable for you. The best bet is to determine which personality types you want to target and then choose platforms where those customers are present.

For instance, Dominant or Directing customers prefer Twitter and YouTube for information gathering and entertainment. They also listen to podcasts about their areas of interest. If you want to reach them, you may want to create a business presence on these platforms.

Next comes the Influencer. These people are outgoing and enjoy spending time in crowds. They join Facebook groups and chat with them through messaging apps. They may also be active on Instagram or Snapchat and making an impression on others with impactful content. Furthermore, they are also likely to be on TikTok, making videos for their followers.

Steady customers are old souls and seek stability. They are usually found on Facebook and LinkedIn even though these platforms have lost their charm with time. They believe in staying loyal to known networks and trusted friends. These customers may not be interested in the latest social platforms and stay with their choices for quite a long time.

Lastly, customers having Compliance personality type are less likely to create personal accounts on social media. They are interested in numbers. They may keep track of data and ROI and learn about various analytics tools for fact checking. These folks are often the only people who read the policy and terms of service for each network.

Creating Buyer Persona

Traditionally, marketers relied on buyer persona to streamline marketing efforts. They would create profiles of imaginary customers they want to target. The customer persona document would include detailed information about customers which helped marketers create a specific plan to make the product attractive to customers who fit the criteria.

In this digital era, nothing much has changed and buyer personas are still as effective

as they used to be. Social marketers can better promote their products and convert leads into customers by optimizing the ad or social content as per their preference.

Since there are no rules or standards for generating buyer personas, you need to brainstorm different factors for this purpose. Here are a few aspects you may want to add into the document:

- Age group
- Occupation
- Education
- Income group
- Family size
- Geographical location
- Social platforms they use
- Personality traits
- Social class

You can add as much information as needed to describe ideal customers. However, make sure the profile suits a big enough group since it's not practical to create personas for individual customers.

Aside from creating buyer personas for target customers, it's also recommended to think about negative buyer personas. This profile is for people that aren't included in your target audience or you may want to exclude them from the target customer list.

Exercise:

Take the personality test by Tony Robbins and discuss the results with the class.

THE SURVEY

INSTRUCTIONS FOR RESPONDING

In the space provided below, identify those behaviors which are **MOST – TO-LEAST** characteristic of you in an identified situation. Working left to right, assign “**4**” points to the **MOST** characteristic behavior, “**3**” to the next most characteristic, then “**2**” and finally “**1**” to your **LEAST** characteristic behavior.

EXAMPLE

3 Directing 4 Influencing 2 Steady 1 Cautious

_____ Directing	_____ Influencing	_____ Steady	_____ Cautious
_____ Self-Certain	_____ Optimistic	_____ Deliberate	_____ Restrained
_____ Adventurous	_____ Enthusiastic	_____ Predictable	_____ Logical
_____ Decisive	_____ Open	_____ Patient	_____ Analytical
_____ Daring	_____ Impulsive	_____ Stabilizing	_____ Precise
_____ Restless	_____ Emotional	_____ Protective	_____ Doubting
_____ Competitive	_____ Persuading	_____ Accommodating	_____ Curious
_____ Assertive	_____ Talkative	_____ Modest	_____ Tactful
_____ Experimenting	_____ Charming	_____ Easy-Going	_____ Consistent
_____ Forceful	_____ Sensitive	_____ Sincere	_____ Perfectionists
_____ TOTAL	_____ TOTAL	_____ TOTAL	_____ TOTAL

INSTRUCTIONS FOR COUNTING AND GRAPHING

Total the numbers in each of the four columns. Place the total number in each column in the blank at the bottom of the column “TOTAL”. Check the accuracy by adding all the columns together. When all four columns are added together they will equal 100.

Plot the numbers from the totals columns on page one on the graph below. For example, if the total number in the “D” column was 15, you would place the plotting point (Dot) half-way between the 14 and the 16 on the graph for that dimension.

LEVEL OF ENERGY GRAPH

40	40	40	40
38	38	38	38
36	36	36	36
34	34	34	34
32	32	32	32
30	30	30	30
28	28	28	28
26	26	26	26
24	24	24	24
22	22	22	22
20	20	20	20
18	18	18	18
16	16	16	16
14	14	14	14
12	12	12	12
10	10	10	10

After completing your graph, circle the highest visual point. This represents your strongest behavioral characteristic. The higher you score on the graph, the more intensity you bring to this particular behavioral characteristic. Look at the letter at the graph on page one which corresponds to the highest visual point. Using this letter look up your behavioral style (**D=Dominance, I=Influencing, S=Steady, C=Cautious**)

Personality Styles – ‘S’ = Steady

Description

This person’s tendencies include:

- ◇ Performing an accepted work pattern
- ◇ Sitting or Staying in one place
- ◇ Demonstrating patience

This person desires and environment which includes:

- ◇ Security of the situation
- ◇ Status quo unless given reasons for change

Action Plan

This person needs others who:

- ◇ React quickly to unexpected change
- ◇ Stretch toward the challenges of an accepted task

To be more effective, this person needs:

- ◇ Conditioning prior to change
- ◇ Validation of self – worth

Personality Styles – ‘C’ = Compliant

Description

This person's tendencies include:

- ◇ Attention to key directives and standards
- ◇ Concentrating on key details
- ◇ Working under known circumstances

This person desires and environment which includes:

- ◇ Security assurance
- ◇ Standard operating procedures
- ◇ Sheltered environment

Action Plan

This person needs others who:

- ◇ Desire to expand authority
- ◇ Delegate important tasks

To be more effective, this person needs:

- ◇ To develop tolerance for conflict
- ◇ Opportunity for careful planning

Personality Styles – ‘D’ = Directing

Description

This person's tendencies include:

- ◇ Getting immediate results
- ◇ Causing action
- ◇ Accepting challenges

This person desires an environment which includes:

- ◇ Power and authority
- ◇ Prestige and challenge
- ◇ Opportunity for individual accomplishments

Action Plan

This person needs others who:

- ◇ Weigh pros and cons
- ◇ Calculate risks

To be more effective, this person needs:

- ◇ Difficult assignments
- ◇ Understanding that they need people

Personality Styles – ‘I’= Influencing

Description

This person's tendencies include:

- ◇ Contacting people
- ◇ Making a favorable impression
- ◇ Verbalizing with articulateness

This person desires an environment which includes:

- ◇ Popularity, social recognition
- ◇ Public recognition of ability
- ◇ Freedom of expression

Action Plan

This person needs others who:

- ◇ Concentrate on the task
- ◇ Seek facts

To be more effective, this person needs:

- ◇ Control of time, if D or S is below the midline
- ◇ independence in decision-making

Competition Check

“If you make the opportunity, you’ll be the first in the position to take advantage of it.”

– Biz Stone of Twitter

Competitors are those businesses who offer similar products or services in the same market as yours. For instance, if you sell electronic goods to customers, your competitors will include businesses who also offer electronic items to the same target market. Moreover, businesses that offer substitutes of your offered products are also considered the competition.

With a significant rise in ecommerce stores, it’s easier to tap into global markets. You can reach out to customers present in different countries and encourage them to buy the products through eye catching ads and organic content. This globalization offered a plethora of benefits, but its negative aspect is that it increased competition. Now you don’t only have to compete with business entities that operate in the same geographical area, but also stand out from online businesses present in another corner of the world.

Competition can hurt your business and reduce your market share if you turn a blind eye to competitors’ tactics. You can succeed by monitoring the activities of competitors and building effective strategies to perform better than others. You can learn from them with the help of a thorough competitive analysis report. However, it’s crucial to refrain from spying on competitors or indulging in illegal and immoral activities in an attempt to gain an advantage.

If you are competing with public listed companies, you can easily access their financial performance since the law compels them to publish annual financial reports.

Competing with other established businesses can be a major challenge. However, it’s possible to perform better through a proactive approach. You should focus on research and development and come up with innovative ideas. For example, you may launch an innovative product or service. If no other business deals in similar products, you can achieve the first-mover advantage and earn high profits due to the lack of direct competition.

Types of Competition

Keeping an eye on competitors is the key to survival in the business world. If you are unaware what others are doing, it won't take long before they capture your market share and attract your customer base.

Competition isn't always bad. When you aren't alone, you feel the motivation to keep improving the quality of products and customer service. You also get to learn from experienced competitors who have been in the market for a long time.

In business terms, competition can be divided into three major categories:

Direct Competition

Direct competition is the most common form of business rivalry. It includes businesses that target the same market and offer similar products. If you run a pizza restaurant, your direct competition will include all other pizza joints that operate in the same area.

Some most common examples of competition are Pepsi and Coca-Cola, Target and Costco, Burger King and McDonalds, and Starbucks and Dunkin Donuts.

Indirect Competition

Indirect competition refers to businesses that may have similar products, but adopt a different strategy or platform to reach customers.

For instance, consider that you own a brick and mortar toy shop. Your direct competitor will include similar shops or stores in the same geographical region. But what about online toy stores that also target the same geographical region? They will be called your indirect competition.

Replacement Competition

Your products meet the needs or wants of customers. Some businesses offer products that are different from your offerings, but can replace your products. These are substitutes or alternatives of your products and pose a big threat to your business.

It's not always a simple process to determine this competition unless you're fully aware of the features of your product and understand its pros and cons. When you develop a strategy to differentiate your brand from customers, it's essential to list down replacement products and come up with a plan to deal with these competitors.

Amazon Kindle platform replaced paperback books with eBooks. Therefore, it poses as a replacement competition to traditional book publishers.

Tea and coffee producers are indirect competitors, but these companies compete with fruit juice brands that can replace them. So, fruit juice brands are replacement competitors for tea and coffee companies.

Why Perform Competitor Analysis

Performing competitive analysis assists in identifying your competitors and learning about their business. It's a time consuming process and many entrepreneurs don't find it too important. However, a comprehensive analysis can help you in many ways.

Understand Customer Needs

Businesses often fall victim to market myopia. They focus on the internal expertise or strengths and only consider the firm's perspective. As a result, they ignore changing market trends and fail to understand customer needs.

Competitive analysis is a great way to broaden horizons and explore customer's perspectives. By analyzing the activities and strategies of competitors, you can obtain a fresh perspective and evolve processes with time to stay ahead of the competition.

Identify Potential Threats

A business should always be aware of potential threats and risks. You can perform SWOT analysis to determine threats facing the industry. But competitive analysis is also a must.

With this approach, you can stay updated with what your customers are doing. Furthermore, you can also monitor new market entrants and take the right measures to deal with challenges they create for your business.

Set Suitable Benchmarks

Every business sets certain standards or KPIs to evaluate the performance of different departments as well as the entire organization. Through competitor analysis, you can ensure that your benchmarks suit the current industry trends and make necessary improvements.

Recognize Market Gaps

No matter how saturated the market, there are always some unidentified gaps. Through competitive analysis, you can identify those gaps in no time. Certain market gaps can be filled by offering new products or variants of an existing product. Or you may notice that other businesses don't target specific customer groups.

Imagine that you manufacture furniture. By studying your competitors, you may notice that no competitor specifically currently targets the millennial generation. You can come up with a strategy to sell modern furniture designs to young and first time home buyers to expand your customer base.

Acquisition and Mergers

When you evaluate your main competitors, you may notice that some of them are doing

great and you can learn from their success. However, this won't be the case with every business and you may realize that some of them are likely to go bankrupt in the near future.

You can get in touch with businesses that are struggling to survive. It's possible that an opportunity for acquisition or merger may come up. The difference between acquisition and merger is that the former approach enables you to take over another business, while the latter allows you to combine resources with another business and form a joint organization.

Mergers or acquisitions can help you expand your business. You can make the most of their resources to improve product quality. Furthermore, you can also benefit from their distribution network to tap into new markets.

How to Perform Competitive Analysis

Before you perform competitive analysis, don't forget to evaluate your business. When you understand each and every aspect of your organization, the competitor analysis will prove more fruitful.

Start the process by applying **SWOT analysis**. In this method, you review internal factors including strengths and weaknesses of the company. You also get to explore external factors such as opportunities and threats for the company. With this tool, you can determine the current performance of the business and develop plans to cash in on opportunities and steer clear of threats for business growth.

Another effective method for this purpose is **Porter's Five Forces Model**. Developed by Michael Porter of the Harvard Business School, this model taught businesses that a variety of factors can affect their performance. These factors are as follows:

- **Bargaining Power of Suppliers** - The fewer the suppliers in the market, the more businesses would rely on them. Consequently, they get high authority to increase rates and businesses would have no option but to accept their terms

- **Bargaining power of customers** - When a business has fewer customers, they have to keep prices low to retain them since customers have higher power to negotiate their conditions

- **Existing Competition in the Market** - This refers to the number of existing competitors in the market. The lower the competition, the more they have the power to raise prices

– **New Market Entrants** – It explains the time and resources needed to launch a new business. The easier it is to enter the market, the more efforts will be needed by a business to retain the market share and customer base

– **Threat of Substitutes** – Businesses that deal in products with no close substitutes can increase prices. The higher the number of substitutes, the more difficult it will be for the business to set prices as per their preference

There are several techniques to analyze direct, indirect, and replacement competitors. You can utilize the latest technology and get digital analysis tools to make the task easier. BuzzSumo, SEMrush, Wappalyzer, Brandwatch Audiences, and Searchmetrics are the most popular tools in the business community and help you monitor major competitors online.

Social Media History...How Did We Get Here

Social networking is a necessity for people as they want to share their thoughts with others. Back in the day, social gatherings and events enabled people to meet and communicate with each other. But the advent of the internet in the late 20th century offered modern ways for communication.

The earliest method of delivering messages to people living at a distance was through letters. They trained pigeons to carry letters to the desired destination and return home with a response from the recipient. It often took days for the bird to fly to and fro and deliver a message.

Then came the telegraph technology in the 1830s, based on the Morse technology invented by Samuel Morse. It's a lesser-known fact that Morse code technology was the foundation stone of modern social media. It was a telecommunication method in which the sender transmitted their messages through a telegraph machine in the form of dots and dashes.

Morse code has been used throughout the history for transmission of radio signals. During the First and Second World Wars, the US forces relied on this technology for secure communication. Since then, it has been frequently used by the commercial aviation industry as well as for military purposes.

Radio technology and telephone made it easier to remotely communicate with people. But things took a rapid turn after the invention of the internet. An early version of the internet was announced as early as 1970, but it took around two more decades before a commercial version could be developed. The modern-day World Wide Web came into being in 1990 which paved the way for convenient and efficient communication through innovative social platforms.

Early Social Media Sites

Blogging platforms played a major role in the development and massive success of social

media networking. The first known blog was called Links.net and was developed by a young college student. He referred to this site as Justin's personal homepage.

John Barger is recognized as the inventor of the term "weblog" that was later shortened to "blog" by Peter Merholz. He is one of the founders of blogging technique and wrote informative blogs about artificial intelligence, internet culture, technology trends, and other progressive areas.

Some interactive blogging platforms originated in that era include OpenDiary, Blogger, LiveJournal, WordPress, and TypePad.

While social media gained popularity during the first decade of the 21st century, the first known social website was actually launched in 1997. **SixDegrees** was owned by MacroView and survived only until 2001. It was a unique platform that facilitated users to set up personal profiles, create contact lists, invite friends, and interact with them through short messages. The Bulletin board was another attractive feature for its users. SixDegrees was relaunched a few years later as a private and invite-only platform.

The model was adopted by many other technology companies and several other social websites came out in the early 2000s. Some of these were revamped as dating sites, job searching platforms, and gaming forums. Some examples of such sites include BlackPlanet, Friendster, Xing, Asian Avenue, and Myspace.

Myspace was formed in 2005 and was the first social website to reach 100 million active users per month. They remained the most popular website around the globe between 2005 and 2008. However, their popularity was short-lived and Facebook soon captured their market share. The website is still active, but couldn't regain its former success.

Social Media in the 21st Century

The beginning of the 21st century was the time when multiple social platforms were launched. Almost every year, a new website is launched and older ones gradually lose their popularity.

Let's take a look at some of the most well-known social websites that are used for personal as well as business purposes.

Facebook

With over 2.7 billion monthly active users, Facebook is currently the largest social networking website. It's an intuitive platform where you can add friends, chat via Facebook Messenger, share your thoughts, and communicate with others via a variety of content such as funny memes, live videos, polls, and 360° photos.

Founded in 2004 by a group of Harvard students, Facebook has captured the interest of marketers. Businesses can build communities around the brand through a business page or group. Aside from posting engaging content, businesses can also attract customers through ads with specific targeting options.

This site is popular mostly among Baby boomers and losing the attention of Generation-Z. Also, statistics suggest that most users access their accounts via smartphones.

Twitter

Twitter is a microblogging network where users can write posts of up to 280 characters with a limit of maximum 2,400 posts per day. While it's available across the world, Twitter has the highest number of users in the US and Canada.

Businesses ought to be present here as a majority of people prefer interacting with brands and asking questions through this platform. Furthermore, Twitter users engage with brands more than any other platform and ads offer higher ROI than many other social websites. The key to mastering the Twitter game is by making the most of the right hashtags.

It is popular among affluent people and most users are millennial. As of 2020, 152 million users visit the website on a regular basis.

TikTok

Launched in 2016, TikTok video sharing app soon became one of the leading social apps around the globe. It was merged with Musical.ly in 2018 and has been downloaded over

1.5 billion times by users. Initially, it was popular among the younger generation, but businesses turned to this platform when they recognized its importance.

Whether you run a business or work as a marketer, you can't ignore this useful website especially if your target audience actively uses this app. You can benefit from influencer marketing or create challenge hashtags for promoting a product.

YouTube

YouTube isn't only the second most popular social website, but it is also ranked amongst the leading search engines.

Marketers make the most of this platform for advertising campaigns. It's because YouTube ads bring higher ROI than most other social platforms. However, it's important to remember that the YouTube smartphone app is highly popular and around 70% of YouTube users watch content on their phones.

From how-to videos to product guides, vlogs, online events, testimonials, and employee interviews, you can create different sorts of engaging videos to increase views.

Instagram and Snapchat

Image and video content tend to interest a majority of social media users these days. It's because visual content is easier to consume and doesn't take a lot of time. For this purpose, Instagram and Snapchat are your go-to digital marketing platforms.

With over a billion registered users, Instagram offers you the opportunity to expand the reach of your brand. However, the best way to choose the right platform is by determining where your audience is present. Marketers can reach out to their customers through impactful videos, images, infographics, and stories.

For instance, Instagram has more millennial users while Snapchat is Generation-Z's favorite. Similarly, Insta users earn more than Snapchat users on average.

LinkedIn

Launched in May 2003, LinkedIn is one of the oldest social platforms. It was developed to bring businesses on a single platform where they can network with other professionals.

The platform attracts people with a wide range of professions. Businesses can set up profiles and post vacancies for recruitment purposes. Similarly, working professionals can share experiences with their network and look for job offers.

LinkedIn introduced a targeted ad service for businesses in 2005. The latest features include live video sharing, skill development courses, and opinion polls.

There are many other social and messaging platforms that were developed during the first and second decades of this century. Pinterest, Reddit, Tumblr, WhatsApp, and Qzone are some examples. With the right social marketing strategy, you can effectively build business presence on these websites and expand your customer base.

Blogging Platforms

The rise of blogging platforms in the 21st century paved the way for businesses to increase visibility, interact with the audience, and learn about their thoughts and experiences.

The initial blogging platforms were quite complex, but with technology developments, anyone can create a blog without breaking the bank. When it comes to blogging, there are many options such as Wix, Blogger, WordPress, Tumblr, etc. With these content management systems, it's no longer a challenge to publish informative content for the right audience.

Whether you wish to start a personal blog or need one for business needs, you can easily host it on these websites for a reasonable price. As of December 2020, over 31.7 million people publish blogs in the US alone.

Medium is another reputable online publishing website where registered users can post content for followers and read posts from other authors. It's a great way to produce and promote content and engage with people with similar mindsets. The platform offers different membership plans to users.

PART 2: SOCIAL MEDIA MARKETERS AND MARKETING STRATEGY

Applying Basic Marketing Principles to Social Media Marketing

Before we move forward, let's go back to some of our earlier definitions of marketing. Seth Godin, the founder of Seth Godin Productions and Do You Zoom explained the concept of modern day marketing as:

“Marketing is at the core of what we do. It is the story you tell, who you're telling it to, and why people are going to buy your product or service.”

He also said, “Marketing is no longer about the stuff that you make, but about the stories you tell”.

Social media may be a new technology, but it doesn't mean carrying out marketing campaigns on this medium is a new thing too. Before you think about promoting a brand on social media, you should know about basic marketing concepts. This marketing knowledge will assist you in making the most of social platforms and spread the brand message more effectively.

In Chapter 2, we talked about 4 P's of marketing with respect to traditional marketing concepts. It's time to move forward and explore how the concept of marketing mix is applicable to social media marketing.

Product

When you think of Product in the traditional marketing perspective, the first thing that comes to mind is a tangible product or service businesses offer to meet a specific need of the audience. The concept of product in social media marketing is no different.

You may create a business profile on LinkedIn, get active on Instagram, or launch a channel on YouTube to promote your product and build your brand. Just like other entrepreneurs in the digital world, you can also reach the target audience via social channels.

Before proceeding with marketing efforts, you need to get a clear idea of the benefits as well as negative aspects of your market offerings. You should know how it adds value to

consumers, what the USPs (Unique Selling Points) are, and what makes it different from the competition.

In the digital era, accessing the required information is easy. Customers are woke and socially aware. They prefer brands that not only develop products to meet their needs, but are also conscious about preserving nature while doing so. You can focus on Corporate Social Responsibility (CSR activities) during the promotion phase, but sustainability should be incorporated into the organizational culture.

You need to invest in environmental sustainability and take actions to reduce your carbon footprint. It's best to adopt a green business model through waste management and reducing consumption of natural resources. Furthermore, workforce diversity is also an essential element for businesses these days.

It's not enough to promote the benefits of a product. However, you can gain higher visibility on social media and better promote the products by convincing the audience that you don't only believe in making profits, but are also doing good for society and the environment.

Price

Do you remember the concept of Price in the marketing mix? It's a crucial component of your product marketing strategy and refers to the strategy of setting a price for your products.

The right pricing strategy is important because it's the driving force of the success or failure of a product. If your prices are too high as compared to the competition, then you are likely to lose customers. On the other hand, low prices may cause you losses if they are lower than the cost incurred in developing the product.

Digital or social media marketing has also affected this module. Before the popularity of social networks, business owners had to invest a huge sum in purchasing or renting a location where they could display their products. Customers would visit them and check products before making a buying decision. As a result, the cost of the product would go up by adding utilities, rents, and other overhead expenses.

While brick and mortar stores are still present, eCommerce stores have gained huge popularity and over 24 million businesses are selling products via their websites or social media. The benefit of online selling is that the overall cost is decreased.

Many businesses store products in their warehouses and send them to customers as

they place the order. As a result, you can sell products to customers at a lower price since you need not pay shelf space cost. This way, you can choose the *Cost leadership strategy* and offer products at lower prices to gain a competitive advantage.

Technology has also reduced the need to maintain huge inventory.

The concept of **Dropshipping** evolved with an increase in social media marketing. All you need to do is to contact a manufacturer and work as their fulfillment center. When a customer places an order for products they need, you forward this request to the manufacturer. From manufacturing to product delivery, they will handle every task and you can earn profits with a limited initial investment. Customers are interested in online stores due to convenience as well as lower pricing as compared to in-store prices.

If you visit a supermarket's website, it's possible that their online prices would be different than in-store prices for the same product. One of the major reasons is that the cost of running an online store is lesser than physical stores.

Furthermore, you can also adopt the JIT (*Just in Time*) method to cut down on inventory costs. By implementing an effective communication system within the organization, you can develop products when customers place orders instead of manufacturing them in bulk. With this approach, you can further reduce prices for online stores or customers that contact you through social media pages.

Place

When it comes to 4P's of marketing, Place defines the platforms where customers can find or access your market offerings. Regardless of whether you offer a tangible or intangible product, service, or experience, the rise of social media has certainly changed how you sell products to customers.

Traditionally, in-store shopping was the only option for customers. So, manufacturers were keen on making sure that their products are easily available at supermarkets where their target market shops. They partnered with distribution networks to expand their reach and spread the word. While distribution channel management is still a part of business marketing, digital platforms especially social media websites have added a distinct platform through which a business can sell its products.

Businesses that are active on social media can make the most of opportunities. They can post engaging content to make people talk about the brand, interact with them to learn about their experiences, and respond to customer reviews for further improving customer

experience. Furthermore, customers can contact brands 24/7 through social media and place orders without hassles.

Aside from social media marketing, businesses can also advertise through search engine ads, email marketing, and other online advertising platforms and offer a unique experience to each customer.

Promotion

The importance of traditional marketing can't be denied, but promotional marketing efforts work best when you combine traditional marketing with digital marketing.

Thanks to the modern-day digital channels, especially social media, businesses can now spread the word about their brand through multiple avenues. These platforms aren't only cost-effective, but they also save time and let you reach the targeted audience that is likely to be interested in what you sell.

For digital promotions, social media is the leading choice. Through these websites, you can build lasting customer relationships and convert them into long-term customers by winning their trust. You can run low-cost ads and promote engaging content for this purpose.

Aside from social media marketing, businesses can also advertise through search engine ads. If you manage a business website, it's also a good idea to invest in Search Engine Optimization. This way, your brand will appear in top search engine results and higher visibility may lead to higher website traffic and increased sales.

Lastly, email marketing is another powerful tactic for promoting products. You can attract potential customers through special discounts and Buy-One-Get-One-Free offers.

Activity:

With reference to the Marketing Plan Template, choose a company and product of your choice. You can select your startup or a client's business too. Now apply the concept of marketing mix and answer the questions in the given table for your business.

What's it All For?

So far, we have discussed marketing principles as well as the impact of social media on marketing tactics. You may often hear that businesses ought to invest in social media marketing. With this constant reminder, you may wonder why marketers emphasize social media marketing so much when there are many alternative options available. So, let's dig deep and find out the importance of social media for businesses.

In social media marketing, stories matter more than the product you intend to sell. So, there is no better way than social media posting to tell your stories and spread your brand message.

You can create videos or image content regarding the background of your business, teams, and products. Customer testimonials act as a great tool to capture attention. You can post the right content to build a brand reputation.

A major benefit of social marketing is that it's cost-effective when compared to traditional marketing methods. It's not easy for small and even medium-sized businesses to compete with big names mainly due to limited financial resources. You may hesitate when it comes to investing in advertising or else your expenses may shoot up. But thanks to social media, you can now promote your brand without breaking the bank.

Businesses post on social media to keep followers engaged. The more they are engaged and respond to your content, the easier it will be for you to retain them as loyal customers. In fact, they may turn into promoters and refer your products to their friends if they are highly satisfied with your products as well as customer service.

Paid advertising on social media is useful because of its several targeting options. When you create an ad campaign, you can specify the target audience. This way, you can rest assured that your investment won't go in vain and the ads will reach Facebook, YouTube, or other social media users that have an interest in your offers.

Another exciting feature of social media advertising is retargeting options. Do you visit a website through the browser and then see the ad for the same website when you visit your social profile? This approach is referred to as retargeting.

Social platforms are aware of your online activity. Based on this information, they display ads of websites you recently visited. You can make the most of this feature to advertise your products.

For instance, an internet user may view your eCommerce store and view products.

However, they may not always buy it after viewing it only once. By showing them the ad for the same product at a later date, you can convince them to give it a try. But don't bombard them with the same ad multiple times a day, or else they would get irritated and may end up blocking you. You should use this advertising feature carefully to expand the customer base.

SEO (Search Engine Optimization)

Creating paid ad campaigns is good for promoting your business online. But it's equally important to focus on increasing the organic traffic. The better your website is optimized for search engines especially Google, the more it will benefit your business in the long run.

Increase Website Traffic

Who doesn't want to increase traffic to their official business website? With SEO, your website will appear among the top search results when users search for your target keywords. This will drive more users to your website.

Remember that visitors who access your website through a search engine are likely to be interested in your products or services. If your website offers a good user experience, they would stay around and browse through product categories. Once they find the products they are looking for, they may place the order.

So, we can say that SEO doesn't only increase website traffic, but it actually increases quality traffic that can be converted into customers through some effort.

Decrease Customer Acquisition Cost

Every business aims to increase customers. But you can't afford to do so if the cost of acquiring a new customer is too high. If you don't want to exceed your budget, then SEO is the right choice for you.

It takes time before SEO activities start showing the desired results. But with regular efforts, you can increase visibility through optimization. Since it's much cheaper than paid advertising, you can gain customers at a fraction of the cost.

Moreover, the SEO strategy works 24/7. You don't need to stay online to promote your brand. With a good search engine ranking, potential customers can view the website any time of the day and make buying decisions without the need for salespeople.

Direct to Consumer

Dell is a reputable computer manufacturer that has its customer base around the globe. Initially, they used to sell their products via independent channel members, but they adopted the Direct-to-Consumer model in the 1990s. They eliminated third-party businesses and now sell their systems directly to users.

So, what made them an aspiration for other businesses?

Selling products directly to consumers isn't as easy as it seems. You need to build a strong team that can manage a myriad of operations. You may also have to compete against stores that have been in the business for a long time and have a loyal customer base. You also need to ensure that the product reaches customers without delays.

However, you can adopt this model to enjoy its never-ending perks. Direct selling gives a better chance of establishing relationships with customers. You can know their concerns and suggestions to improve their experience on an on-going basis. Since it eliminates the need for distributors, retailers, and other channel members, you can reduce pricing due to relatively lower costs.

Social media marketing is extremely beneficial to meet this goal. You can promote products directly to consumers through social platforms and deliver orders at their doorstep once they place the order.

PR Brand Awareness

PR refers to deliberately spreading the news about a business with the help of media organizations to build a positive image of the firm.

You can't pay media organizations to assist you in this regard. However, TV channels,

radio show hosts, and popular blog owners contact entrepreneurs on their own that have made their name in the industry. You can also create press releases to inform the target audience about events, activities, and developments within your organization.

PR campaigns are fruitful since they improve customer perception of your business. When the media they trust says good things about you, there's a good chance they would want to learn more about your business.

You should plan events for the well-being of the local community to give back to society. For instance, you may arrange an event to give school supplies to needy kids, arrange charity drives for the poor, or organize blood donation drives. When local newspapers, magazines, and news shows cover these events, you will gain good publicity.

PR efforts not only bring results, but they don't cost anything in most cases. So, if you want people to think about your business, raise awareness about your work, then PR is one of the best options for you.

Lead Generation

Digital marketing helps businesses grab attention and increase customers at a reasonable cost. But in order to achieve these goals, you should rely on lead generation tactics suitable for today's customers.

Lead generation campaigns can be carried out via social marketing, PPC search advertising, blogging, etc. This approach introduces your brand to the target audience. When they know about the products you offer, they may look for your website or social accounts.

These campaigns are good for your business because they let you collect the information of potential customers in a legitimate way. With their consent, you can later use this contact information for email marketing and SMS marketing to share brand details, discounts, and deals with leads to convert them into customers.

Lead generation works best when your audience willingly shares their information with you. You can offer them incentives for this purpose. On the basis of this information, you can engage them via tailor-made content that suits their preferences.

The ROI of Your Mother (Gary Vee said it, not me)

Digital marketing is a must for businesses in this era. It's because around 60% of the world's population is present on the internet. Your competitors are likely advertising on digital platforms and interacting with their target audience via social media. So, you may end up losing these precious prospective customers.

Social media has become a part of our lives. Whether you want to talk to friends or build business networks, social platforms are the way to go. With targeted social ads, you can effectively run campaigns to increase brand awareness, increase traffic to your official business website, convert visitors into customers, or engage the existing customer base. If you want to make the most of these platforms, you can't ignore analytics.

Gary Vaynerchuk, commonly known as Gary Vee is the king of digital marketing. During a corporate meeting, he was enquired multiple times about the ROI of social media campaigns at his company. When the top executive manager kept asking the same question, he gave back with a question of his own: "What's the ROI of your mother?"

While it may seem a personal attack to many, Gary Vee actually raised a great point. Being the marketing genius that he is, he highlighted the importance of context and efforts when it comes to social marketing.

He shared this memory in a 2011 event. At that time, not many tools were present to calculate the return on investment for social media campaigns. He implied that it's not possible to measure the ROI of his mother, but it reflects in his achievements. If his mother didn't encourage him to be his best and boost his self-esteem, he wouldn't be able to reach where he is today. To be precise, it's not easy to calculate the exact ROI of certain things, but it doesn't mean those things aren't valuable.

With time, businesses became more familiar with social marketing and a myriad of tools and metrics are now available to marketers. Therefore, he rephrased his earlier claims in 2015 and enlightened us with the fact that the ROI of social marketing can be measured and it's important to keep track of these performance indicators.

ROI of a tool is directly proportional to the time and efforts you invest in mastering it. For instance, the ROI of you playing basketball may be zero or a few hundred dollars if you bet on games. But a game of basketball will have a much higher worth for LeBron James

considering that he earns over \$39 million per annum salary, excluding sponsorship deals and other income. It is only because he spent years learning the game and investing in improving his skills.

The same goes for social platforms. If you keep investing in social media marketing and build your brand online through aggressive organic and paid marketing, then the ROI will go up in the future.

Increasing the ROI of Social Marketing Campaigns

Social marketing works best when you create long-term goals instead of focusing on short-term benefits. Your marketing campaigns should align with the organization's vision and promote a positive image. Moreover, you should also define clear objectives you intend to achieve with social marketing campaigns. This way, you can increase the monetary and non-monetary revenue earned against these efforts.

Time

Regardless of which business you start, it will take time for the business to become a success. You ought to build networks, create goodwill, expand the customer base, and improve cash flows. Social marketing is no different.

You need to spend a lot of time understanding the social world. Once you have set up business profiles on social platforms of your choice, you have to come up with the right content strategy. You need to learn who your ideal audience is and create content as per their interests. You also need to determine what your competitors are doing differently and learn from them.

Your social marketing efforts may not give much ROI during the initial days or even months. But if you come up with an effective plan, things will start getting better with time. So, keep exploring the world of social marketing and your brand will eventually grow online with time and efforts.

Money

It's a prevalent myth that social media is free. Let me clear this misconception for you. Social platforms aren't free for businesses or even individuals. You spend your precious time chatting with friends and scrolling the timeline when you could have spent it doing more important tasks. So, you pay the price in the form of time.

However, it's important to remember that businesses shouldn't only rely on organic social marketing for growth. Social media ads are extremely helpful in meeting goals. Not only are they relatively cost-effective as compared to traditional marketing channels, but they also offer better targeting options.

Businesses spend millions on social ads, but you can invest in these ads as per your budget. There are a myriad of targeting options available and you can reach the audience based on their gender, location, interests, devices, online activities, behaviors, demographics, and many more specific options.

Furthermore, you can also run marketing campaigns for the audience depending on their buyer's journey stage:

- **Awareness Stage** – Brand Awareness and Reach
- **Consideration Stage** – Traffic, Engagement, App Installs, Video Views, Lead Generation, Messages
- **Conversion Stage** – Conversions, Catalogue Sales, Store foot Traffic

Analytics Tools for Social Media ROI

You can spend significant amounts of time and money in building social profiles and running comprehensive ad campaigns. But how would you know whether your efforts bring the desired results?

The best way to track your social ad campaigns is through analytics tools. You can find various tools and software that provide useful information. With the help of this data, you can optimize your social media strategy and meet predefined marketing goals.

So, here are some of the best analytics tools that may prove the right choice for you:

Hubspot Marketing Analytics

Hubspot Marketing Analytics dashboard offers a unique solution for your social marketing needs. It tracks the ROI of ad campaigns on any social platform, assists you with creating Calls-to-Action that drive results, guides you about the best SEO strategies, and lets you create attractive landing pages for lead generation.

Google Analytics

With Google leading the tech industry, it's no surprise that their social media analytics tool is also one of the best options out there. It is compatible with Google partner platforms including YouTube. You can also integrate it with your business website to monitor website traffic. You can determine how much traffic each social platform directs towards your website and find out detailed information such as engagement, bounce rate, conversion rate, etc.

Mention

Mention is an innovative tool through which you can find out how your brand is doing online. It informs you about discussions related to your brand and lets you know what your customers are saying about you. You can also use this tool to learn about your competitors and take appropriate actions to further improve your social presence.

Keyhole

If your social marketing strategy revolves around Twitter, Facebook, and Instagram, then Keyhole may be the ultimate solution for you. Not only can you explore the performance of social campaigns, but also find out when your target audience is online and how they

engage with social posts. You can also learn about reach, impressions, engagement, and conversion from individual posts as well as the entire ads campaign.

Aside from these standalone tools, you can also utilize analytics dashboard offered by different social platforms. They include Twitter Analytics, Facebook Insights, LinkedIn Analytics, Pinterest Analytics, last but not the least YouTube Analytics.

How to Get Your Business the Most Attention Possible in 2020 | Game Changers Summit Keynote 2019 – YouTube

Every Network is an Island

When you decided to study social media marketing, you must have defined a few objectives. You may be exploring the social marketing world to work as a social media marketer for a business or get familiar with the concepts so you can implement the learning on growing your own startup. At this stage, many people may think “Which social media website is the best option for a business?”

It's a never-ending debate and you can waste your time in the argument. But the simplest answer to this debate is that every network is important. As for the decision of choosing which platform will work best for you; it entirely depends on your goals.

Social websites were developed to serve different purposes. For instance, Facebook brought together people from different parts of the world, LinkedIn facilitated online business networking, and Instagram enabled people of different age groups to capture important moments and share them with each other. So, before you reach the conclusion, it's crucial to understand the benefits of each platform and then decide which website has the highest capability of meeting your business goals.

Who Lives There?

Social media attracts marketers due to its plethora of targeting options. Traditional marketing mainly focuses on mass marketing, but with social marketing you can efficiently decide the audience you intend to target with your marketing campaigns.

Before you launch a marketing campaign, it's essential to set goals. During this goal-setting phase, you need to define what type of audience should view your ads and how they should interact with the business. For this purpose, you should know what kind of internet users you will find on each social platform. So, let's learn more about the audience on popular social media websites.

Facebook

Facebook is populated mostly by adults of 25-34 years age group. The second largest group is 18-24 years who make up 23.8% of Facebook's population and only 4.8% of users fall into the senior age group. The biggest country present on the platform is India, while users from the US and Canada are only 10% of the total Facebook population. As for gender, males dominate the platform with 56% of the total population. Also, 51% active users visit the website several times a day and 75% of Facebook users are at least college graduates.

Twitter

With 500 million tweets sent every day, Twitter is one of the busiest social platforms. Talking about age groups, 25-34 year olds make up 28.9% of total users, while 35-49 year olds are 28.2% of total users. Lastly, the smallest age group on Twitter is 13-17 years with only 9.1% of share.

80% of users are affluent millennials from all around the world who use the website to get information. Most users come from the US, Japan, India, and Brazil respectively. As for businesses, \$913.8 million were spent on ads in 2019. Furthermore, 93% of Twitter users engage with brands by retweeting their posts or sharing their thoughts and experiences about brands of their choice.

Instagram

On Instagram, the highest population is of 25-34 year olds who make up 33.1% of all users and age group of 18-24 years is second with 29.6% share. Most of them come from the US, whereas India and Brazil hold second and third positions respectively. 43% of these users are college graduates and 42% earn over \$75,000 per annum.

Over 510 million users are females and males are behind with a difference of 20 million. These users spend around 28 minutes a day on Insta. Most users follow at least a single

brand on the app and 73% of teens in the US find Instagram the easiest way to reach and interact with a brand.

TikTok

TikTok is a customer favorite app and stands second among the most popular free apps of 2019. Its users are present in 141 countries while China, India, United States, and Turkey are among the countries where it is more frequently downloaded and used.

44% TikTok users are females and 56% are males. Out of these, 41% users are aged 16-24 years who spend at least 52 minutes every day on the app, watching videos related to entertainment, dance, pranks, fitness and other categories.

90% of TikTok or Douyin users access the app via Android smartphones and maintain a healthy engagement rate of 52%. In 2019, people spent \$115.3 million on the app for in-app purchases, influencer marketing, etc.

This was a brief overview of some popular social platforms. You can opt for the platform that suits your business needs.

What Language Do They Speak?

Whether you're talking to friends in a party, communicating with little kids in social gatherings, or sharing thoughts with business associates in a professional setting, you should always be aware of your audience. When you choose the language or tone they understand, you can conveniently communicate with each other without misunderstandings.

Don't forget this rule when communicating with your audience on social media. Creating a profile on social websites is easy. What's difficult is to spread your message and get people talking about the brand in a positive manner. However, this objective can be achieved by determining what type of content the audience prefers and creating posts accordingly.

Hashtags (#)

Hashtags were introduced by Chris Messina in an attempt to organize content on social media. Twitter platform first introduced this unique feature in 2007, but it was later adopted by Facebook, Instagram, YouTube, Pinterest, and LinkedIn due to its usability.

A hashtag categorizes content on the basis of topic. If you want to reach the right audience for your business, you need to target popular and relevant ones. Moreover, you can also create custom hashtags to promote your products.

Let's discuss this concept with an example. Imagine that a roofing service provider hires you as a social media marketer. To build their business online, you need to come up with suitable hashtags for the social marketing strategy. Here are a few trends and hashtags that may prove useful:

#roofing #roofingcontractor #construction #greenroofing #roofrepair #roofgutters

Long Form vs. Short Form Content

The internet users tend to have short attention spans. They easily get distracted and can ignore your posts if they don't find it interesting. This is why content marketing in digital media focuses on captivating and concise content that can keep readers hooked till the last line.

If we need to keep the content short, how can we share important information or news with the target audience?

It's common for social media marketers to get confused about the length of content. But you should remember that the content length depends on the interest of your audience as well as the platform where you intend to post it.

If you are planning to set up a company blog, it's best to opt for long-form content. The purpose of blogging is to educate people about a relevant topic and offer comprehensive solutions to problems. For example, if you are an expert in providing electrical installation and repair services, you may want to write posts about safety tips for customers. Blog posts can be 500-1,000 words, but you should aim for publishing blogs of 2,000-2,500 words to boost SEO score.

LinkedIn is also suitable for posting long-form content. You can write about your area of expertise and experiences to share knowledge with other professionals.

Other social platforms such as Facebook, Twitter, Instagram, etc. may be suitable for short-term content. Whether you are thinking of creating text posts, videos, or images, it's a better option to keep the content short for better engagement.

Also, don't forget that long form videos aren't compatible with most social websites. Instagram supports videos of up to 15 seconds. So, if you are creating long form informative videos, it may be a good option to post it on YouTube and share a brief snippet on Twitter and other social websites. Your followers who find the topic interesting will visit your YouTube channel to watch the entire video.

What's Their Favorite Dish?

Back in the day, social media marketing was all about text posts and still images. With technology advancements, a wide variety of content is now available to internet users. Let's first take a look at the most popular types of digital content. After that, we will discuss which content goes well with popular social websites.

- Blogs or articles
- eBooks
- Images (still images, GIFs, 360° images)
- Videos (recorded videos and live streaming)
- Infographics
- Testimonials
- Contests
- Polls
- Podcasts
- Webinars
- How-to guides

Instagram is an image-based platform. To promote your brand, you can share high-quality images of products, team members, as well as stills from networking events. Adding relevant captions and hashtags is also essential. A similar strategy is suitable for **Pinterest** where you can capture attention via images.

As for **Facebook**, videos perform far better than any other type of content. This includes

live streams as well as processed images for coverage of organizational events. You can also post videos developed with the aim of advertising on your Facebook page.

With the increasing population of **TikTok**, you shouldn't ignore its importance in the marketing plan. You can complement videos with captions and can include links to your website to increase web traffic.

Twitter network is known for its credibility when it comes to news and information. Users of this platform show more interest in professionally processed content which includes informational infographics and videos.

For **LinkedIn**, you can turn to long form articles, user guides, and eBooks to increase engagement. We all know **YouTube** is one of the most popular video streaming websites. So, you can post videos on this platform regardless of their size or length.

What Network is on Now?

Digital marketing strategy plays a critical role in business growth. With the right strategy, you can raise brand awareness, attract the target audience, and build lasting relationships for a win-win situation. However, your marketing efforts can prove fruitful only if you understand how to use social platforms to your advantage.

Social media has become a part of our lives. Successful marketers put themselves in customers' shoes and choose a strategy that focuses on their pain points. If you want to increase the efficacy of your digital marketing campaigns, you need to learn about popular social media websites.

While a myriad of social media websites is available these days, you can't promote your brand on each and every website. By focusing your efforts on websites that are popular among your audience, you can drive results.

Why Do You Want One to Win Or Lose?

Myspace got the first-mover advantage and remained the leading social website for quite some time. However, when Facebook was introduced, it captured a huge market share in no time and left other social media websites struggling with their loss.

When an innovative company is launched with the right strategy, it has a good chance of eliminating the predecessor and becoming the market leader. In the past, we have seen many such examples. Netflix beat Blockbuster, digital camera companies killed Polaroid, and Circuit City lost to Best Buy.

This is a common trend that old and established businesses lose to new market entrants. It is because many traditional stores prefer to stick with the strategies and actions they have been using for years and fear change or innovation.

This practice isn't good for anyone; neither marketers nor consumers. If there is no market competition, consumers would suffer the most.

Higher competition eliminates the monopoly. The more firms in the market, the more efforts would be needed for a business to make its place in the crowded market. They are motivated to innovate and offer value to consumers to stand out. It keeps them on toes

and they constantly put in their best efforts to stay ahead and stay relevant. Similarly, they are also inclined to offer better quality goods and services at reasonable prices.

Now, let's consider the example of social media in this scenario. It's best for everyone that the competition is increasing amongst social media companies. The more the competition, the higher will be the service quality at lower rates. So, whether you use the internet for personal networking or you are a business marketer, this competition will benefit you in the long run.

How Do We Benefit From Each Network?

Investing time and money in social media is no longer optional for business marketers. With your competition gaining customers and building a good reputation via social websites, you can't afford to miss out on this invaluable opportunity.

As marketers, your first step should be to get a website where you can display products, testimonials, and other relevant information. After that, you can gain several benefits from social accounts.

Regardless of which platform you choose, you can raise awareness via social posts as well as paid social media advertising. Your social posts should include a CTA that guides users about the next action. For instance, if you post a special discount for your social media followers, you ought to add the link to the online store where they can redeem it.

Customers tend to trust businesses that have a transparent system. Not only should you share detailed information about your business, but also share accurate pricing and terms and conditions. With this approach, you can earn their trust.

Many customers post reviews about their experiences with a brand. When a satisfied customer posts a positive comment, you should respond to them. However, it's equally important to respond to negative comments. When you take action quickly to solve their problems, your popularity and sales are likely to elevate.

What's Hot Right Now?

Being a marketer, you should be well-aware of current market trends. It will help you stay relevant and update your marketing strategy accordingly to reach your audience. On

the other hand, if you don't know which social media marketing channels are the most popular, you may lose customer attention before you know it.

With people confined to home due to COVID, the use of the internet, especially social media has significantly increased. A majority of people interact with their friends and families via social media. The use of digital media and social platforms for business purposes has also become the norm. So, you need to know which platforms are hot these days and which ones are losing popularity.

The trends for 2020 are out now and marketers can develop a strategy for 2021 based on these statistics. Here is a list of top social websites along with the number of active users on these sites.

- Facebook – 2,701 million
- YouTube – 2,000 million
- WhatsApp – Facebook – 2,000 million
- Facebook Messenger – 1,300 million
- WeChat – 1,206 million
- Instagram – 1,158 million
- TikTok – 689 million

If you don't currently use the aforementioned sites for marketing purposes, it's time to go through your social marketing strategy again and revise the strategy to adjust to these trends.

Let's Explore

Whether you are promoting a new business or working with a business that has been in the industry for a long time, you need an effective marketing strategy for social channels.

In social marketing, there are no rules and standards. You can't follow specific rules that guarantee to meet objectives. The best way to succeed in the social media world is to adopt the trial and error technique. You should come up with a plan to promote the brand and execute it on social channels of your choice. If it brings you the desired results, then it's great! But there is a good chance that social marketing efforts won't always prove effective.

Despite your efforts to boost awareness, gain customers, or generate leads, your social

strategy won't always work. This is why it's important to have a contingency plan. If the first plan doesn't get results, you should adjust it based on the performance metrics.

The good thing is that there are several options available for marketers. If Facebook doesn't work, you may turn to LinkedIn for the next campaign. You should set clear objectives, choose the right platform that meets your criteria, and measure performance after the execution of the social marketing plan for making your social marketing campaigns fruitful.

Content Speaks

Social media and content go hand-in-hand. The purpose of creating social media websites was to provide users a platform where they can interact with each other and share information. Being a marketer, you can't ignore the value of content. Hence it goes without saying that you need a content marketing strategy for social platforms.

Many companies post content on social websites without a documented strategy to back their actions. A well-documented strategy and plan streamlines actions and guides you in the right direction. It helps you stay on track towards long-term and short-term goals and get heard.

To create an effective content strategy, ask yourself the following questions:

- What are my goals?
- Who should I post content for?
- Which platforms would work best?
- What type of content is preferred by my audience?
- How often should I post content?
- Which KPIs should I use for measuring performance?

Creating Your “Voice”

Brand voice is the distinct personality of your business that sets you apart from the competition. It creates an image or perception in customers' minds. If you promote a positive message through a captivating brand voice, then it won't be difficult for you to achieve social media marketing goals through your unique brand voice.

On social media, you can attract the audience through storytelling. Your stories should portray a consistent image to build credibility. For instance, if you are an optimistic person in real life, you notice the positive aspect of every event and don't linger in the negativity. Similarly, if you intend to portray your brand as adventurous, energetic, inspiring, or trustworthy, you should choose a tone that portrays this image and be consistent.

Customers consider the brand image of a business before they interact with them or

make buying decisions. If your brand voice is intimidating or you often post controversial content, then you may end up losing them to more stable and friendly competitors.

Where to Find the Right Content?

Creating fresh content takes time and effort. If you engage with your audience on multiple social websites, it won't be easy to generate unique content for every platform especially when you need to post content on a regular basis. Amidst the coronavirus outbreak, getting new ideas and creating unique content has become even more difficult. This is when content repurposing comes into the picture.

It's a good idea to look at content generated by other social media users. You can get to know about the latest trends and get ideas for your business. An example is that you can work on some DIY projects and record the procedure via a time-lapse video to engage the audience.

You may have created some evergreen content in the past. Go check your social profiles and locate posts that can be reused. For example, you may find images posted on Pinterest or Instagram from previous vacations. You can create blog posts about your experiences around those images and post them on your blog. However, when repurposing the content, make sure it goes well with your brand voice and the general language of the specific social website.

You should also consider creating content around the products your business offers. You can create whitepapers to share detailed information about the product or process. It's also a good idea to complement it with a how-to article or video to educate customers.

Content repurposing works great when you understand your weaknesses and strengthens. If you aren't good at talking in front of a camera, then creating videos for social media may not be your best bet. Stammering out of nervousness portrays a negative image. You should rather choose platforms that go well with your personality and can help you promote your entrepreneurial venture.

Now that the world is moving towards online business, e-conferencing has become a norm. You can conduct business meetings as well as events via Zoom or other digital platforms. You should consider recording such online events and posting them on social media.

How to Create the Right Content?

As a marketer, you can learn from social media trends popular among other business people. Event marketing has become quite popular these days where professionals meet and communicate with each other about topics of mutual interest. These events provide you an opportunity to create engaging content for your social media audience.

You should consider recording these events and posting them on social media for the followers. You can record videos via any device, but you may wonder whether it's better to share live and unprocessed videos or should you process them first before posting on social media. I would say both tactics can work in your favor.

In the case of live events, social media users expect to enjoy live coverage of the event. If you don't want them to miss those golden moments, you should live broadcast the event on your social media pages. Facebook Live feature comes in handy for this purpose.

Back in the day, it was believed that brands may suffer if they share unprocessed video content with the audience as they are less attractive to viewers. But this isn't the case anymore. People don't mind this approach because they are aware you may not always have professional equipment at hand when attending a business event. Moreover, people today are more interested in authentic brands. Overly processed content leads to question marks on authenticity, which is why live videos should be added to your social media content strategy.

It's also important to remember that posting live videos doesn't mean processed and professional quality videos aren't important. You can share the event live and process captured images and videos for later use. With this professional content, you can promote the brand, product, or event on an on-going basis. So, we can say that a combination of raw/live videos and processed videos works best for many businesses.

What Tools Do You Need?

Social media content creation may seem a difficult task but it's no rocket science. You don't need to invest a huge sum in buying equipment and tools to create the right content.

Many marketers avoid generating video content for social media because they don't own professional equipment. However, you don't need highly professional cameras to record videos. It's perfectly fine to use a smartphone camera, digital cam, or GoPro for capturing

events. But it's recommended to get a portable tripod to ensure captured videos are stable and clear.

In the indoor environment, you may need to arrange lighting equipment. However, outdoor events can save you from this trouble too. Also, don't forget to get a microphone to record audio along with the video content.

If you intend to share it live, you need not process it to enhance quality, but it's important to edit and process them for professionally posting them on LinkedIn and other platforms.

There are many video editing software available that you can learn to use. However, it is a complex process that is best left to professionals. To find qualified professionals, you should visit [Freelancer.com](https://www.freelancer.com) and [Upwork](https://www.upwork.com) websites. These are popular freelancing platforms where you can hire professionals on a project basis or an on-going as per your needs.

The Caption Game?

Posting images and videos on Instagram and other websites isn't enough; you should complement it with captivating captions to increase engagement. Its length can vary, but Insta supports captions of up to 2,200 words. The shorter the text, the more effective it will be.

For your persona profile, you may add a quote that comes to your mind. But business branding shouldn't be done this way. You should write a concise caption that represents the brand personality and resonates with your followers.

Writing long-form captions can work for brands as long as they aren't boring. If you want to adopt this method, always remember to mention important phrases or words at the beginning. This way, when the post is truncated, users will still be able to get the information at a glance.

Aside from the descriptive text, you should also add the most appropriate hashtags to increase visibility.

What's the Hashtag?

A hashtag is a combination of letters or numbers that represent a specific topic. It's helpful for users because it helps them organize content and view posts based on their interests or the latest trends. You can follow hashtags that attract you the most so as to easily access information about that topic.

These hashtags are widely used on TikTok, Instagram, Twitter, and many other popular websites. As a marketer, you should up your game and master the art of creating and using the right hashtags to better promote your brand and products online.

You can use an existing hashtag or create a new one around your business or business event. On TikTok, brands often create viral challenges and come up with suitable hashtags for these challenge videos. You can follow in their footsteps and create a challenge of your own to get customer attention.

You can brainstorm to come up with innovative hashtags for business marketing, but hashtag tools can simplify this task for you. It's recommended to explore Hashtagify, RiteTag, Trendsmap, and AutoHash to master the art of hashtagging.

Ask Your 8-Year-Old

Social media strategy gives the desired results when it's focused on the needs of target customers. So, brands that create content that attracts their followers tend to get more views and can maintain a good conversion rate.

The population on social media is constantly increasing and more and more youngsters are creating profiles on social media. Therefore, the best way to understand what kind of content these people need is to get the opinion of kids and teenagers.

These youngsters are well-equipped with modern technology and understand how to use almost any platform. They can guide you about the content that attracts this young generation and even give you unique ideas to make your content more engaging.

With the help of these insights, you can develop a plan to increase the engagement rate and convince the audience to take action.

Is that Wrong? The Ethical Question in Social Media

Remember when Adidas faced a backlash by tweeting the following message to participants who completed the Boston annual race in 2018, due to its reference to painful Boston bombings at the 2013 event?

“Congrats, you survived the Boston Marathon!”

Or when the skincare company, Nivea, posted a social media ad emphasizing that “White is Purity”?

Many businesses grab the headlines from time to time due to a simple mistake on social media or due to their inappropriate posts. It’s a growing concern among social media users and can bring negative publicity to businesses.

Before you post content on social media, make sure it’s free of profanities, culturally inappropriate language, racism, or other negative aspects that can cause controversy. You need to respect everyone regardless of their beliefs, ethnic background, financial status, or sexual orientation, and create content that doesn’t harm anyone’s feelings. With an ethical approach, you can effectively promote your brand and build a positive brand image.

Am I Famous Yet?

Social media marketing is a cost-efficient yet effective way to promote your products and reach out to the audience. A common mistake made by some marketers is that they post content and ads on social media for a few days and opt out of social marketing if the posts go unnoticed.

There is no doubt that social media websites have become the leading platforms for marketing purposes. However, it doesn’t mean that your brand will suddenly become popular in a few days.

Nowadays, a majority of businesses rely on social media marketing. Under such circumstances, you can’t expect to become the market leader within a week.

What you need to do is to be consistent with your effort. During the initial few weeks, your social marketing campaigns may not do that great. However, you should follow the marketing strategy without losing hope. Furthermore, monitoring the performance of the

campaign is also essential. It can guide you about what you are doing right and which areas of your social marketing need to be changed.

With this approach, your social marketing efforts will bring results in time and can become the customer choice through constant efforts.

Time Management

Social media is a great tool for promoting your business without breaking the bank, but it can become a nuisance if you aren't careful. Working as a social media marketer can be a tough job if you constantly feel the urge to scroll the timeline every now and then.

Furthermore, social marketing tends to be a time-consuming task. Without an effective plan, you will end up wasting time and won't be able to achieve your goals.

A major reason why marketers fail to use social media to their advantage is that they try to be on every social network. This is neither possible nor a good idea. Regardless of whether you work on your own or have a social media team, it's important to choose social websites that fit your goal. This way, you can save precious time by putting your entire focus on social accounts that can increase website traffic and generate results.

Another challenge for social marketers is to stay focused on work when logging into social media accounts for job-related tasks. You may soon find yourself checking posts and messages from other users. The best strategy to tackle this issue and manage time is to set time limits for every task. For instance, if you need to post a tweet, you should specify the time needed for the task. With the deadline approaching, you will be motivated to prioritize work and avoid indulging in time-wasting activities.

When you are responsible to manage multiple social media accounts, it's not easy to keep track of the password for each account. You can neither write it down on a piece of paper due to security risks nor use the same password for every account.

The best way to avoid wasting time looking for passwords is to use password management software. These tools save credentials in a safe way and enable marketers to log in to different accounts without an issue. Moreover, when you need to check social media profiles via any other device, all you need to do is to access your password manager account and it will provide you access in no time.

Practice Safe Scheduling

Behind every successful job is plenty of planning. To succeed as a social marketer, you need to plan the actions you need to take for running marketing campaigns.

Your priority should be to get a content planning calendar for your business. You can easily find a template online or design a calendar that best fits your requirements. With the help of this tool, you can specify the content that needs to be posted across platforms.

In organizations, social media marketers usually plan content for a month in advance. You can make slight changes to this calendar on the go based on current events. You can decide the theme of the day or week and plan which type of content should be posted on different platforms throughout the month. This practice makes sure you can regularly post content for business promotion. If you work with a team of social media marketers, it will be easier to keep them in the loop.

When you track the performance of social media campaigns, you will get to know when the majority of your audience is online and can post content accordingly. But what if that time slot isn't during standard business hours and you can't log in at that particular time? This is when scheduling tools will save you from trouble.

SocialPilot, HootSuite, Post Planner, Feedly, and other similar tools can be used to schedule social media posts for a later date or time. You won't have to worry about forgetting to post content and the software will take care of this task.

That's Embarrassing: Don't Let Your Scheduled Post Land at the Wrong Party

Scheduling social media posts via software can make things easier for you and boost productivity. However, this method isn't fool-proof and can lead to embarrassing mistakes if you aren't cautious.

Some brands become the talk of the town in a negative way when they accidentally post content with unintentional profanities. Sephora once created a hashtag “#C**tdownToBeauty” when they actually wanted to use the hashtag #CountdownToBeauty. This mistake can happen when you schedule a post for later without proofreading it. It's ideal to update settings for filtering out unethical phrases and words.

US Airways and a few other businesses caused controversy in the past when they accidentally attached highly explicit images or links to pornographic websites. These mistakes can happen due to minor carelessness, but can attract significant negative publicity which isn't good.

You don't want to fall victim to such craziness. So, it's best to carefully check and recheck the post before you schedule it for later.

When you manage content for multiple social platforms or working as a social media marketer for multiple businesses, there is a higher risk of making mistakes. For instance, you may want to schedule a post via software for Twitter, but accidentally do so for another website. While this mistake may not appear insignificant, it can promote a negative image of your business.

Lastly, it's a good idea to create social media posts for prominent occasions, events, and festivals, but make sure you schedule it for the right time and date. What if you create an Instagram post for Halloween, but due to the scheduling mistake, it gets posted a day or two after the holiday? You may become the laughing stock for the audience.

If This, Then That? Social Media Automation

If-then concept is a basic principle of computer programming where you specify the system to check for the defined condition and execute the specific block of code only if it meets the condition. IFTTT platform was developed with the intention to provide similar functionality to social media marketers.

This platform allows marketers to create applets for automated content. You can create posts for suitable social websites and specify the trigger point. When the specified action is triggered, the post applet will be published.

However, using the IFTTT model may not be your best bet when it comes to comments. Some businesses use bots to post automated comments. These comments don't only seem fake, but they also portray a negative image of the company.

Alternatively, it can be used to improve customer service. For instance, you can use this model with a messaging app to facilitate customers. You can specify answers to most common queries that are frequently asked.

For example, when a customer enquires you about your working hours or the prices of your products, they can receive an automated answer to their query. This practice saves time and provides answers to customers without unnecessary delays.

Although automation can make your job easier to some extent, it never works for marketers to create a post and then forget about it. As a result, it may get published at an inappropriate time and seem irrelevant. You should go through the scheduled content from time to time and tweak posts if needed.

Analyze That

If this then that is a valuable automation tool. Not only does it enable you to automate social media posts for business promotion purposes, but you can also use it for personal reasons. For instance, you can use this tool to wish colleagues on their birthdays or work anniversaries.

However, this functionality should be used carefully. This tool posts the same content every time an event takes place. In certain cases, this may get out of hand.

When an existing or potential customer messages a brand, they often receive an automated message where they are addressed with their first name. This may cause an embarrassing situation for businesses in some cases. A few years ago, a brand used this function on Twitter where they were addressed with their user name. But the user had previously changed their profile name with a profane and the tweet made the brand look bad to other users.

Such events aren't common and don't happen too often. But they can lead to an embarrassing situation for your business and may deter the customer base. So, before you opt for the IFTTT model, you should evaluate your decision and come up with suitable content that is less likely to lead to controversy.

We're Engaged! Aren't We?

When you create business profiles on social media, you may aim to increase the number of followers through content marketing. Increasing your follower base is certainly important for your brand, but you should also focus on increasing engagement for long-term benefits.

Social media engagement refers to likes, comments, and shares on posts by other social media users. Not all of your followers are active and many of them may forget about you after liking your page on Facebook or following you on Instagram. In this sense, engagement is far more impactful since it indicates that your followers not only see your posts, but also interact with you one way or another.

The phrase *out of sight, out of mind* is certainly true and is applicable in the scenario of business marketing. With the internet making it easier to reach a global audience and promote and sell products without hassles, more and more businesses are entering the market and leading to increased competition. If your content reaches them and captures their attention, they would stay with you provided that your products and customer service meet their needs. But it won't take long for them to switch to your competitor brands if you ghost them and your content stops reaching their social media timeline.

If they often interact with your brand, the social media algorithm would show them your content on priority and ensure that they remember you. Therefore, not only should you create engaging content, but also monitor the engagement rate.

There are many different tools available that can help you keep track of customer engagement on social media including Twitter Counter, Buzzlogix, Zoho Social, and Agorapulse that can help you monitor the engagement rate as well as brand reputation across social platforms.

What If They Don't Talk Back?

Customer engagement is a key concern for brands. The more customers interact with social media posts, the more impact your business makes in the market. This is a good sign

because engagement is the driving force of ROI and makes the business profitable down the road.

However, even though business marketers try their best to attract the target audience and encourage them to like or comment on their posts, they are not always able to achieve this goal. This situation is troublesome and can make you wonder why your entire efforts are going in vain.

To get the answer, you should first analyze your current social media strategy. It's possible that your content is of low-quality or doesn't interest your audience. It's also a possibility that your choice of social website isn't right. With this detailed analysis, you may find out potential issues with your strategy and revise it to address those issues.

However, it should also be noted that defective strategy isn't always the cause of low engagement. You may need to develop more interesting content to capture the attention. It may be a good idea to hold live Q&A sessions.

Customers are no longer interested in listening to faceless brands. They rather find the human side of brands more attractive and engage with them on social media. By introducing them to your team and interacting with them via live sessions, you can win their trust and increase engagement.

Customer-generated content can also help you in this regard. You shouldn't only create and share your own content, but also retweet, or like, or share relevant posts by followers. For instance, if you find an interesting post of your followers discussing the niche or topic related to your business, you should consider sharing it with your follower base.

Influencer marketing can also be a good option. You can get in touch with social media influencers who have built a community of followers and ask them to promote your brand. When they endorse your business, their followers will visit your social profile and may engage with the content if they find it interesting.

Should I Still Use Email?

Some people claim that email is a feature of the past and has lost its importance over time. However, digital marketers are well-aware this statement is far from the truth. Despite the popularity of other online marketing methods, email promotions are still extremely effective.

Most consumers check their emails on a daily basis which is why there is no better way for marketers to share information about their market offerings and latest product

launches. You can send newsletters to customers and leads and invite them to read the latest blog posts, visit your social media, and learn about what's new.

Email is relevant in the era of social media because it is a helpful tool for increasing website traffic and generating or capturing qualified leads. You can also curate content and send customized information to customer groups as per their interests. This targeted information can help in building strong relationships and entice customers to interact with you.

Once they are directed to your website to get more information, there is a good chance they will go through the list of products you sell and purchase them soon.

What If They're Upset

Businesses that value their customers work extra hard to provide them an unprecedented and memorable experience. However, they may not be able to achieve this goal every time. Despite your best efforts, some customers may still be unhappy and dissatisfied.

Unhappy customers often post negative reviews about brands on social media pages or Facebook groups. If you notice such a review, you should get ready to resolve the situation instead of losing your cool.

You should calmly listen to customers and apologize for the mistake. If it was a genuine problem, then you should empathize and assure them that the management would look into the matter and resolve the problem at the earliest. You can also send them a gift or discount voucher to make up for their bad experience.

Some customers may accept your apology and let it go, but some customers get too angry and they don't listen to social media managers. They may continue posting negative reviews about your business and hurt your brand reputation.

In this scenario, the best strategy is to use tracking tools like Mention that keep you updated about discussions and reviews about your business. With this real-time information, you can tackle the situation and spread positive messages about your brand to prevent them from further hurting your business.

Don't Feed the Trolls

Some angry customers post negative reviews because they genuinely faced a bad experience with your company. But remember that some social media users deliberately post provocative content against other users and businesses out of habit.

They poke fun at others and humiliate them with derogatory content. Interacting with such trolls and responding to their comments can further ignite the situation. So, you need to tactfully handle the situation.

First of all, write terms and policies for your community where followers are expected to be respectful of others and refrain from using offensive language. You can politely ask trolls to be mindful in the light of community policies. You can respond to fake posts regarding your business with facts or ignore them. You can also come up with witty responses to diffuse the situation.

However, social media trolls don't go away easily and they may keep trying to instigate you. Don't get into the trap and stay calm and respectful to protect your brand image.

Do the Hokey Pokey: Turn Complaints into Gold

Brands that often receive negative comments and reviews tend to lose customers and damage the reputation. But customer complaints and negative comments aren't as bad as they are perceived.

These posts give you a chance to identify and recognize your mistakes. Your business processes or products may be harmful in some manner or fail to meet the needs of customers. Instead of treating these comments as trash and ignoring them, you should treat them as feedback and make the most of this constructive feedback to enhance service quality.

If a customer points out that the behavior of the staff wasn't good, you should pay attention to them. Offering excuses won't do good as it gives the impression that you don't consider customer complaints important. You can rather arrange training sessions for team members to help them boost their skillset and improve service quality.

You should encourage customers and social media followers to offer suggestions for further improving your business processes. Also, once you implement a customer suggestion, you should post it on social media and appreciate customer feedback.

Do You Even Care?

Customer service is a challenging job. You need to listen to customer complaints and suggestions, and bear their anger while taking the blame for intentional or unintentional mistakes.

No matter what type of business you manage, effective customer service is the key to success. You should always prioritize customers and work hard to add value to them. Similarly, listening to and addressing customer issues is equally important for a business.

Customers are now aware of their rights and they don't want to do anything with businesses that ignore them. To become an effective business leader or social media marketer, you ought to care about your customers. You don't want to receive negative reviews due to the negligence of your team. You should develop a culture within the organization where staff members consider it their first and foremost responsibility to take care of customers and leave no stone unturned in achieving customer satisfaction.

This approach strengthens relationships with customers and creates a lasting bond.

Social Media Jobs. Why Understanding Basic Marketing Principles Will Put You Ahead of the Rest

It's a prevalent myth that social media management is all about mastering different social media websites. The better you are with using the latest technology and creating and posting content across social accounts, the more successful you will be along the journey.

However, social media management is more about marketing than using social accounts. Therefore, you ought to grasp basic marketing principles. If you understand basic marketing concepts, you can stand out and do well as compared to other candidates.

The evolution of technology has offered a variety of platforms to marketers, but marketing principles stay almost the same. If you know marketing, you can apply these principles to promote a brand online and generate results.

The Intern Always Gets Blamed

At the beginning of your professional journey, you may need to work as an intern to get experience, increase knowledge, and learn useful skills alongside experienced professionals.

The internship is a rewarding yet challenging job. You get the opportunity to gain plenty of useful information, but the tasks can be never-ending. Moreover, if anything goes wrong, there is a good chance you will be blamed for the mistake as the junior-most staff member in the organization.

It's a part of the learning journey. You need to be headstrong and accept feedback without getting angry. This knowledge will help you when you start working as a regular social media management employee and can use this learning to your advantage.

How Boring is Your Resume?

When you apply for a job, the resume is your first introduction to potential employers. They decide whether or not it's a good idea to interview you for the job based on this professional document. If it's too boring, lacks information, and doesn't highlight the information they are looking for, you can already say goodbye to that internship opportunity you have been dreaming of.

Recruiters evaluate your skills, personality, strengths, and qualifications with the help of your resume. So, you can't ignore the importance of this document. If you have got rejected by recruiters or afraid that recruiters may not consider your application, then it's a good idea to update and redesign your resume.

It's best to invest in an attractive resume design that highlights your skills, qualifications, experience, and personal strengths. At the beginning of the career, you may benefit from a chronological order resume or design a custom theme that fits the specifications of organizations where you want to apply for a social media marketing vacancy.

Since recruiters get a huge number of candidate resumes, you can get more visibility and an edge over other candidates with the help of an attractive document format. Before finalizing it, make sure you proofread the document for potential errors and spice it up with attractive designs to increase your chance of getting hired.

Is LinkedIn Still a Thing?

Launched in 2003 as a social network for professionals, LinkedIn has been going strong since its inception. It is one of the best websites to set up your professional profile and interact with professional experts from different fields.

LinkedIn facilitates you to share thoughts and knowledge with other users on the platform who might be interested in the insights you share. You can also have one-on-one chats with people via its secure private message service.

Since LinkedIn is getting old, it is rumored that this platform is losing its charm. However, it's an evergreen platform that is extremely useful in this era of technology.

Many recruiters prefer to invite and hire candidates via LinkedIn. It's because they can evaluate the person to some extent before the interview with the help of their profile

and the content they share. In fact, many recruiters conduct short interviews through LinkedIn to save time and make the recruitment process much simpler.

So, it's recommended for business professionals, especially marketers to create LinkedIn profiles. If you stay active and regularly post relevant and informative content, you can build relationships and get job offers with ease.

Going Solo

Working as a social media marketer with an expert team of professionals can offer you learning opportunities. You can get useful tips those team members learned through years of experience. They can also guide you about enhancing your skills and the right path for progressing in the industry.

However, taking up a full-time job isn't for everyone. You may have dreams of making your name as an established social media marketer and this dream can come true only by working solo and launching your entrepreneurial career.

You may want to become a freelancer and gradually set up your social media marketing agency once you build a network of business connections and clients.

Before starting your agency, you ought to develop a business plan that covers necessary information about the business such as potential customers, vendors, business strategy, financial resources to execute plans, and your team that can work hard for the future of the organization. You may want to invest in a professional website to build authenticity and credibility.

Building Your Portfolio

Whether you plan to take up a job as a social media marketer or aim to launch your social media agency, you need a portfolio. A portfolio is a set of previous work that demonstrates your skills.

When you send your resume to a potential employer, they would ask for your portfolio to determine how good you are at what you do. Similarly, this portfolio will prove helpful when you reach clients and offer your social media management services for their business or professional needs.

As a beginner at social media marketing, you may struggle to get your first job or assignment. You can create social media profiles for your freelancing journey. By managing these accounts the right way, you can show clients and recruiters that you are good at the job.

Furthermore, you can also present detailed insights into the performance of social media campaigns you may carry out to promote your personal brand.

YOLO

Social media marketing is the need of the hour. Not only does it help individuals stay connected, it also adds value to businesses with low cost and effective marketing methods.

Traditional marketing is still relevant, but digital marketing in general and social media marketing, in particular, is extremely helpful for entrepreneurs. It can be an invaluable asset for lead generation, raising brand awareness, engaging existing customers, and acquiring new customers at relatively lower rates.

However, social websites such as Facebook, LinkedIn, Twitter, and other platforms can be tricky. Not every marketer is able to get the desired results via social media marketing despite their familiarity with social media websites. This is because they ignore the basic principles of marketing, especially the marketing mix or 4 P's principle.

Social marketing works on the basis of these fundamental marketing principles and you need to rethink these concepts in the context of digital media to achieve your marketing goals.

The key to surviving in the digital world is to understand the needs and wants of your customers. When you know which platforms are most commonly used by your target audience, then you can stay active on those websites to increase your reach.

It's also essential to monitor the activities of your competitors. This practice helps you learn about the latest industry trends, identify your mistakes, and learn from those that have working in the marketing industry for quite a long time. You can update your social marketing strategy accordingly for better results.

Despite these tactics, your business may suffer if you blindly follow in the footsteps of the competition. You should rather develop an effective strategy that suits your particular needs.

For this purpose, you should first define your goals for social marketing campaigns and specify your target audience. The next step is to identify where these customers are mostly present and then create social media accounts on those websites. It's important to remember that you cannot and should not try to run marketing campaigns on every social media website or this approach will only backfire.

The next step is to develop a content strategy for these websites. You should know what kind of content is popular on each website so you can post it when most of your target

audience is online. You don't need to create fresh content for every website and can rather repurpose and reuse it to avoid wasting time.

Moreover, there are many tools or software available that can assist you in creating unique content and repurposing the existing information. You can use these tools to maintain a content calendar and schedule social media posts so they reach your target customers at the right time.

Social marketing efforts produce results when you stay up-to-date with performance. Social media built-in tools as well as external performance measurement software can give you detailed information about the performance of marketing campaigns. You can find out which activities are performing as per expectations and which tactics need to be revised. With the help of this information, you can update and revise the social media strategy for improved performance.

This book is the first step in the right direction and provides you with guidelines for prospering as a social media marketer. However, you can learn best by implementing these principles and activities on your own. Hands-on experience further clarifies concepts, gives you a better understanding of digital and social media marketing, and helps you get down to the nitty-gritty of modern marketing strategies.
